E. Torque Switches - Travel in the opening and closing directions shall be governed by a switch responsive to mechanical torque developed in seating the valve, or by an obstruction met in opening or closing. The torque switch shall be adjustable and shall function without auxiliary relays or other devices. Torque shall be adjustable from 40-100% of the actuator capacity, and adjustable in 1% increments, non-intrusively (no removal of covers).

F. Position Switches - Four contacts shall be provided which can be selected to indicate any position of the valve with each contact selectable as normally open or normally closed. The contacts shall be rated at 5A, 120V AC, 30V DC. Provision shall be made for 4 additional contacts should they be required or needed for the specified control.

G. Position Indication - The actuator shall provide a local display of the position of the valve and to track and monitor any manual operation of the actuator, even when the power supply is not present. The display shall be able to be rotated in 90° increments to provide easy viewing regardless of actuator mounting position. The local display shall be large enough to be readable from six (6) feet when the actuator is powered up. The actuator shall include a digital position indicator with a display indicating valve position from fully open to fully closed in 1% increments. Red, green, and yellow lights corresponding to Open, Closed, and Intermediate positions shall be included on the actuator.

H. The actuators transformer shall provide 24 VDC or 120 VAC power available for customer use.

I. Jammed valve protection: Torque switch and motor thermal protection shall be provided to prevent motor burn-out. Remote indication of availability/non-availability status of the actuator shall be provided for remote monitoring and control. Monitor relays shall be provided to detect a loss of local three phase or control voltage supply, motor thermostat trip, the local stop button locked off or the selector switch not set to the REMOTE position. Availability of the actuator for remote control shall be indicated by electrical contacts, series connected for all of the above conditions. These contacts shall be connected to a single interposing (monitor) relay integral with the actuator with dry contacts for remote wiring.

J. The remote-control signals shall be 24 VDC or 120 VAC without the need for additional relays.

K. The operator shall be wired in accordance with the schematic diagram and all wiring for external

connections shall be connected to marked terminals. The electric circuit diagram of the actuator shall not vary with valve type remaining identical regardless of whether the valve is to open or close on torque or position limit. Two 1-inch and one 1-1/4 or 1-1/2-inch conduit connections shall be provided in the enclosing case.

L. Handwheel Operation: A handwheel shall be provided for emergency operation engaged when the motor is declutched by a lever or similar means; the drive being restored to power automatically by starting the motor. The hand/auto selection lever shall be padlockable in both in Hand and Auto positions. It shall be possible to select hand operation while the actuator is running or start the actuator motor while the hand/auto selection lever is locked in Hand position without damage to the actuator.

M. The handwheel drive shall be mechanically independent of the motor drive, and any gearing shall be such as to permit emergency manual operation in a reasonable time. Worn or damaged gears shall not prevent manual operation. Clockwise operation of the handwheel shall give closing movement of the valve unless otherwise stated in the Contract specification. Valves mounted higher than 5 feet-6 inches above floor or operating level shall have chain operators and a remote-control station at ground level that performs all of the same functions as the actuator mounted station, and complying with all of the test laboratory, NEMA, and other ratings required for the actuator. Station shall be stand mounted per instrumentation mounting details found in the Contract Drawings.

N. For safety purposes, it shall be possible to disengage the electric drive with the declutch lever. This disengagement and any subsequent reengagement shall not cause any damage to the valve or actuator - even with the motor running.

O. The maximum torque required on the handwheel under the most adverse conditions specified herein shall not exceed 60 ft-lb, and the maximum force required on the rim of the handwheel shall not exceed 60 lb. An arrow and either the word "open" or "close" shall be cast on the handwheel to indicate the direction to turn for manual operation.

P. Motor: The motor shall be of the totally-enclosed, non-ventilated, high-starting torque, low-starting current type for full voltage starting or as otherwise required for modulating service. It shall be suitable for operation on 480-volt, 3-phase, 60-Hz input power, and have Class B insulation, and a motor frame with all dimensions in accordance with the latest revised NEMA Standards. The observed temperature rise by thermometer shall not exceed 55 degrees C above an ambient temperature of 40 degrees C when operating continuously for 15 minutes under full rated load, with a line voltage of not more than 10 percent above or 10 percent below the rated voltage, the motor shall develop full rated torque continuously for 15 minutes without causing the thermal contact protective devices, imbedded in the motor windings to trip or the starter overloads to drop out. All bearings shall be of the ball type and thrust bearings shall be provided where necessary. All bearings shall be provided with suitable seals to confine the lubricant and prevent the entrance of dirt and dust. Motor conduit connections shall be watertight. Motor construction shall incorporate the use of stator and rotor as independent components from the valve operation such that the failure of either item shall not require operator disassembly or gearing replacement. The actuator shall include a device to ensure that the motor runs with the correct rotation for the required direction of valve travel with either phase sequence of the three-phase power supply connected to the actuator. The motor shall be de-energized in the event of stall when attempting to unseat a jammed valve, or if single phasing occurs. Motor temperature shall be sensed by a thermostat to protect against overheating. For On/Off service, this starter shall be an electromechanical type suitable for 60 starts per hour and of a rating appropriate to the motor size. For modulating duty, a solid-state starter shall be supplied that is suitable for up to a maximum of 1,200 starts per hour. Instant reversal of actuator from one direction to another shall be protected by an automatic time delay circuit.

Q. Starter: There shall be furnished and installed in the integral weatherproof housing on the valve

actuator, unless otherwise shown, a suitably sized amperage rated reversing starter with its coils rated for operation on 120-VAC, 1-phase, 60-Hz current. A control power transformer shall be included to provide a 120-VAC source. The starter shall be equipped with 3 overload relays of the automatic reset type (NOTE! Space heaters are not required in properly sealed enclosures, per this revised specification).

R. Operator Appurtenances: The operator for each valve shall be supplied with a push button station with mechanical or electrical lockout device. The pushbutton station enclosure, if separate, shall also be rated for NEMA 4X environments and hazardous duty if needed to meet the arearequirements.

S. Terminal Compartment: A separate terminal compartment which is sealed from the rest of the actuator assembly, shall be provided as part of the actuator housing so that electrical components shall remain sealed (not exposed to the outside environment) during site wiring. The terminal compartment shall be O-ring sealed at the cover and also have an inner watertight and dustproof “O” ring seal between the terminal compartment and the internal electrical elements of the actuator, fully protecting the motor and all other internal components from ingress of moisture and dust when the terminal compartment cover is removed to perform wring on site. Enclosure shall be able to allow for temporary site storage without the need for temporary electrical power supply connection.

T. All external fasteners on the actuator shall be stainless steel and shall be lubricated with anti-seize compound to prevent galling. Threaded covers and other appurtenances shall also be lubricated with anti-seize.

U. Power terminals shall be of the stud type, segregated by an insulating cover. At least three conduit entries shall be provided, threaded with an NPT standard tap with 2/4 inch taper per foot. Fine stranded wire with solderless compression connectors (ring tongue type), shall be used for all electrical connections to the actuator. Terminals for remote controls shall be provided. No external wiring or conduit shall be used for interconnection of components on the actuator.

V. It shall be possible to carry out the setting of the torque, turns, and configuration of the indication contacts via an infra-red setting tool, without opening or removing any electrical compartment covers. Diagnostic information shall be available from both an integrally mounted display window and through non-intrusive means of reading and writing data to the actuator, Two way communication shall be possible to facilitate downloading actuator setup and reading/analyzing the “on board” Data Logger via an IrDA port and non-intrusive hand-held computer/PDA. Diagnostic information from the Data Logger shall include, as a minimum, historical valve torque profiles and an actuator events log that can be stored and analyzed. Provision shall be made to display valve torque demand as a percent of rated actuator torque and position simultaneously, in order to facilitate valve trouble shooting and diagnostics.

W. Closing and opening speeds: The electric actuators and motors shall be sized to close or open the valves at a speed of 12” per minute, unless otherwise shown on the drawings or spec. Startup Kit: Each actuator shall be supplied with a startup kit comprising of installation instructions, electrical wiring diagrams, and enough spare cover screws and seals to compensate for any site losses during the startup/commissioning period.

2.7 PENUMATIC ACTUATORS

A. The pneumatic actuators shall be used to modulate valves/dampers with a positioner. The pneumatic actuator shall have an integral pressure to milliamp transducer/positioner in order to be able to respond to analog signals of 4-20 mADC at 0 to 30 VDC. The actuator material shall be suitable for the environment that it will be operating in as well as requirements described in the attached design documents Contractor shall prepare and submit ISA data sheets to document compliance with specification requirements. All pneumatic tubing of the actuator shall

be 316 SS.

2.8 HYDRAULIC ACTUATORS

Refer to mechanical specifications.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. The Instrumentation Subcontractor shall utilize personnel provided by its assigned organization to accomplish, or oversee the physical installation of all elements, instruments, accessories or assemblies which it furnishes. The Instrumentation Subcontractor shall employ installers who are skilled and experienced in the installation and connection of all elements, instruments, accessories, and assemblies being furnished under this Contract.

B. In summary, it is the general intent of this Contract that all field cabling external to the Local Control panels shall be furnished and installed under provisions of Division 16 Electrical. Further, it is the general intent that all field wiring, i.e., 4-20 mA signal circuits, process equipment control wiring, signal wiring to field instruments, LCPs and PCM input and output wiring, be furnished and installed under Division 16 and be terminated and identified under provisions of Division 17 Instrumentation and Control.

C. The Instrumentation Subcontractor's attention is directed to the electrical and mechanical schematics and details of this project. Referral to these portions of the contract documents shall be required in order to understand the full intent and scope of work required.

3.2 CONTROL PANEL SIGNAL AND CONTROL CIRCUIT WIRING

A. Wiring Installation: All wires shall be run in plastic wireways except (1) field wiring, (2) wiring run between mating blocks in adjacent sections, (3) wiring run from components on a swing-out panel to components on a part of the fixed structure, and (4) wiring run to panel-mounted components. Wiring run from components on a swing-out panel to other components on a fixed panel shall be made up in tied bundles. These bundles shall be tied with nylon wire ties and shall be secured to panels at both sides of the "hinge loop" so that conductors are not strained at the terminals.

B. Wiring run to control devices on the front panels shall be tied together at short intervals with nylon wire ties and secured to the inside face of the panel using adhesive mounts.

C. Wiring to rear terminals on panel-mount instruments shall be run in plastic wireways secured to horizontal brackets run above or below the instruments in about the same plane as the rear of the instruments.

D. Conformance to the above wiring installation requirements shall be reflected by details shown on the shop drawings for the ENGINEER'S review and approval.

E. Wire Marking: Each signal, control, alarm, and indicating circuit conductor connected to a given electrical point shall be designated by a single unique number which shall be shown on all shop drawings. These numbers shall be marked on all conductors at every terminal using white numbered wire markers which shall be plastic-coated cloth, or permanently machine marked heat-shrink plastic and easily visible and readable.

3.3 INSTRUMENT CABLE TESTS

A. General: The following tests shall be performed on each instrumentation and control system cable which is installed under this Contract. All tests shall be end-to-end tests of installed cables with the ends supported in free air, not adjacent to any grounded object. Complete records of all tests shall be made and delivered to the ENGINEER for review and approval.

B. Continuity tests shall be performed by measuring wire/shield loop resistance of each signal cable as the wires, taken one at a time, are shorted to the channel shield. No loop resistance measurement shall vary by more than ±2 ohms from the calculated average loop resistance value.

C. Insulation resistance tests shall be performed by using a 1000 volt Megger for insulations rated 600V or higher and 500 volts Megger for insulations rated 500V or lower. Megohmmeter shall be used to measure the insulation resistance between each conductor , between each conductor and the conductor shield, between individual conductor shields in a multi-channel cable, between each individual conductor shield and the overall cable shield in a multi conductor cable, between each conductor and ground, and between each shield and ground. Values of resistance less than 1 megohms will be unacceptable. For further detail refer to electrical specifications.

3.4 INSTALLATION, CALIBRATION, TESTING, PRECOMMISSIONING, START-UP

A. General: All systems specified in the applicable Sections of Division 17, shall be installed, Connected/terminated, calibrated and tested, and in coordination with the ENGINEER, shall be started to place the plant processes in operation. This shall include final calibration in concert with equipment specified elsewhere in these Contract Documents, including pumps, samplers, valves and chemical feeders. The installation personnel shall have a final reviewed copy of the shop drawings and data.

B. Installation and Connection: Install and connect all field-mounted components and assemblies under the criteria imposed in this Section under "Manufacturer's Representative Services." The installation personnel shall have a final reviewed copy of the shop drawings and data.

1. The instrument process sensing lines and air signal tubing shall, in general, be installed in a similar manner to the installation of conduit specified under Division 16 specifications. Individual tubes shall be run parallel and near the surfaces from which they are supported. Supports shall be used at intervals of not more than 3 feet of rigid tubing.

2. Bends shall be formed with the proper tool and to uniform radii and shall be made without deforming or thinning the walls of the tubing. Ends of tubing shall be square-cut and cleaned before being inserted in the fittings. Bulkhead fittings shall be provided at all panels requiring pipe and/or tubing entries.

3. All instruments and connecting lines shall have allowance made for movement of equipment caused by seismic loading, vibration, or expansion or contraction caused by temperature changes. This shall be demonstrated to the ENGINEER during witnessing of field installation work prior to startup.

4. All accessory items required for installation and proper operation of the equipment shall be provided. Such items may include instrument valves, seal pots pigtails.

5. Lines or connections open to atmosphere shall be protected against ingress of foreign matter.

Unprotected openings shall have a goose neck, or equivalent, attached to protect against falling particles. Bird screen and insect screens shall be installed.

6. Comply with installation detail in the specifications for mounting of the instrument.

7. Verify that all Differential Pressure elements have three valve 316 SS manifolds.

8. All flexible cables and capillary tubing shall be installed in flexible conduits. The lengths shall be enough to withdraw the element for periodic maintenance.

9. All power and signal wires shall be terminated with spade type lugs.

10. All connectors shall be, as a minimum, watertight.

11. All wires shall be mounted clearly with identification tags at both ends that is of a permanent and reusable nature.

12. All wire and cable shall be connected from terminal to terminal without splices unless specifically approved by the ENGINEER and arranged in a neat manner and securely supported in cable groups. All wiring shall be protected from sharp edges and corners.

13. Verify that all mounting stand and bracket materials and workmanship comply with requirements set forth in the specifications and drawings.

14. Provide a technical field representative to instruct the installation personnel on any and all installation requirements; thereafter, the technical field representative shall be readily available by telephone to answer questions and supply clarification when needed by the installation personnel.

15. Finally, after all installation and connection work has been completed, the technical field representative shall check for correctness, verifying polarity of electric power and signal connections, making sure all liquid or pneumatic process connections are free of leaks, and all other similar details. The technical field representative shall certify in writing that for each loop or system checked out, all discrepancies have been corrected by the installation personnel.

16. Bear all costs and provide all personnel, equipment and materials necessary to implement all activities specified herein.

C. Process Connections: Process Connections and root valves shall be located so that they are accessible. Root valves stem and handle shall be installed clear of mainline insulation.

1. Consistent with measuring needs, process connections shall be located to have minimum movement. Therefore, they shall be as close to the system anchor points as possible.

2. For instruments mounted on a local board, the process connection shall be located as close as practical to the board.

3. Process connections in pipelines shall be oriented to avoid gas pockets in the sensing lines for liquid and vapor, and to avoid liquid pockets in the sensing lines for gas.

D. Valves: Root valves shall conform in design to the main-line class. If a globe-pattern root valve is used for pressure ranges of 0-15 psig, or differential pressure ranges of 0-100 inches H_2O, or vacuum service, its stem shall be installed horizontally. All other globe-pattern root valves shall have the stem vertical. All valves shall be full port ball where available.

1. Relief valves shall be installed without isolation valves.

2. To allow isolation of instruments, each instrument, EXCEPT FOR RELIEF VALVES, shall have a shutoff valve that is close to the instrument and is readily accessible. Where the root valve serves this purpose, instrument valves are not required.

3. If the root valve for a test point is not accessible, pipe or tubing shall be added and an instrument valve installed at convenient location.

E. Instruments: Locate locally mounted instruments near the most convenient point of use consistent with good measuring practice and accessibility. Sensing lines shall be as short as practical.

1. When consistent with good measuring practice, local boards or racks may be used to mount instruments that are grouped together because of common locations or related function.

2. Sensing instruments are preferred to be elevated as follows relative to the process connection in order to avoid gas pockets in a liquid-sensing line or liquid pockets in a gas or vapor sensing line:

Fluid	Preferred Instrument Elevation
Liquid	Below Line
Slurry	Below Line
Steam over 20 psia	Below Line
Steam not over 20 psia	Above Line
Gas	Above Line

3. Instruments and local boards shall not block walkways. For use, calibration, and repair, they shall be accessible without requiring instrument disassembly or the removal of piping, grating, or other structure.

4. Instruments shall be 4' - 6" above the floor. Exceptions may be made for seismic supports, for instruments accessibility, or for other factors, but must be approved by the ENGINEER prior to the work being done. Enough lighting shall be provided for night-time use.

5. Instruments shall be protected against shock and vibration. Because of vibration, electro-pneumatic signal converters shall not be mounted on control valves.

6. High temperature, high humidity and other ambient factors must be considered when locating instruments that require access for service.

7. Fluid-filled sensing systems, or "capillary tubes", are sealed to the instrument by the instrument manufacturer and are not repairable in the field. Such systems shall not be opened or cut during or after installation and shall be routed and protected as required to guard against damage. Avoid sharp bends in capillary tubing (i.e. bend radius shall not be less than 10 times the diameter of the capillary tubing). Excess lengths of capillary tubing shall be neatly coiled in a protected area or enclosure, e.g., coiled inside a protective shipping cap for 12-inch pipe.

8. Manufacturer's installation requirements, including those relating to unsupported span and minimum bend-radius of capillary tubing, must be submitted for review and approval by the ENGINEER.

9. All instruments shall have nameplates and tag numbers engraved on tags made of 316

stainless steel and attached with 316 stainless steel wire.

F. Sensing Lines: Sensing lines shall have a continuous slope to promote their being kept either full or free of liquid, as appropriate. The slope shall be one inch, or more, per foot of run. For instruments sensing steam at pressures up to 20 psia, 2 inches per foot of run is required as minimum.

1. If an instrument having a large dynamic displacement, e.g., a U-tube manometer, is in liquid service and is mounted above the main line, the sensing line shall descend for at least 36" close to the process connection and before sloping up to the instrument with the intent of preventing the entrapment of a non-condensable in the sensing line and shall be located below process taps.

2. If a sensing line has a liquid purge, the line shall be arranged so that the purge flow is up. If a gas purge is used into a process liquid, the purge flow shall be down.

3. Low points, except for pigtails, shall have a valved drain connection. Drip or dirt chambers shall be installed where needed. For dirty or freezing services, drain valves shall be a gate or ball type suitable for rod out.

4. High points shall have a vent connection with a manual or automatic vent valve except when the fluid is a non-condensable gas and except for pigtails. Not for U-Tube Manometers.

5. The discharge of bleed connections shall be piped to a safe disposal point if opening the bleed may create a hazard. The outlet of the valve on an atmospheric bleed shall not be plugged or capped, otherwise potentially hazardous pressure buildup may occur downstream of the valve.

6. Process fluids shall not be piped to a control room, or control panel, except instrument air, nitrogen, or other inert gas at pressure not exceeding 150 psig.

7. Dead-end sensing lines shall preferably be not over 50 feet long when using 1/4" O.D. tubing. The tubing diameter shall be increased to **½" O.D.** if a line is over 50 feet long or if the sensing instrument has a large dynamic displacement.

8. Hydrostatic head in a sensing line may affect a measurement. The effect of head shall be considered, particularly for low measuring ranges or low operating pressures.

9. Instruments in steam or vapor service shall have a pigtail or equivalent wet-leg to keep the instrument cool. The pigtail shall be close to the instrument. A wet-leg shall have a filling connection, usually at the top. If the instrument is mounted above the line, it shall be insulated up to the pigtail to minimize refluxing.

10. Use of a condensate pot may be necessary for any measured variable. If used, condensate and seal pots shall be located as close as possible to the process connection.

11. Pulsation dampers, when required, shall be installed close to the instrument, downstream of the instrument block valve.

12. Sensing lines shall be protected against mechanical loads and wear. Otherwise, additional wall thickness shall be required for mechanical strength. Unsupported spans of process and pneumatic tubing shall not exceed 3 feet in length.

13. Expansion bends shall be provided as necessary to allow for movement of supporting structures or change of length due to temperature change.

14. Hot lines shall be covered with insulation for personnel protection.

15. The main-line pipe class shall apply up to the instrument side of the root valve. Beyond that point, the appropriate instrument pipe class shall be used.

G. Fittings: Fittings shall not be used between the process connection and the root valve nor for pipe on the process side of condensate or seal pots, except that displacement and float-type level instruments are normally installed using pipe fittings.

1. So far as practical, bends rather than fittings shall be used to change the direction of a run of tubing or pipe. The minimum bending radius for cold-bending of tubing shall be three times the outside diameter of tubing. .

2. The ferrule of a flareless tube fitting shall be harder than the tube on which it is used.

3. Lubricant and sealant compounds shall be used as required by the city and equipment suppliers.

4. Where a detail specifies a size and type of fitting, a combination of fittings of other sizes but of the same or equivalent type giving the same or better overall effect may be substituted for convenience or if the desired part is not available. Flareless or threaded connections may not be used where weld connections are required. Where a ½" socket-weld fitting is required, a pipe 1/2" tube socket-weld fitting plus a 1/2" x 3/8" tube socket-weld fitting may be substituted. A flareless-end valve may be substituted for a threaded valve with flareless connectors, or vice versa. A weld fitting may replace a threaded or flareless fitting unless maintenance access will require the ability to make and break the connection. Each substitution shall require written approval of the ENGINEER.

5. Welding shall conform to project requirements.

H. Instrument Installation Notes - Flow: Condensate pots are not required for a sensing element, e.g., a force balance flow transmitter, which has negligible dynamic displacement. If displacement is not negligible, as for a U-tube manometer, and if the process fluid is either steam, other condensable fluid, water hotter than 250 Deg. F, other fluid that may flash, or moisture laden air then condensate pots shall be used. The pots shall have a volume not less than three times the displaced volume.

1. A pair of condensate pots shall be at the same elevation and as high as, or higher than, the higher process connection.

2. The pipe from a process connection to a condensate pot shall be insulated for process fluids hotter than 250 Deg. F.

3. A pair of head-type sensing lines shall be run together to the maximum extent practical so as to keep both lines at the same temperature. If they are to be insulated, they shall be insulated together.

4. Head-type sensing lines shall be checked to make sure that they are connected to the proper sides, HP and LP, of the instrument.

5. The edges of the holes for orifice taps shall be square or slightly rounded, clean, and free

from burrs, wire edges, or other irregularities.

6. For all Differential Pressure type elements, use a 316 SS five valve manifold.

7. Flow meter Installation Criteria: The following table lists the straight pipe run requirement upstream and downstream of each type of meter in terms of the number of required pipe diameters.

TYPE	UPSTREAM	DOWNSTREAM
Orifice plates	20	5
Venturi Tubes	20	5
Pitot Tubes	40	10
Propeller Meters	15	4
Ultrasonic Meters	10	5
Magnetic Meters	5	3

I. Instrument Installation Notes - Level: The lower connection on a vessel for piping to a level instrument is preferred to be on the side of the vessel rather than to come vertically down from the bottom. The intent is to minimize the trapping of solids in the sensing lines.

1. Head-type level instruments shall be located below the process connections on the vessel unless a gas purge is used, in which case the instruments may be located at any convenient elevation.

2. A stilling well shall be used in all cases to reduce the turbulence for displacement type elements located inside a vessel. A well may be required to protect a bubble tube against excessive turbulence.

3. So far as practical, level devices shall be placed away from areas of turbulence and shall not interfere with other vessel parts or instruments, such as thermowells or sample nozzles that may be required.

4. Stilling wells and bubble tubes shall be firmly supported. Head room shall be provided to permit withdrawing the tubes for cleaning and maintenance.

5. Gage glasses and their associated level instruments shall be installed adjacent to each other. The gage glasses and the other instruments shall be visible from a walkway.

6. External-chamber level instruments shall be installed with main-line-class pipe. Gate valves shall be used for root valves and other shutoff valves for these instruments, except that the manufacturer's standard pattern may be used for gage-glass valves.

7. An external-chamber instrument or a differential-pressure-type instrument used to measure level in a vessel that is open to atmosphere may have one of its input connections, as appropriate, open to atmosphere instead of being connected to the vessel. An external-chamber instrument thus installed may require additional bracing.

8. A pair of sensing lines for head-type level measurement shall have an equalizing manifold with bleed valves. Because of support problems, commercial manifold assemblies having flanged outlets shall not be used in seismic applications. In other applications, their use is not recommended for the same reason.

9. The usual level-instrument connections on vessels are:

Head-type instruments:	
Piped	3/4"
Flanged-mounted	3"
Float or Displacement-type Switches	1-
1/2" Displacement-type Transmitters and Controllers:	
External	1-1/2" or 2"
Internal	4"
Multi-instrument standpipes	3"

10. Displacement and float-type level instruments shall be placed as close as possible to the vessel to improve response. If any external-chamber instrument or a standpipe unavoidably cannot be located close to the vessel, the size of the connecting pipes shall be enlarged to facilitate the transfer of liquid on level changes, thereby reducing the loss of response caused by the long sensing and equalizing lines. The ENGINEER shall review and approve such installation.

J. Instrument Installation Notes - Pressure Differential: Condensate pots are not required for a sensing element, e.g., a force-balance transmitter that has negligible dynamic displacement. If displacement is not negligible as for a U-tube manometer, and if the process fluid is either steam, other condensable fluid, water hotter than 250°F, or other fluid that may flash, then condensate pots shall be used. The pots shall have a volume not less than three times the displaced volume.

1. A pair differential-pressure sensing lines shall be run together to the maximum extent practical to keep both lines at the same temperature. If they are to be insulated, they shall be insulated together.

2. A pair of condensate pots must be at the same elevation and as high or higher than the higher process connection.

3. The pipe from a process connection to a condensate pot shall be insulated for process fluids hotter than 250°F.

4. The differential-pressure sensing lines shall be checked to make sure that they are connected to the proper sides, HP and LP, of the instrument.

5. A pair of differential-pressure sensing lines shall have an equalizing manifold with bleed valves. Because of support problems, commercial manifold assemblies having flanged outlets shall not be used in seismic applications. In other applications, their use is not recommended for the same reason.

K. Installation – Pressure gauges; All gages and appurtenances shall be installed at the locations shown in the Contract Documents and in accordance with the manufacturer's printed instructions.

1. Care shall be taken to minimize the effect of water hammer or vibrations on gages. Gages shall be filled with oil.

2. Where indicated or necessary for proper operation, gages shall be mounted independently of vibrating piping or machines, and connected to the process with diaphragm seals, snubbers, and flexible capillary tubing.

L. Instrument Installation Notes - Pneumatic: Air supply headers shall be sized as noted on the P&ID. Air-supply branch taps shall come off the top of the header but may come off the side if necessary.

1. Lines for air that is not dry shall be sloped. Dry air lines shall be sloped where possible. Low points shall have drain connections. Air header drains shall be 1/2" size.

2. Branch isolation valves shall be installed as required to reduce interdependence of branches and to facilitate maintenance.

3 Each pneumatic instrument shall have a local 5-Micron air filter, which may be part of an air set if the supply pressure is required to be reduced. When pressure is reduced for an instrument, a relief valve, which may be integral with the reducing regulator in an air set is generally required. The regulator shall be provided with a small output-pressure gage if the instrument does not have a supply-pressure gage.

4. Lubricated air may be required for certain piston actuators or other devices But shall not be used for any other pneumatic devices. If necessary, use a local lubricator.

M. Instrument Installation Notes - Temperature: Non-standard wells are not allowed to be connected to the process pipe or vessel. It is necessary to make sure that there is internal clearance for insertion and that no excessive obstruction to flow is created.

1. Direct-connected readout instruments, e.g., thermometers or indicating transmitters, shall be located near the most convenient point of use consistent with good measuring practice.

2. Filled-system temperature instruments shall follow the manufacturer's limitations, if any, regarding (a) relative elevations of bulb and measuring instrument, and (b) ambient temperatures.

3. Pressure and Temperature instruments shall be installed to minimize exposure to shock, vibration, and radioactivity, and to avoid temperature extremes.

4. Instruments shall not block walkways. For use, calibration, and repair, they shall be accessible without requiring instrument disassembly or the removal of piping, grating, or other structure.

5. Where a pipe is reduced or enlarged for a temperature connection, consideration shall be given to the orientation of the pipe and the possibility of the change of pipe size causing high- or low-point pockets that may affect the measurement by entrapment of material or that may accumulate a radioactive substance.

6. Temperature connections shall be located to provide external clearance for insertion and removal of their sensing elements.

7. The materials and pressure-temperature ratings of pipe fittings used for temperature connections shall conform to the applicable pipe class.

8. Welding shall conform to project requirements.

9. A temperature-well connection to a pipe, which is made by weld-attachment of a fitting or nozzle, shall be drilled to have a hole approximately the same size as the inside

diameter of the fitting or nozzle. The intent is to provide clearance for insertion of the well and to minimize the entrapping of fluid.

10. For threaded connections of stainless steel to stainless steel, lubrication is required to prevent seizing and galling.

11. Filled-system temperature elements shall be sealed to the instrument by the instrument manufacturer and are not repairable in the field. Filled systems shall not be opened or cut during installation and shall be routed and protected as required to guard against damage. Excess lengths of capillary tubing for filled systems shall be neatly coiled in a protected area or enclosure, e.g., coiled inside a protective shipping cap for 12 inch pipe, preferably avoiding ambient temperature extremes.

12. Manufacturer's installation requirements, including those relating to unsupported span and minimum bend-radius of capillary tubing, shall be followed.

N. Calibration: Analog instrumentation and control system equipment shall be calibrated and tested after installation to verify that control system requirements are satisfied.

1. The Instrumentation Subcontractor shall provide all necessary labor, tools, and equipment to calibrate and test each instrument in accordance with the manufacturer's specifications and instructions.

2. Each instrument shall be calibrated at a minimum of five points using test equipment to simulate inputs and read outputs. A fewer number of calibration steps may be used for selected instruments if prior written approval has been obtained from the ENGINEER.

3. All test equipment and instruments used to simulate inputs and read outputs shall be suitable for the purpose intended and shall have a current calibration record certified to an accuracy greater than that required for the instrument under test. Such test equipment shall have accuracy traceable to the National Bureau of Standards as applicable. All analog instruments shall be calibrated and tested in place without removal.

4. All test data shall be entered on test forms that verify compliance with all applicable contract accuracy requirements, instrument manufacturer published performance specifications, and permissible tolerances at each point of calibration.

5. A report shall be delivered to the ENGINEER for each instrument, certifying that the instrument has been calibrated, in the presence of the ENGINEER or the ENGINEER's designated representative and meets contract and system requirements. The report shall include but not be limited to pertinent manufacturers name plate data, units span setting, any error in percent at each test point, switch and alarm set points, valve stroking and controller balancing information.

O. Analog/Digital Loop Tests: The Instrumentation and Control System Subcontractor shall provide all necessary labor, tools, and equipment to field test, inspect and adjust each instrument installed under this contract to its specified performance requirement in accordance with manufacturer's specifications and instructions. Any instrument furnished by the Instrumentation and Control System Subcontractor which fails to meet any Contract requirement, or any published manufacturer performance specification for functional and operational parameters, shall be repaired or replaced, by Instrumentation Subcontractor at no cost to the CITY. The Instrumentation and Control System Subcontractor shall bear all costs and provide all personnel, equipment and materials necessary to implement all installation tests and inspection activities specified herein.

1. At least 15 days before the anticipated initiation of installation testing, the Instrumentation and Control System Subcontractor shall submit to the ENGINEER a detailed description, in duplicate, of the installation tests to be conducted to demonstrate the correct installation of the instrumentation and control system and the anticipated dates the testing will occur.

2. Elements such as controllers, electronic function modules, shall be tested and exercised by the Instrumentation Subcontractor to demonstrate correct operation, first individually and then collectively as functional analog networks. Each hardwired analog control network shall be tested to verify proper performance within specified accuracy tolerances. Specified accuracy tolerances for each analog network shall be defined as the root-mean-square (RMS) summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified by contract requirements or by published manufacturer accuracy specifications, whenever contract accuracy requirements are not specified.

3. Each analog network shall be tested by applying simulated analog/digital and/or discrete inputs to the first element(s) of an analog/digital network (i.e., applying simulated analog and/or discrete signals to element(s) of the network; e.g., controllers, alarms, indicators, valve operators). For networks which incorporate analog elements, simulated sensor inputs corresponding to 10 percent, 50 percent, and 90 percent of span shall be applied, and the resulting element outputs read to verify compliance to calculated root-mean-square- summation accuracy tolerance requirements. Continuously variable analog inputs shall be applied to verify the proper operation and setting off discrete devices (i.e., alarms). Provisional settings shall be made on controllers, alarms, during analog loop tests. All analog loop test data shall be recorded on test forms, which include calculated root-mean-square-summation system accuracy tolerance requirements for each output.

4. Air systems shall be tested for leaks in compliance with ISA RP7.1. When installation tests have been successfully completed for all individual instruments and all separate analog control networks, a certified copy of all test forms signed by the ENGINEER or the ENGINEER's representative as a witness, with test data entered, shall be furnished to the CITY together with an unequivocal statement that all instrumentation has been successfully calibrated, inspected, and tested.

5. Digital loops shall be tested for loop integrity and on/off function.

P. System Pre-commissioning: The Instrumentation and Control System Subcontractor shall submit an instrumentation and control system Pre-commissioning Completion Report, which shall state that all Contract requirements have been met and shall include a listing of all instrumentation and control system maintenance/repair activities conducted during the pre-commissioning testing. Acceptance of the instrumentation and control system pre- commissioning testing must be provided in writing by the engineer before the seven day operational testing may begin. Pre-commissioning shall commence after acceptance of all wire, calibration and loop tests, and all inspections have demonstrated instrumentation and control system compliance with all contract requirements. Pre-commissioning shall demonstrate proper operation of all systems under this Contract with process equipment operating over full operating ranges under actual operating conditions.

1. All pre-commissioning and test activities shall follow detailed test procedures, check lists previously developed by the Instrumentation and Control System Subcontractor and reviewed and accepted by the ENGINEER. All test data shall be acquired using equipment as specified and recorded on test forms, previously reviewed by the ENGINEER, which include calculated tolerance limits for each step. Completion of all system pre-commissioning and test activities shall be documented by a certified report, including all test forms with test data entered, delivered to the ENGINEER with a clear and unequivocal statement that all system pre-commissioning and test requirements have been satisfied.

2. Proper operation of all final control elements, control panels and instrumentation furnished under this Contract shall be verified by tests specified herein. Where feasible, system pre-commissioning activities shall, to the greatest extent possible, simulate normal final control element operating conditions in terms of applied process loads, operating ranges and environmental conditions (e.g. using water). Final control elements, control panels, and ancillary equipment shall be tested under start-up and steady-state operating conditions to verify that proper and stable control is achieved using motor control center and local field mounted control circuits. All hardwired and software control circuit interlocks and alarms shall be operational. The control of final control elements and ancillary equipment shall be tested using both manual and automatic (where provided) control circuits. The stable steady-state operation of final control elements running under the control of field mounted automatic analog controllers or software based controllers shall be assured by adjusting the controllers, as required, to eliminate oscillatory final control element operation. Transient stability of final control elements operating under the control of field mounted, and software based automatic analog controllers shall be verified by applying control signal disturbances, monitoring the amplitude and decay rate of control parameter oscillations (if any) and making necessary controller adjustments, as required, to eliminate excessive oscillatory amplitudes and decay rates.

3. All electronic control stations incorporating proportional, integral and/or differential control circuits shall be optimally tuned, experimentally, by applying control signal disturbances and adjusting the gain, reset and/or rate setting(s) as required to achieve a proper response. Measured final control element variable position/speed setpoint settings shall be compared to measured final control element position/speed values at 25 percent, 50 percent, 75 percent and 100 percent of span and the results checked against specified accuracy tolerances. Specified accuracy tolerances are defined as the root-mean-square-summation of individual component accuracy requirements. Individual component accuracy requirements shall be as specified in the Contract or as specified by published manufacturer accuracy specifications whenever Contract accuracy requirements are not specified.

Q. 30-Day Operational Testing: The Instrumentation and Control System Subcontractor shall provide start-up support to include the Instrumentation and Control System Subcontractor's personnel, electrical personnel, and any instrument manufacturers' representatives as required during the testing period to produce a fully operational system. This support shall be provided at no additional cost to the CITY.

R. Record Drawings: Keep current an approved set of complete loop and schematic diagrams which shall include all field and panel wiring, piping/tubing runs, routing, mounting details, point-to-point diagrams with cable, wire, tube and termination numbers. These drawings shall include all instruments and instrument elements for the complete instrument loop as furnished under Divisions 11, 13, 15, 16 and 17 of this Contract. Drawings shall be a record of work as actually constructed and shall be prepared and submitted as specified in the GENERAL REQUIREMENTS.

3.5 INSTRUMENT LOOP DESCRIPTION -- SEE LOOP DESCRIPTIONS in the drawings.

3.6 INSTRUMENT AND I/O SUMMARIES - SEE INSTRUMENT SUMMARY, included in the drawings.

A. General: An Instrument and I/O Summary has been compiled for most instruments specified to be furnished under this contract.

B. This index is intended to complement the plans and specifications and shall not be construed as representing a complete itemization of instruments specified to be furnished under this contract. Instruments not presently included in the index, but which can be inferred from the Contract Documents and/or are required elsewhere herein shall be included and incorporated into the

instrument and I/O summary.

3.7 INSTRUMENT DATA SHEETS - Contractor shall prepare and submit instrument data sheets for instruments specified to be furnished under this project. Data sheets are intended to complement the Instrument and I/O Summary, plans and specifications.

3.8 CALIBRATION FORMS – Contractor shall prepare and submit calibration forms for instruments specified to be furnished under this contract.

END OF SECTION

SECTION 17450
SCADA, PLCS, NETWORK AND COMMUNICATIONS

PART 1 -- GENERAL

1.1 THE REQUIREMENT

A. This section specifies requirements for PLCs, SCADA, networks, and data communications shown on the drawings.

B. The Contractor shall furnish, install, configure, test, and document, all copper and fiber-optic communications network systems, including cables, switches, firewalls, software, and software licenses. The work includes accessories and appurtenances needed to provide reliable communications systems, as specified.

C. Operator HMIs

1. The System Integrator shall create an overview display for the stormwater diversion system at the new Honeywell, or equal, HMI (in LCP-01) attached to the new ControlEdge PLC. Display screens to include alarms, trending, and provide gate control.

2. Venice pump station will monitor the PLC, via the new EPL connection. As part of the scope of this project, the LCP-01 HMI displays will be replicated on the Venice station's new Honeywell, or equal, DCS. The Contractor will provide an Allowance for Honeywell to perform Venice configuration and testing.

D. The Ethernet Private Line (EPL) communications will be provided between LCP-01 and Venice Pump Station. The Contractor to coordinate with the City to arrange installation and testing of the EPL communications line and mounting of the Service Provider's EPL modem/router and associated fiber-optic patch panel.

E. SCADA configuration at Venice Pump Station

1. Contractor and System Integrator shall coordinate with City and Honeywell, or equal, control system staff for implementation of control strategies, graphic user interface screens, alarming, reports, and communication connectivity.

2. Contractor and System Integrator shall lead a minimum of two (2) workshops with City to coordinate PLC and HMI approaches and interface requirements.

3. Contractor and System Integrator shall lead a minimum of two (2) field testing sessions to verify stormwater diversion controls and displays at Venice Pump Station.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Other Sections of the Specifications, not referenced below, shall also apply to the extent required for proper performance of the WORK of this Section.

1. All Division 16000 Sections.

2. Section 17400 Process Instrumentation and Controls.

1.3 REFERENCE SPECIFICATIONS, CODES AND STANDARDS

A. The following documents referenced shall mean:

1. EIA Electronics Industry Alliance

2. TIA Telecommunications Industry Association

3. NEC National Electric Code. NFPA 70

4. NECA National Electrical Contractors Association

B. Comply with the applicable provisions of the latest edition of the following standards for design, materials, installation, and testing:

1. TIA/EIA-568-B Telecommunications Cabling Standard.

2. ANSI/ ICEA S-83-596 Optical Fiber Premise Distribution Cable.

3. ANSI/ ICEA S-87-640 Optical Fiber Outside Plant Communications Cable.

4. ANSI/ NECA 301 Standard for Installing and Testing Fiber Optic Cable.

5. TIA/ EIA-526-7 Measurement of Optical Power Loss of Installed Single Mode Fiber.

6. Bellcore GR-20-Core Generic Requirements for Optical Fiber and Optical Fiber Cable.

7. TIA/ EIA 568-B Telecommunications Cabling Standard.

1.4 SUBMITTALS

A. See submittal requirements of Section 17400 “Process Instrumentation and Control”.

B. Furnish submittals including shop drawings, product literature and datasheets,

C. Network and communications test plans: Submit a detailed test plan including the following:

1. Media to be verified and test methodology.

2. Test equipment to be used with calibration certificate.

3. Testing Procedures.

4. Network diagrams.

D. Control Systems testing procedure. See Section 17400.

E. The Shop Drawings: The shop drawings shall include a full description of the PLC system, including documentation of operation theory, programming methods, i.e. ladder logic diagram (All contacts, coils, timers, latches and each section of the ladder shall be clearly annotated and defined. The annotation of each of the input contacts representing a field device shall clearly define the status of the device.), data codes and security features, maintenance and trouble-shooting information. Schematics of all cards or units within the system along with point-to-point wiring diagrams shall be furnished after award of contract.

1. The documentation shall, also, provide a sequential flow chart of the logic implemented. The format of the flow chart and the annotation shall be proposed for acceptance by the ENGINEER before implementation.

2. Two sets of the program and documentation shall be forwarded for review and comments at least 30 days before factory test.

3. Control system architecture and interconnection cabling diagrams for the complete system. Include each cable fiber and copper network cable connection.

F. Product Data

1. Manufacturers brochures with proposed materials and options clearly marked.

2. Data sheets, including catalog numbers with code for determining catalog number code. Include data sheets for all cabinet components, instruments, cables, Ethernet switches, firewalls, and cable management.

3. Manufacturer’s installation instructions for equipment proposed.

4. Submit results of an un-witnessed test performed prior to the witnessed test. Any deficiencies found are to be noted and corrected before the witnessed test. Unwitnessed Test Results together with any re-testing, to be signed by Contractor as being correct.

G. Test Report results: Submit a hardcopy report for approval by the Engineer:

H. O&M Manual: Include in the submitted O&M Manual the following as a minimum:

1. Manufacturers network device data sheets and installation instructions.

2. System Network Diagram showing device model numbers and network addresses.

3. Documentation of all final device configuration settings, IP addresses and passwords.

1.5 QUALITY ASSURANCE

A. Training: A manufacturer's representative shall supply 40 hours of on-site training if required, for CITY personnel. The training shall include, but not be restricted to, operation of programming unit, trouble shooting of system hardware, software, and program development.

B. Communications system installer qualifications: The communications system installer shall:

1. Demonstrate direct experience with installation and testing of communications systems on at least two similar recent projects in the last three years.

2. Utilize qualified, experienced personnel, familiar with the design, installation, and configuration of communications systems.

3. Provide special tools and equipment needed for the installation and testing of the communications system, including but not limited to tools for terminating and testing copper/fiber-optic cables, jack stands for cable reels or cable winches, and OTDR testing

1.6 COMMUNICATIONS WITH VENICE PUMP STATION

A. The Contractor to coordinate with the City of LA and the selected Ethernet Private Line (EPL) Service Provider, to install and test the communications link to Venice Pump Station.

B. The Contractor shall install the Service Providers modem and fiber-optic patch panel in the Local Control Panel (LCP-01).

C. The Contractor to coordinate with Honeywell, or equal and the Engineer/ City to provide PLC register data to allow proper configuration of the SCADA screens at Venice Pump Station and testing of the communications link to the station.

D. The City’s Information Technology Agency (ITA) is responsible for selecting and contract with the EPL Service provider to establish the communications link.

PART 2 -- PRODUCTS

2.1 PROGRAMMABLE LOGIC CONTROLLER HARDWARE

A. PLC hardware shall be Honeywell, or equal – ControlEdge 900 platform, no equal, and provide the following features:

1. All PLC components, including power supplies, racks, CPUs, memory, I/O modules and cables shall be standardized to minimize the spare parts inventory and maximize interchangeability, and to conform to the City's LAWINS Standards.

2. All I/O modules shall be installed with appropriate type and size of Remote Termination Cables (RTP) and associated RTP module for field wiring terminations.

3. All CPUs shall have 16MBIts non-volatile memory for retention of key programming.

4. Each PLC shall have the ability to provide 4GBits of Dynamic memory capacity (RAM) and 2GBits of Program memory capacity (Flash)

5. Each PLC shall have the ability to operate in redundant or non-redundant modes and shall have the capability of a maximum of thirty-one (31) I/O bases and 372 Slots.

6. Each PLC shall be provided with redundant power supplies and shall be sized as required for I/O and field requirements. Power supplies shall provide a minimum of 5VDC @ 3.0A and 24VDC @ .6A. Power supply shall be Honeywell, or equal, 900P01-0101.

7. Input power: 120VAC, 60Hz

B. PLC Hardware shall be:

Honeywell, or equal, ControlEdge PLC Hardware		
Part Number	**Manufacturer**	**Description**
900CP1-0200	Honeywell or Equal	Control Processor Module (CPM), ControlEdge 900
900SP1-0200	Honeywell or Equal	Expansion Processor Module (EPM), ControlEdge 900
900R12-0200	Honeywell or Equal	12 I/0 Slot Rack
900P01-0301	Honeywell or Equal	120/240 VAC. 60W Rack Power Supply
900G32-0101	Honeywell or Equal	Digital Input, 24 VDC, 32 Channel
900H32-0102	Honeywell or Equal	Digital Output, 24 VDC, 32 Channel
900A16-0103	Honeywell or Equal	Analog Input High Level, 16 Channel
900B01-0301	Honeywell or Equal	Analog Output, 0 to 20 mA, 4 Channel
900TCK-0200	Honeywell or Equal	Digital I /0 - A/I - Terminal Block
900TEK-0200	Honeywell or Equal	Analog Output - Terminal Block
900TNF-0200	Honeywell or Equal	Filler Block Cover, Spare I/0 Slot

1. PLC I/O modules shall be Honeywell, or equal, Universal Input/Output Module (900U01-0100), or equal.

2. Interposing relays shall be provided for all relay outputs

2.2 HUMAN MACHINE INTERFACE HARDWARE (HMI-100)

A. The Where required, panel mounted HMI shall be Honeywell, Model HC 900 family, or equal.

B. The panel mounted HMIs shall have a keypad and touch-screen, including dedicated membrane keyboard to access up to 80 preformatted graphic displays.

C. The display screen shall be a minimum of 10.4” LCD color screen.

D. The HMI shall be capable of communicating with the PLC via an Ethernet TCP/IP or Modbus TCP connection.

E. Input power: 120VAC, 60Hz via 24VDC Power Supply.

2.3 PLC AND HMI PROGRAMMING DEVELOPMENT SOFTWARE

A. The PLC programming software shall be Honeywell, or equal, ControlEdge Builder– Latest Revision

1. The PLC programming software version for the PLCs shall be certified to run on the latest version of Microsoft Windows.

2. The PLC programming software shall comply with the International IEC 61131-3 standard and support Ladder Diagram, Sequential Function Chart and Structured Text programming language formats.

B. The HMI programming software shall be Honeywell MasterLogic ”Station Designer” for HC 900 family, or equal – Latest Revision

1. The HMI programming software version shall be certified to run on the latest Microsoft Windows platform.

2. The HMI programming software shall be capable of directly accessing tag information in the PLC by using the tag name, and not the memory address.

2.4 PLC APPLICATION OF SOFTWARE DESIGN CRITERIA

A. PLC Program Design:

1. CONTRACTOR shall organize the PLC application software into:

a. Sections

1). Contains all sequential control logic for a specific unit of operation

2). Each section consists of a general logic subsections, followed by unit operation subsections.

b. Subsections: Contains all sequential control logic for specific equipment such as a pump, valve or loop.

2. Program Documentation

a. Note and describe start of a new program section.

b. Annotate the PLC program

c. Briefly describe the control objectives.

d. Identify subsections
e. Subsection documentation includes brief description of control objective followed by a description and tag of the equipment being controlled

f. CONTRACTOR shall provide an, internal or external, organizational index for PLC application software that can be used to quickly search and locate a specific section, such as:

1). Flow, pressure and other process variable monitoring

2). Control valve or VFD PID control

3). Unit pump control

4). Unit blower control

5). Alarms

6). Data communications

7). System time-synchronization

8). PLC program initialization

g. The PLC program shall be able to initialize and bring a PLC unit from an inactive condition (e.g., power failure or hardware reset) to a state of operational readiness. Initialization shall include determination of system status prior to start-up of the operating system software and application software. Initialization shall also include the loading of all memory resident software, operator-entered setpoints, timers, counters, queues and all dynamic database values. For example, existing operator-entered setpoints shall not require operator re-entry after a power failure or after the downloading of a new PLC program.

2.5 HMI APPLICATION SOFTWARE DESIGN

A. General:

1. CONTRACTOR shall develop and submit HMI application software in accordance with ASM guidelines and in strict accordance with these requirements.

2. The following items outline the key objectives in designing the HMI graphic displays:

a. Easily navigated menus

b. Provide no more than three (3) mouse actions to navigate to any graphic display

c. Maintain consistency in graphic display and controls design

d. Maintain consistent and predictable window operations

e. Accurate representation of the facility and its operation

f. Represent control options in an easily understood fashion

g. Wherever possible, design overview displays similar to the physical layout of the facility. The perspective to the physical layout should be from the local main control room.

h. Provide operator access to process and alarm setpoints, including the following:

1). Process alarms (High-High, High, Low, and Low-Low)

2). Control setpoints.

3). Process timer setpoints

4). Sequence setpoints for volume, level, time, etc.

5). Set or correct the time and date of the Real Time Clock for both the PLC and HMI. The time and date of both the PLC and HMI shall be synchronized to the DCS clock once per day.

i. Provide an alarm/event screen with listing of current and historical alarms and events, e.g., operator login/commands/set-point entry, change in pump/blower/equipment status, including descriptions, times of occurrence, operator acknowledgement and return to normal status.

j. Configure the HMI to provide four levels of user access security.

1). Visitor: View screens only

2). Operator: View screens, enter process setpoints, and select equipment configuration.

3). Supervisor: All access provided to an Operator, but in addition ability to change alarm setpoints and PID controller parameters.

4). Administrator: Access to all functions.

B. HMI's graphics screens shall be programmed to comply with City (WINS) latest HMI standards including symbols, colors, layout, navigation. Provide the following:

1. Overall Facility Layout Operating/Monitoring/Troubleshooting screens.

2. Log – in screen.

3. Process status screen (s).

4. Plant configuration screens.

5. Setpoint entry screens.

6. Alarm logs.

7. Event log.

8. Maintenance screen.

9. Communication screen.

10. Trend screen.

11. Report screens.

12. All screens shall have top three lines to display latest alarms, with date and time stamp, with navigational buttons for navigating between screens.

13. Screen graphics presentation to follow the recommendations of ISA-101, and the existing plant SCADA screens symbols, color scheme, and alarming.

14. Provide pop-up windows for: mini-trends.

15. Provide active page connectors for navigation.

C. Provide pre-configured local trend displays of the following historical data with a choice of time ranges of at least 1hr, 4 hrs, 24 hrs and 7 days.

1. Stormwater diversion flow together wetwell and/or basin level.

2. Pump on/off together with pump discharge flow and pump kW.

3. Facility kW (15 minute average) and kW/1000 gallons of pump discharge flow.

D. PLC/HMI I/O DATABASE

1. CONTRACTOR shall segment all I/O and cards to increase the reliability of all systems and limit any single I/O card failure causing an outage.

2. CONTRACTOR shall provide, coordinate, manage and document a PLC Database in accordance with LAWINS tag naming conventions. The Database shall have the following functions:

a. The database shall contain all the fields necessary to configure the various points including the following per point type:

1). Discrete Point configuration: CONTRACTOR shall provide a PLC/HMI Discrete I/O database of all the analog and discrete points. The I/O list includes the following fields:

a). Loop Number

b). Tag number

c). Type

d). Point description

e). Alarm Description 1

f). Alarm Description 2

g). Closed Condition Input: Description of the state of the input parameter of device when the field or internal PLC contacts are in the CLOSED position.

h). Open Condition Input: Description of the state of the input parameter of device when the field or internal PLC contacts are in the OPEN position.

i). Closed Condition Output: Description of the state of the output signal in the CLOSED condition

j). Open Condition Output: Description of the state of the output signal in the OPEN condition.

k). PLC name and/or number

l). PLC network address

2). Analog Point Configuration: CONTRACTOR shall provide a PLC/HMI I/O database of all analog points that are communicated to and from the DCS and the HMI. The analog I/O database shall include, but is not limited to, the following fields:

a). Attributes that further define the function of the points as listed below: Note that the attributes will be used for sorting and development of the I/O driver configuration. Additional attributes shall be developed to meet the software needs:

i Setpoint read
ii Setpoint write
iii Process variable
iv Flow totalizer read
v Equipment run time

b). Point description

c). Alarm description 1

d). Alarm description 2

e). Engineering units

f). Scale range

g). Alarm ranges:
i High-High
ii High
iii Low
iv Low-Low
v Signal fail
vi Rate of Change
vii Other

h). PLC number

i). PLC I/O hardware address

j). PLC I/O memory address

E. System Growth

1. Contractor shall provide twenty (20) percent spare capacity. Spare capacity shall be based on current ‘equipped’ I/O counts

F. Operations and Maintenance Manuals: Furnish to the ENGINEER 10 complete sets of Operation and Maintenance manuals. The manuals shall include data sheets, catalog cuts, approved shop drawings, manufacturer’s technical manuals, information drawings, etc., for the system, subsystems, and all components, and shall include names, addresses and telephone numbers of equipment suppliers, representatives and repair facilities.

1. This shall include a complete description of the recommended operating procedures, maintenance procedures, and spare/replacement parts list for equipment items with catalog data, diagrams, and drawings or cuts describing the equipment..

2. Each set shall include full size assembly and wiring diagrams; drawings showing "as built" conditions shall be furnished to the CITY

2.6 PLC PANEL

A. Refer to Section 17400 “Process Instrumentation and Control”.

B. Provide 316 stainless steel NEMA 4X PLC cabinet with air conditioner. Size conditioner for a maximum ambient of 110 deg F. Provide cabinet thermal calculations with shop drawing submittal.

C. PLC cabinet to exclude motor starters, VFDs and any 480V devices.

2.7 SPARES

A. The following spare parts shall be provided:

1. One of each type of PLC controller module

2. One of each type of communications and remote I/O module.

3. One I/O module for each ten of each type installed, with a minimum of 2 per type

4. One spare PLC power supply.

5. One field termination module of each type for every ten installed, with a minimum of 2 per type.

6. One of each type of preformed interconnection cable

2.8 MANAGED INDUSTRIAL ETHERNET SWITCH WITH INTEGRAL FIREWALL.

A. Furnish industrial managed Ethernet switches with firewall as shown on the drawings and complying with the requirements of this Section, to provide network connectivity between network components.

B. The Ethernet switch manufacturer shall be CISCO, Industrial Security Appliance 3000, no exceptions

C. Provide the switch with the following minimum features:

1. Fan-less metal enclosure. DIN rail or rack mounting. Built for harsh environments.

2. Ports: As required. Minimum of two shielded RJ45 10/100 Mbps Ethernet ports with auto negotiation. One Ethernet RJ console port.

3. Support Small Form-factor Pluggable (SFP) transceivers, selectable for copper and single/ multi-mode fiber networks. Provide a minimum of 2 SFP ports.

4. SFP fiber transceivers as shown on the drawings. Coordinate transceiver model with the requirements of the ESL Service Provider.

5. Ethernet /IP support. Port security and access control.

6. Rapid Spanning Tree Protocol, and bandwidth control.

7. Power supply: 120 VAC

8. Minimum operating temperature range: -40 to 70 deg C (-40 to 158 deg F)

D. Provide threat defense/malware application and 5-year update subscription. License in the name of the City of LA

2.9 UNMANAGED INDUSTRIAL FAST ETHERNET SWITCH

A. Furnish industrial unmanaged Ethernet switch as shown on the drawings and complying with the requirements of this Section, to provide network connectivity between network components.

B. The Ethernet switch manufacturer shall be CISCO, Industrial Security Appliance 2000, Red Lion N-Tron series, Allen Bradley, or equal.

C. Provide the switch with the following minimum features:

1. Compact, fan-less metal enclosure. DIN rail mounting. Built for harsh environments.

2. Copper ports: As required. Minimum of four shielded RJ45 10/100 Mbps full duplex Ethernet ports with auto negotiation. One Ethernet RJ console port.

3. Support Small Form-factor Pluggable (SFP) transceivers, selectable for copper and single/ multi-mode fiber networks. Provide a minimum of 2 SFP ports.

4. SFP fiber transceivers as shown on the drawings. Coordinate transceiver model with the requirements of the ESL Service Provider.

5. Ethernet /IP support. Port security and access control.

6. Rapid Spanning Tree Protocol, and bandwidth control.

7. Power supply: 120 VAC

8. Minimum operating temperature range: -40 to 70 deg C (-40 to 158 deg F)

9. DIN rail mounting kit.

2.10 FIBER OPTIC PATCH PANELS

A. All fiber-optic cable terminations shall be made in optical patch panel assemblies. Patch panel assemblies shall be of the pre-assembled chassis type with associated rack or wall mounting hardware.

B. To facilitate the transition between outside plant cable and the pre-connectorized cable assemblies, the fibers shall be fusion spliced and housed in a splice tray. Splice tray shall be positioned in the optical patch panel assembly per manufactures recommendation. Splice attenuation shall not exceed 0.2 db. Splice shall be covered with a protective sleeve. Splice tray to provide fiber storage.

C. Provide one port for each fiber specified. Terminate all spare fibers within the patch panel.

D. Provide protection and strain relief for cables entering the patch panels.

E. Provide fiber-optic patch cords to connect between the fiber-optic panel and fiber-optic network equipment.

F. Provide machine printed port labels, and cable management items to maintain a greater than minimum cable bending radius.

G. Manufacturer shall be: Corning Cable Systems, Panduit, Commscope, or equal.

2.11 FIBER-OPTIC CABLE

A. Single mode fiber cables:

1. Type: Single mode, loose tube, gel-free, indoor/outdoor rated with water blocking layer.

2. Designed for inter-building and intra-building backbones Flame retardant, low smoke, zero halogen.

3. Core/ clad diameter: 8.2/ 125 micron

4. Number of fibers: As shown on the drawings. Minimum of 12.

5. Maximum attenuation: 0.4 dB/km at 1310 nm, 0.3 db at 1550 nm

6. Maximum connector loss: 0.75 db

7. Maximum splice loss: 0.2 db

B. Multimode fiber cables

1. Loose-tube, gel free, indoor/outdoor rated with water blocking layer. Color coded fibers according to TIA/EIA-598.

2. Designed for inter-building and intra-building backbones Flame retardant, low smoke, zero halogen.

3. Core/ Clad diameter: 50/125 micron

4. Number of fibers: As shown on the drawings. Minimum of 12 fibers.

5. Maximum attenuation: 2.5 dB/km at 850 nm, 0.3 db at 1550 nm

6. Maximum connector loss: 0.75 db

7. Maximum splice loss: 0.2 db

C. Connectors: LC/UPC-90° (TIA/EIA-604-10A) polished connectors unless required otherwise by equipment.

2.12 COPPER NETWORK CABLE

A. Category 5E, 6 network cable.

1. Cable: CAT 5E, 6 UTP, rated indoor/outdoor as required by NEC Article 800

2. Jacket: FEP/PVC

3. Conductors: 4 pair, 23 AWG minimum

4. Manufacturer: Belden, Berk-Tek, General Cable or equal.

PART 3 -- EXECUTION

3.1 INSTALLATION

A. Install communications equipment and cables as recommended by the manufacturer and in accordance with TIA-568-C.0/ C.1, C.2, C.3

B. Ensure maximum pulling tensions of communications cables are not exceeded, and cable bends maintain proper radius

C. Prior to installation, physically inspect cable for damage to the jacket as it is taken from the reel. Do not install damaged cable.

D. D. Install equipment and cables as recommended by the Manufacturer and in accordance with TIA-568-C.0/C.1,C.2, C.3.

E. Provide all device configuration required to implement the full functionality of the networks/ communication system. Document the final configuration parameters, IP addresses, and passwords. Include a copy in the submitted Operations and Maintenance Manuals.

F. Category 5E, 6 Ethernet network cable testing.

1. Test Ethernet cables with cable network test set (Fluke LinkIQ or similar) and record results.

2. Measure values and determine pass/fail result for each parameter. Include:
   a. Continuity and attenuation
   b. Shorts between conductors
   c. Crossed and reversed pairs
   d. Cable length
   e. Bandwidth.

3.2 TESTING - GENERAL

A. All control panels and other control system equipment shall be factory tested to verify all functions and features of the equipment; both the manufacturer's published specifications and compliance with all requirements of these Contract Specifications.

B. The ENGINEER may witness testing of the units.

C. Solid-state logic systems shall be tested as complete assemblies. Testing of individual components or modules will not be acceptable. All testing shall be witnessed by the representative of the City Engineer. All costs for travel, lodging, transportation, meals, per-diem and other related expense shall be paid by the Contractor as part of the Contract Bid price. See General Requirements, Section 01453: Sampling, Testing and Fabrication Inspection..

D. Seven Day Acceptance Test:

1. After startup has been completed, the System shall undergo a seven (7) day acceptance test. The System must run continuously for seven (7) consecutive days. During this period, all System functions shall be exercised, and any System interruption and accompanying component, subsystem, or program failure shall be logged for cause of failure, as well as time of occurrence and duration of each failure. A failure shall cause termination of the seven (7) day acceptance test. When the cause of a failure has been corrected, a new seven (7) day acceptance test shall be started. Skilled technicians shall respond to all trouble calls by the CITY.

2. The technician responding to a System malfunction, must prepare a report which includes details concerning the nature of the complaint or malfunction and the resulting repair action required and taken, plus time and date of occurrence and correction.

3. The System Malfunction Report form shall be submitted to the ENGINEER for review and approval before the time of re-start of testing. Failure to obtain ENGINEER approval for the Report form shall cause postponement of testing.

3.3 FIBER-OPTIC CABLE TESTING

A. Provide 100% attenuation testing of all cable fibers while on the reel and prior to installation. Document results including cable manufacturer, date of manufacture, shipping date, cable identification, length and fiber identification. Submit results for approval prior to installation

B. Install communications equipment and cables as recommended by the manufacturer and in accordance with TIA-568-C.0/ C.1, C.2, C.3

C. Ensure maximum pulling tensions of communications cables are not exceeded, and cable bends maintain proper radius..

D. Visual inspection for continuity. Connector and loss testing after installation.

1. Fiber Connector Inspection: Use a fiber optics microscope to check the quality of the termination. A well-made connector is smooth, polished, scratch free with no signs of cracks, chips or areas where the fiber is either protruding from the end of the ferrule or pulling back into it. Remake poor connections.

E. After cable installation use a power meter per EIA/TIA 455-78-B and OTDR per ANSI/TIA/EIA-455-8-2000 to perform bi-directional cable testing of each fiber/ connector system from end to end. Match the source type and wavelength (850, 1300, 1550 nm). Calculate the loss using the average of the two bi-directional measurements.

F. Fiber acceptance power loss for cable, connectors and splices:

1. For each mated connector pair, a maximum of 0.7 dB. Typical 0.5 dB.

2. For each splice a maximum of 0.2 dB

3. For fiber: Attenuation as specified by the manufacturer.

4. Maximum allowable link loss:

   Maximum loss = (0.7dB X # of mated pairs of connectors) +(0.2 dB X #of splices) +fiber loss of total length of cable

G. If the measured loss is greater than the allowable maximum loss, take necessary measures to bring the link loss into compliance.

1 INTRODUCTION

In accordance with your request and authorization, we have performed a geotechnical evaluation at Strathern Park North located at 8041 Whitsett Avenue in North Hollywood, California as part of the Los Angeles Bureau of Engineering (LABOE) Stormwater Capture Parks Program (Figure 1 [all figures are located at the end of the text of this report]). The purpose of our study was to evaluate the soil and geologic conditions at the site and to provide geotechnical recommendations for pre-design of proposed Best Management Practices (BMPs) at the site for stormwater infiltration. Our evaluation was performed in general accordance with Task Order Solicitation (TOS) No. 25 (LABOE, 2019a) and our referenced proposal dated May 18, 2020 (Ninyo & Moore, 2020a). This report presents our findings, conclusions, and recommendations for the Strathern Park North project. Concurrent with the subject geotechnical evaluation, we also performed a Limited Phase II Environmental Site Assessment (ESA) for the project in general accordance with Addendum No. 5 of TOS No. 25 (LABOE, 2019b). The results of our ESA are presented under separate cover (Ninyo & Moore, 2020b).

The intent of the Stormwater Capture Parks Program is to capture up to 2,912 acre-feet of stormwater and urban runoff per year that drain from 5,868 acres within a portion of the San Fernando Valley in order to reduce the potential for flooding, improve stormwater quality, increase water supplies through stormwater capture, and provide recreational, social, and economic benefits (LABOE, 2019a). The stormwater runoff will be diverted into proposed stormwater capture and infiltration BMPs within nine City of Los Angeles parks generally located along the SR-170 corridor, including the subject Strathern Park North, for replenishment of the San Fernando Groundwater Basin. According to the Conceptual Study Report (CSR) (Los Angeles Department of Water & Power [LADWP], 2018), the project at Strathern Park North is anticipated to capture and infiltrate stormwater runoff from a tributary area of approximately 485 acres.

2 SCOPE OF SERVICES

Our scope of geotechnical services was prepared based on our review and the conceptual design provided in the CSR (LADWP, 2018) and discussions with the client, CDM Smith, and included the following:

- Project coordination and planning with subcontractors and client, LABOE, and Los Angeles Department of Recreations and Parks (RAP) personnel, and attendance at a project kick-off meeting.
- Review of readily available background materials, including published topographic maps, geologic maps, fault and seismic hazard maps, groundwater data, stereoscopic aerial photographs, project related plans, and in-house geotechnical information.
- Acquisition of a Los Angeles County Environmental Health Department (LACEHD) permit.

- Field reconnaissance to observe and document the site conditions, mark-out proposed hollow-stem-auger (HSA) boring, test pit, and cone penetration test (CPT) sounding locations for underground utility clearance by Underground Service Alert, and meet with RAP personnel regarding site access and constraints.

- Performance of a geophysical survey to clear our proposed boring, CPT, and test pit locations of potential underground utility conflicts.

- Subsurface exploration consisting of the drilling, sampling, and logging of nine HSA borings to depths s ranging from approximately 17½ to 70½ feet, and six CPT soundings depths ranging from approximately 48.1 to 50.3 feet. The purpose of the borings and CPT soundings was to evaluate the subsurface soil conditions and percolation rates of the on-site soils.

- Performance of six test pits to depths ranging from approximately 8½ to 10 feet to evaluate the near-surface soil conditions and the potential depths and/or limits of reported landfill debris.

- Field percolation testing in six of the borings in general accordance with the methods presented in the County of Los Angeles Guidelines for Geotechnical Investigation and Reporting Low Impact Development Stormwater Infiltration (COLA, 2017).

- Geotechnical laboratory testing of representative soil samples to evaluate in-situ moisture content and dry density, gradation, percentage of particles finer than the No. 200 sieve, Atterberg limits, consolidation, direct shear strength, and soil corrosivity.

- Data compilation and engineering analysis of the information obtained from our background review, subsurface evaluation, infiltration testing, and laboratory testing.

- Preparation of this geotechnical report presenting our findings, conclusions, and preliminary recommendations pertaining to the design and construction of the proposed improvements.

3 SITE DESCRIPTION AND BACKGROUND

Strathern Park North is a City of Los Angeles park located on the eastern side of the San Fernando Valley, east of California State Route (SR) 170 and approximately 1mile south of Interstate 5 (I-5) (Figure 1). The park consists of a relatively flat, triangular-shaped lot bounded by a LADWP transmission line (TL) easement on the southwest, residential homes on the north, Whitsett Avenue on the east, Strathern Street on the south. (Figures 2 and 3). The east approximate half of the park is developed with four baseball fields, restroom and concession facilities an asphalt concrete (AC) parking lot, Portland cement concrete (PCC) walkways, landscaping, and other miscellaneous improvements. The west approximate half of the park is undeveloped (Figures 2 and 3). Based on our review of the CSR (LADWP, 2018), we understand that an existing 45-inch-diameter reinforced concrete pipe (RCP) storm drain is located along the east side of SR-170 and a 60-inch-diameter water pipeline traverses the LADWP TL easement. Based on our review of topographic maps (NavigateLA, 2020), the park slopes gently downward toward the southeast with site elevations ranging from approximately 808 feet above mean sea level (MSL) at the northwest corner of the park to approximately 800 feet (MSL) at the southeast corner.

Based on our discussion with CDM Smith, we understand that the City indicated that the park grounds may have formerly been used as a waste disposal site associated with past construction activities in the area. Based on our limited review of historical photographs, it does appear that the site was used for waste disposal in at least the early 1950's (Historical Aerials, 2020). Our review of 1952 aerial photographs indicate that the project site contained several unpaved roads that extended west from Whitsett Avenue and terminated at a round, raised area within the area of the baseball fields and the eastern portion of the undeveloped area west of the fields. Aerial photographs from 1953 indicate that additional surface disturbance occurred within these areas of the park and included a second similar raised area. The raised areas observed in each photograph are interpreted to be stockpiles of unknown material. In addition, the residences along the north side of the park were not present in the 1952 photographs; however, some of the residences had been constructed by 1953. Based on our review these photographs, the raised stockpiles and surface disturbances may have been related to waste disposal associated with residential construction projects in the area. The aerial photographs also suggest that the waste disposal may extend offsite, underlying some adjacent residences north of the park. Further discussion regarding our findings and aerial photograph review are presented in our separate ESA report (Ninyo & Moore, 2020b).

4 PROJECT DESCRIPTION AND PROPOSED CONSTRUCTION

Based on our review of TOS 25 (LABOE, 2019a), the project generally consists of the installation of new BMPs within the undeveloped western approximate half of Strathern Park North to infiltrate storm water diverted from the existing 45-inch-diameter RCP storm drain along SR-170 (Figure 4). The new BMPs would consist of the installation of an underground infiltration gallery, a catch basin, diversion structure, pump station, hydrodynamic separator (HDS) units, flow measuring devices, supervisory control and data acquisition (SCADA), educational signage, and park restoration/improvements. According to the CSR (LADWP, 2018), the conceptual infiltration gallery would be sized to store approximately 968,000 cubic feet of water and include a footprint of approximately 97,700 square feet (sf), an inner height of approximately 12 feet, and an invert depth of approximately 17 feet below the ground surface. We understand that the gallery will likely consist of prefabricated, modular concrete vaults with open bottoms underlain by drain rock over a layer of filter fabric. Based on our discussions with CDM Smith, it is our understanding that the gallery may be supported on concrete strip footings. Upon completion of the BMP installation, the BMPs will be buried with compacted fill and the ground surface returned to its existing condition for continued use and additional development as a park.

Subsequent to performing our subsurface exploration, presented herein, we received conceptual plans from our client (CDM Smith, 2020), which include four BMP options (Alternatives 1

through 4) for the project. The improvements associated with Alternatives 1 through 3 will generally be constructed within the undeveloped portion of the park (west of the baseball fields). Alternative 4 provides an option to build beneath the baseball fields. We understand that these proposed alternatives are subject to change as further design is performed. The four options are described below.

Alternative 1 – According to CDM Smith (2020), Alternative 1 consists of the installation of a subterranean infiltration gallery (73,000 sf) with an interior height of 14 feet and invert depth of approximately 18 feet, a diversion structure on the existing 45-inch-diameter RCP storm drain and a catch basin at the southern end of Potter Avenue. New 36 and 42-inch-diameter pipelines would be installed between the diversion structure and gallery with an in-line HDS unit and pump station. The catch basin will be connected to the gallery via an additional pipeline. The proposed layout of Alternative 1 is presented on Figure 3.

Alternative 2 – Alternative 2 is similar to Alternative 1 except that the diversion structure and pump station would be moved farther away from the transmission towers.

Alternative 3 – Alternative 3 consists of a smaller subterranean infiltration gallery (72,000 sf) with an interior height of 12 feet and invert depth of approximately 19½ feet. This alternative would also include the use of 12 approximately 50-foot-deep dry wells connected to the gallery. The pump station would be removed and the catch basin at the south end of Potter Avenue would drain into a bioswale along the north boundary of the park.

Alternative 4 – Alternative 4 consists of a subterranean infiltration gallery (73,000 sf) with an interior height of 14 feet and invert depth of approximately 18 feet beneath the existing baseball diamonds on the eastern portion of the park. This alternative also includes the installation of two approximately 50-foot-deep dry wells for dry weather runoff, a diversion structure on the existing 45-inch-diameter RCP storm drain and new 36 and 42-inch-diameter pipelines with an in-line HDS unit and pump station. Additional subsurface exploration would be necessary to further evaluate Alternative 4, if chosen for the project.

5 SUBSURFACE EVALUATION AND LABORATORY TESTING

Our subsurface evaluation was conducted on March 23 through 26, 2020, and consisted of the drilling, logging, and sampling of nine HSA borings (B-1, B-2, and B-3 and P-1 through P-6), six test pits (TP-1 through TP-6), and six CPT soundings (CPT-1 through CPT-6). The approximate locations of the borings, test pits, and CPTs are presented on Figure 4. The borings were drilled using a truck-mounted drill rig with 8-inch diameter augers to depths ranging from approximately 17½ to 70½ feet. The depths of the borings were based on the conceptual design depths for the

infiltration basin presented in the CSR (LADWP, 2018) and on our discussions with CDM Smith regarding the possible use of deeper dry wells. The test pits were excavated using a John Deere 310 SG backhoe to depths ranging from 8½ to 10 feet to evaluate the near-surface soil conditions and to evaluate the potential depths and/or limits of reported landfill debris. The borings and test pits were logged in the field by a representative of Ninyo & Moore and representative bulk and relatively undisturbed soil samples were collected from the borings at selected depths for laboratory testing. Percolation testing was performed in borings P-1 through P-6 as further discussed in Section 8 of this report. The CPT soundings (CPT-1 through CPT-6) were performed using a 30-ton CPT rig with a 15 square centimeter cone to depths ranging from approximately 48.1 to 50.3 feet, respectively. Refusal was encountered in CPT-6 at a depth of approximately 48.1 feet. Continuous soil profiles, including cone tip resistance and sleeve friction, were recorded during the soundings. A representative of Ninyo & Moore was on-site to observe the CPT soundings. The borings and CPTs were backfilled with cement-bentonite grout upon completion of the drilling and percolation testing in general accordance with the requirements of LACEHD. The test pits were backfilled with the excavated materials upon completion. Logs of the exploratory borings, test pits, and CPTs are provided in Appendices A, B, and C, respectively.

Geotechnical laboratory testing of representative soil samples included tests to evaluate in-situ moisture content and dry density, gradation, percentage of particles finer than the No. 200 sieve Atterberg limits, consolidation, direct shear strength, and soil corrosivity. Moisture and density test results are presented on the boring logs in Appendix A. The remaining test results are presented in Appendix D.

During our subsurface exploration, samples were collected from borings B-1, B-3, P-2, P-4, and P-6 for analytical testing in general accordance with Addendum 5 of TOS 25 (LABOE, 2019b). During drilling of these borings, soil gas was measured. The measured readings are provided on the boring logs presented in Appendix A. Further discussion regarding the soil gas readings and analytical sampling and testing are provided in our separate ESA report (Ninyo & Moore, 2020b).

Soil cuttings from the borings and CPTs were placed in 55-gallon drums, and two composite soil samples of the drummed soil were collected in an 8-ounce jar for waste characterization. The samples were stored in a chilled cooler and delivered to SunStar Laboratories, Inc. for analytical testing under chain-of-custody protocol. The samples were tested for total petroleum hydrocarbons (TPH) (gas and diesel range) per United Stated Environmental Protection Agency (EPA) Test Method 8015B, Title 22 metals per EPA Test Methods 6010B/7470/7471, and volatile organic compounds per EPA Test Method 8260B. Based on the characterization test results, the drums were disposed at an approved landfill (Soil Safe in Adelanto, California) by a licensed

transportation subcontractor (Belshire) as nonhazardous. The test results and a copy of the transportation manifest are provided in Appendix E.

6 GEOLOGIC AND SUBSURFACE CONDITIONS

The project site is within the San Fernando Valley, which is generally bounded by the Santa Monica Mountains on the south, Verdugo Mountains on the east, Santa Susana Mountains on the north, and Chatsworth Hills on the west. The valley along with these bounding mountain ranges are part of the Transverse Ranges Geomorphic Province. The province encompasses an approximately 40- to 60-mile-wide area (north to south) that extends approximately 320 miles (west to east) from Point Arguello and San Miguel Island to the Eagle and Pinto Mountains of the Mojave Desert (Norris and Webb, 1990). The province generally consists of a region of east to west-trending mountain ranges considered atypical to the predominant northwest to southeast structural fabric of California. The atypical trend of the Province is the result of a restraining bend ("the Big Bend") on the San Andreas Fault that has rotated and compressed the region to its current configuration. The compression has resulted in folding and reverse/thrust faulting with similar east to west trends, and regional uplift. The Santa Monica Mountains are the southernmost of the east to west trending ranges of the province and the San Fernando Valley is a synclinal valley infilled with relatively thick deposits of sedimentary rock overlain by alluvial deposits (Norris and Webb, 1980).

Review of regional geologic maps indicate that the site is generally underlain by Holocene-age wash deposits associated with deposition along the Tujunga Wash (Campbell et al., 2014) (Figure 5). The deposits are described as consisting of unconsolidated gravel, sand, and silt in active or recently active stream beds. The California Department of Mines and Geology (CDMG, 1997) has also mapped the site as being underlain by wash deposits consisting of loose to medium dense, sand, and silty sand with lesser quantities of silt and gravel.

During our subsurface evaluation, we encountered undocumented fill underlain by alluvium. Generalized descriptions of the materials encountered during our subsurface exploration are presented below. More detailed descriptions of the subsurface materials are presented on the boring, test pit, and CPT logs in Appendices A through C, respectively.

6.1 Undocumented Fill

Undocumented fill was encountered in the borings and test pits to depths ranging from approximately 3 to 13 feet below the ground surface. The fill generally consisted of granular deposits of light brown and brown, moist, very loose to medium dense, silty sand, clayey sand, poorly graded sand with silt, poorly graded sand with clay, poorly graded sand, well-graded sand

with silt, and sandy silt, and brown, moist, soft to firm, lean clay. The fill contained various amounts of gravel and scattered cobbles. Minor amounts of waste were observed within the undocumented fill at borings B-1, B-2, P-1, P-3, and P-5, and test pits TP-3 through TP-6. The observed waste generally consisted of pieces of AC, concrete, glass, bricks, and ceramic, plastic, glass bottles, and tires. Documentation regarding the limits of fill or the placement and compaction of the fill soils was not available for our review.

6.2 Alluvium

Alluvium was encountered beneath the undocumented fill, to the total depth explored of up to approximately 70½ feet. The alluvium generally consisted of interbedded granular deposits of light brown and brown, moist, loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, and sandy silt. The alluvial deposits contain variable amounts of gravel and cobbles.

7 GROUNDWATER

Seepage and/or groundwater was not encountered in our borings or CPTs to the total depths explored of up to approximately 70½ feet. CDMG (1997) indicates that the historic high depth to groundwater at the project site ranges between approximately 110 to 120 feet below the ground surface. Groundwater monitoring well data (Wayne Perry, Inc., 2012) available on the State of California Water Resources Control Board's GeoTracker website (SWRCB, 2020) indicates that the depth to groundwater in 2012 was on the order of 194 feet below the ground surface at a former gas station site located approximately 2,800 feet northwest of the park. The depth to groundwater in a Los Angeles County groundwater monitoring well (Well ID 4898) located 800 feet southeast of the site was approximately 307 feet in 2009 (the latest posted measurement) (COLA, 2020). The depth to groundwater in this well ranged from approximately 204 and 335 feet between 1975 and 2009. It is anticipated that similar depths to groundwater are present at the park site. Fluctuations in the level of groundwater will occur due to variations in ground surface topography, subsurface stratification, rainfall, irrigation practices, groundwater pumping, and other factors that were not evident at the time of our field evaluation.

8 FIELD PERCOLATION TESTING

Percolation testing was performed in borings P-1 through P-6 in general accordance with the County of Los Angeles Guidelines for Geotechnical Investigation and Reporting Low Impact Development Stormwater Infiltration (COLA, 2017). The testing was performed to evaluate the infiltration rate of the on-site soils at the approximate depths of the proposed infiltration gallery (17 feet per the CSR [LABOE, 2018]) and dry wells (approximately 50 feet per CDM Smith) for

use in design of the BMPs by CDM Smith. The approximate locations of the percolation test borings are shown on Figure 4.

Borings P-1 through P-6 were drilled to depths ranging from 17½ to 51½ feet. Preparation of each boring for percolation testing included the installation of a 2-inch-diameter polyvinyl chloride (PVC) pipe in the borings, the lowest 15 feet of which was slotted, and backfilling the bottom approximately 15 feet of annular space between the borehole wall and pipe with clean gravel. The infiltration zones were pre-soaked with water for at least one hour prior to performing percolation testing. After the borings were pre-soaked, constant-head percolation testing was performed in each boring.

The constant-head testing was performed by placing clean water in the PVC pipe at a constant flow rate to establish a stabilized head. The flow rate was measured using a digital flow meter. Once a stabilized head was established in the borings, the constant-head test was initiated and the flow was maintained for a period of approximately 2 hours. The field percolation rate was calculated by measuring the total volume of water infiltrated during the total duration of the test and dividing by the surface area of the tested zone of the boring. The measured field percolation rates are presented in Table 1.

The County of Los Angeles guidelines (COLA, 2017) indicate that the measured field percolation rates should be reduced in order to account for the long-term performance of the proposed BMPs. The field percolation rates should be reduced by the Total Reduction Factor (RF), which is defined as the product of the "test-specific" reduction factor (RF_t), the "site variability" reduction factor (RF_v), and the "long-term siltation, plugging, and maintenance" reduction factor (RF_s) (i.e., $RF = RF_t \times RF_v \times RF_s$).

The guidelines (COLA, 2017) indicate that the RF_t should be applied to account for variations in the direction of flow during the test and the reliability of the different test methods. An RF_t value of 3 is specified for the constant head percolation test and this value was applied to the field percolation rates. The RF_v values range from 1 to 3 depending on the site variability, number of tests, and thoroughness of subsurface investigation. For the subject park, we applied an RF_v value of 1.9 due to the variability of the on-site soils and field percolations rates. The long-term siltation, plugging, and maintenance values (RF_s) also range from 1 to 3 and will generally vary on the level of pre-treatment performed prior to infiltration and the level of future maintenance of the system. Based on our discussions with the BMP designers, an RF_s value of 1 has been applied since pre-treatment systems will be used to remove silt prior to water entering the infiltration gallery/deep wells. The RF_s value and resulting RF should be adjusted by the BMP designer as needed. The RF_t, RF_v, RF_s, and resulting RF values are presented in Table 1. The

adjusted percolation rates are also presented in Table 1. The average of the adjusted rates is considered to be the Design Percolation Rate.

Table 1 – Percolation Test Results

Test Boring	Test Type	Approximate Depth of Tested Zone (feet)	Field Percolation Rate (inches/hour)	Reduction Factor				Adjusted Percolation Rate (inches/hour)
				RF_t	RF_v	RF_s	RF	
P-1	Constant Head	7 – 17½	16.5	3	1.9	1	5.7	2.9
P-2	Constant Head	41 – 51½	11.5	3	1.9	1	5.7	2.0
P-3	Constant Head	7 – 17½	28.5	3	1.9	1	5.7	5.0
P-4	Constant Head	41 – 51½	11.2	3	1.9	1	5.7	2.0
P-5	Constant Head	7½ – 17½	41.5	3	1.9	1	5.7	7.3
P-6	Constant Head	41 – 51½	29.1	3	1.9	1	5.7	5.1
Average Adjusted Percolation Rate (inches/hour)								4

Notes:
RF_t – Test Specific Reduction Factor
RF_v – Site Variability Reduction Factor
RF_s – Long-Term Siltation, Plugging, and Maintenance Reduction Factor (To be adjusted by the BMP designer)
RF – Total Reduction Factor

Based on our evaluation, we recommend that the average adjusted percolation rate of 4 inches per hour, following additional adjustment by the BMP designer to account for RFs, be used for design at Strathern Park North for both shallow and deep infiltration.

In addition, we recommend the new or existing buildings be set-back from the proposed infiltration gallery a minimum of 15 feet or a distance where the bottom of the lowest foundation element of the structure is 10 feet or more (horizontally) outside of an imaginary 1:1 (horizontal:vertical) plane projected downward and outward from the top of the gallery. Where basement levels are proposed that extend beneath the top of the infiltration gallery elevation, additional evaluation should be performed to confirm the appropriate set-back.

9 FLOOD HAZARDS

Based on our review of flood insurance rate maps for the project area (Federal Emergency Management Agency [FEMA], 2020), the project site is not located in the 100-year Flood Hazard Zone, A99. Zone A99 includes areas to be protected from a 100-year flood by the Federal Flood Protection System under construction at the time of publication of the FEMA map; no base flood elevations are given. The site is located within Other Flood Areas – Zone X, which includes areas of 500-year floods and areas of 100-year floods with average depths of less than one foot and areas protected by levees from 100-year floods.

10 FAULTING AND SEISMICITY

The site is in a seismically active area, as is the majority of southern California, and the potential for strong ground motion in the project area is considered significant during the design life of the proposed project. Figure 6 shows the approximate site location relative to the major known faults in the region. The site is not located within a State of California EFZ (formerly known as an Alquist-Priolo Special Studies Zone) (Hart and Bryant, 2018). The nearest mapped active fault to the site is the Verdugo fault located approximately 1.9 miles (3.1 kilometers) northeast of the site (United States Geological Survey [USGS], 2008).

The principal seismic hazards evaluated at the subject site are surface fault rupture, ground motion, and liquefaction. A brief description of these principal seismic hazards is discussed in the following sections.

10.1 Surface Fault Rupture

Surface fault rupture is the offset or rupturing of the ground surface by relative displacement across a fault during an earthquake. Based on our review of referenced geologic and fault hazard data, the project site is not transected by known active faults. Therefore, the potential for surface rupture is relatively low. However, lurching or cracking of the ground surface as a result of nearby seismic events is possible.

10.2 Site-Specific Ground Motion

Considering the proximity of the site to active faults capable of producing a M_{max} of 6.0 or more, the project area has a high potential for experiencing strong ground motion. The 2019 CBC specifies that the risk-targeted maximum considered earthquake (MCE_R) ground motion response accelerations be used to evaluate seismic loads for design of buildings and other structures.

In accordance with Chapter 20 of the American Society of Civil Engineers (ASCE) Publication 7-16 Minimum Design Loads and Associated Criteria for Building and Other Structures (2016), the Site Class should be classified based on the average shear wave velocity (V_S) in the upper 100 feet (i.e., 30 meters) (V_{S30}), the average field standard penetration resistance in the upper 100 feet (blow counts, N), or the average undrained shear strength in the upper 100 feet (S_u). After reviewing the blow counts obtained from our borings and correlations from our CPTs, the field penetration blow counts in the upper 100 feet are within the range of 15 to 50 blows per foot. Additionally, we estimated that the V_{S30} at the site is 918 feet per second (ft/s) (i.e., 280 meters per second (m/s) (CGS/Willis Site Classification Map) using the Open Seismic Hazard Analysis software developed by USGS (USGS, 2019). ASCE 7-16 defines a site as Site Class D (stiff soil)

if the V_{S30} ranges from 600 to 1,200 ft/s (180 to 370 m/s) and if the blow counts in the upper 100 feet range from 15 to 50 blows per foot. Accordingly, the site is classified as Site Class D.

Per the 2019 CBC, a site-specific ground motion hazard analysis shall be performed for structures on Site Class D with a mapped MCE_R, 5 percent damped, spectral response acceleration parameter at a period of 1 second (S_1) greater than or equal to 0.2g in accordance with Sections 21.2 and 21.3 of ASCE 7-16. We calculated that the S_1 for the site is equal to 0.658g using the 2020 Applied Technology Council [ATC] seismic design tool (web-based)]; therefore, a site-specific ground motion hazard analysis was performed for the project area.

The site-specific ground motion hazard analysis consisted of the review of available seismologic information for nearby faults and performance of probabilistic seismic hazard analysis (PSHA) and deterministic seismic hazard analysis (DSHA) to develop acceleration response spectrum (ARS) curves corresponding to the MCE_R for 5 percent damping. Prior to the site-specific ground motion hazard analysis, we obtained the mapped seismic ground motion values and developed the general MCE_R response spectrum for 5 percent damping in accordance with Section 11.4 of ASCE 7-16 (ATC, 2020). The V_{S30} is assumed to be 918 ft/s (i.e., 280 m/s) (CGS/Willis Site Classification Map) and the depths to V_S = 3,281 ft/s (i.e., 1,000 m/s) and V_S = 8,202 ft/s (i.e., 2,500 m/s) are assumed to be 1,148 feet (i.e., 350 meters) and 6,627 feet (i.e., 2,020 meters), respectively (Southern California Earthquake Center [SCEC] Velocity Model Version 4, Iteration 26, Basin Depth). These values were evaluated using the Open Seismic Hazard Analysis software developed by USGS (USGS, 2019).

The 2014 next generation attenuation (NGA) West-2 relationships were used to evaluate the site-specific ground motions. The NGA relationships that we used for developing the probabilistic and deterministic response spectra are by Chiou and Youngs (2014), Campbell and Bozorgnia (2014), Boore, Stewart, Seyhan, and Atkinson (2014), and Abrahamson, Silva, and Kamai (2014). The Open Seismic Hazard Analysis software developed by USGS (USGS, 2019) was used for performing the PSHA. The Calculation of Weighted Average 2014 NGA Models spreadsheet by the Pacific Earthquake Engineering Research Center was used for performing the DSHA (Seyhan, 2014).

PSHA was performed for earthquake hazards having a 2 percent chance of being exceeded in 50 years multiplied by the risk coefficients per ASCE 7-16. The maximum rotated components of ground motions were considered in PSHA with 5 percent damping. For the DSHA, we analyzed accelerations from characteristic earthquakes on active faults within the region using the California Department of Transportation (Caltrans) ARS (Caltrans, 2020) seismic design tool (web-based) and the hazard curves and deaggregation plots at the site using the USGS Unified

Hazard Tool application (USGS, 2020a). A magnitude 7.5 event on the Verdugo fault with a distance of 1.9 miles (i.e., 3.1 kilometers) from the site is the controlling earthquake. Hence, the DSHA was performed for the site using this event and corrections were made to the spectral accelerations for the 84th percentile of the maximum rotated component of ground motion with 5 percent damping. The results of our site-specific seismic hazard analysis are presented in Appendix F.

The site-specific MCE_R response spectrum was taken as the lesser of the spectral response acceleration at any period from the PSHA and DSHA, and the site-specific general response spectrum was determined by taking two-thirds of the MCE_R response spectrum with some conditions in accordance with Section 21.3 of ASCE 7-16. Figure 7 presents the site-specific MCE_R response spectrum and the site-specific design response spectrum. The general mapped design response spectrum calculated in accordance with Section 11.4 of ASCE 7-16 is also presented on Figure 7 for comparison. The site-specific spectral response acceleration parameters, consistent with the 2019 CBC, are provided in Section 12.4 of this report for the evaluation of seismic loads on buildings and other structures. The site-specific maximum considered earthquake geometric mean (MCE_G) peak ground acceleration, PGA_M, was calculated as 0.834g.

10.3 Liquefaction

Liquefaction is the phenomenon in which loosely deposited granular soils with silt and clay contents of less than approximately 35 percent and non-plastic silts located below the water table undergo rapid loss of shear strength when subjected to strong earthquake-induced ground shaking. Ground shaking of sufficient duration results in the loss of grain-to-grain contact due to a rapid rise in pore water pressure and causes the soil to behave as a fluid for a short period of time. Liquefaction is known generally to occur in saturated or near saturated cohesionless soils at depths shallower than 50 feet below the ground surface. Factors known to influence liquefaction potential include composition and thickness of soil layers, grain size, relative density, groundwater level, degree of saturation, and both intensity and duration of ground shaking.

The State of California Hazard Zones map (CDMG, 1998) indicates that the subject site is located within a mapped area that is not considered susceptible to seismically induced liquefaction (Figure 8). Based on the historic high groundwater depth of approximately 110 to 120 feet below the ground surface and the presence of dense sands with scattered gravel, it is our opinion that liquefaction and liquefaction-related seismic hazards (e.g., dynamic settlement, ground subsidence, and/or lateral spreading) are not design considerations for the project.

11 CONCLUSIONS

Based on the results of our evaluation, it is our opinion that the proposed BMPs at Strathern Park North are feasible from a geotechnical standpoint, provided the recommendations presented in this report are incorporated into the design and construction of the project. In general, the following conclusions were made:

- The subject site is underlain by up to approximately 13 feet of undocumented fill underlain by granular alluvial materials. The fill and alluvium generally consisting of moist, very loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, clayey sand, and sandy silt. Variable amounts of gravel and cobbles were encountered in the fill and alluvium. Various amounts of waste consisting of pieces of asphalt concrete, concrete, brick, glass, ceramic, plastic, and tires were encountered in some of the fill. The fill and waste are considered to be potentially compressible.

- Based on our review of aerial photographs, discussions with the client, and subsurface exploration, portions of the site are underlain by waste placed at the site during at least the 1950's. The lateral extents of the waste are unknown.

- Our six percolation tests performed in borings P-1 through P-6 indicate that the on-site soils tested at depths ranging from approximately 17½ to 50½ feet have percolation rates ranging from approximately 3.7 to 13.8 inches per hour. For design purposes, we recommend using a percolation rate of 4 inches per hour for both shallow (gallery) and deep (dry well) infiltration systems. However, this rate should be adjusted as needed in accordance with COLA 2017 guidelines.

- In general, excavations and drilling in the existing undocumented fill, waste, and alluvium should be feasible with earthmoving equipment in good working condition. However, difficult excavating and drilling conditions should be anticipated by the contractor where excavations and drilling encounter cobbles or waste. Oversized materials should be anticipated in the undocumented fill, waste, and alluvium by the contractor.

- Due to the presence of waste at the site, project planning should include considerations for encountering these materials during construction, including preparation of a Soil Management Plan for use by site personnel, vapor monitoring, selective stockpiling, and characterization and disposal of the waste and impacted soil. Additional recommendations may apply based on further Phase II site assessment work planned for the site.

- We anticipate that the on-site excavated materials outside the lateral extents and/or below the depths of the on-site waste, should be suitable for re-use as engineered fill and trench backfill provided they are free of waste, debris, roots, contamination, deleterious materials, and cobbles or hard lumps of material in excess of 4 inches in diameter. Processing of the materials to bring them near the laboratory optimum moisture content per ASTM International (ASTM) test method D 1557 (i.e., drying and/or wetting) prior to use as fill should be planned by the contractor.

- The on-site soils are generally granular and will be prone to caving during excavation and drilling. The on-site soils should be considered as Type C soils in accordance with United States Department of Labor Occupational Safety Health Administration (OSHA) regulations. Accordingly, temporary excavations deeper than 4 feet in depth should be laid back at inclinations of 1½ to 1 (horizontal to vertical) or flatter.

- Where excavations cannot be laid back, temporary shoring is anticipated. Shoring should be designed by the contractor to support the excavation sidewalls and to reduce the potential

for settlement of adjacent structures, roadways, and other site improvements. Shoring should be designed in accordance with OSHA regulations.

- Groundwater was not encountered in our exploratory borings, test pits, and CPTs to the total depth explored of approximately 70½ feet. Historical high groundwater levels range from approximately 110 and 120 feet below the ground surface. Monitoring wells located approximately 800 feet southeast and 2,800 feet northwest of the site indicate that the depth to groundwater is on the order of 194 to 307 feet (Wayne Perry, Inc., 2012 and COLA, 2020). Fluctuations in the level of groundwater will occur due to variations in ground surface topography, subsurface stratification, rainfall, irrigation practices, groundwater pumping, and other factors that were not evident at the time of our field evaluation.

- The site is not located within a mapped Seismic Hazards Zone considered susceptible to liquefaction (CDMG, 1998).

- The site is not located within an Earthquake Fault Zone with the potential for fault rupture as defined by the Alquist-Priolo Earthquake Fault Zoning Act (Hart and Bryant, 2018).

- Hydro-collapse is not considered a design issue given the proposed depth of the infiltration gallery and dry wells (approximately 18 to 20 feet and 50 feet, respectively [CDM Smith, 2020])) and the results of our laboratory testing.

- The site is not located within a designated flood inundation zone from failure of a dam or the 100-year and 500-year flood events (FEMA, 2020).

- Based on our laboratory corrosion testing, the on-site soil can be classified as non-corrosive based on the Caltrans Corrosion Guidelines (Caltrans, 2018).

12 PRELIMINARY RECOMMENDATIONS

The following sections present our preliminary geotechnical recommendations for design and construction of the project. This project is in preliminary design phase and some aspects of the design will be subject to change. Detailed plans regarding the design of the BMPs have not been developed yet. Accordingly, the following recommendations should be considered preliminary. Ninyo & Moore should review the final plans and develop additional geotechnical recommendations as appropriate. These recommendations are based on our evaluation of the site geotechnical conditions, our understanding of the planned construction, and experience in the vicinity of the project. The work should be performed in conformance with the recommendations presented in this report, project specifications, and appropriate agency standards. The recommendations presented in our Limited Phase II ESA, which will be submitted under separate cover, should also be incorporated into the design and construction of the project.

12.1 Waste

As previously discussed, waste was encountered during our geotechnical evaluation to depths of up to approximately 13 feet and should be anticipated to be encountered during site earthwork. Additional information regarding the waste encountered is provided in our ESA report (Ninyo & Moore, 2020b). From a geotechnical standpoint, the waste should be removed from beneath

proposed improvements and disposed of offsite. Generally, it is anticipated that proposed excavations will remove the waste and expose alluvial deposits. However, removal, handling, and disposal of the waste should also be performed in accordance with mitigation recommendations based on environmental considerations for the project. We understand that additional Phase II environmental site assessment, including subsurface exploration and analytical testing, is being planned to further evaluate the waste types, depths and lateral extents, and potential site impacts in order to provide mitigation recommendations for the project, including implementation of a Soil Management Plan for encountering the waste and impacted soil, including soil handling, vapor monitoring, air-monitoring, selective stockpiling.

12.2 Earthwork

We anticipate that earthwork at the site will consist of cuts and fills associated with excavations to install the proposed BMP improvements, including the gallery, diversion structure, pump station, HDSs, pipelines, manholes, dry wells, etc. Based on the preliminary plans (CDM Smith, 2020), excavations for the proposed BMP improvements are anticipated to be on the order of 8 to 20 feet in depth and the dry wells are anticipated to be on the order of 50 feet in depth. The earthwork will involve the removal of undocumented fill and waste. Earthwork will also include finish grading for establishment of site drainage. Earthwork operations should be performed in accordance with the requirements of applicable governing agencies and the recommendations presented in the following sections.

12.2.1 Pre-Construction Conference

We recommend that grading and foundation plans be submitted to Ninyo & Moore for review to check for conformance to the recommendations provided in this report. We further recommend that a pre-construction conference be held to discuss the grading recommendations presented in this report. The owner and/or their representative, the governing agencies' representatives, the civil engineer, Ninyo & Moore, and the contractor should be in attendance to discuss the work plan, project schedule, and earthwork and mitigation requirements.

12.2.2 Clearing and Site Preparation

Prior to excavating or other earthwork, the proposed area of improvements should be cleared of surface obstructions, debris, pavement, abandoned utilities, and other deleterious materials. Obstructions that extend below finish grade, if any, should be removed and the resulting holes filled with compacted soils. Materials generated from the clearing operations should be removed from the project site and disposed at a legal dump site.

12.2.3 Excavation Characteristics

We anticipate that excavations and drilling in the undocumented fill, waste, and alluvium should be feasible with earthmoving equipment and drilling equipment in good working order. The fill and alluvial materials generally consist of moist, very loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, clayey sand, and sandy silt. Variable amounts of gravel and cobbles were encountered in the fill and alluvium and should be anticipated in the excavations. The waste encountered in our exploratory excavations consisted of pieces of AC, PCC, brick, glass, ceramic, plastic, glass bottles, and tires. Other materials may also be present in the waste. The contractor should anticipate handling and disposal of oversize materials. Difficult excavating and drilling conditions should be anticipated by the contractor where excavations encounter dense gravel, cobbles, and waste within the fill and alluvium. Specialty equipment may also be needed for excavating and drilling through oversized waste. Processing of the materials to bring them near the laboratory optimum moisture content (i.e., drying and/or wetting) prior to use as fill should be planned by the contractor.

12.2.4 Subgrade Preparation for the Infiltration Gallery

Based on our exploratory borings, test pits, and CPTs, alluvium is anticipated at the bottom of the planned infiltration gallery that should be suitable for support of the gallery and overlying compacted fill. The excavation bottom should be evaluated by our representative during the excavation work. In the event that unsuitable material is encountered along the bottom of the excavation, including undocumented fill and/or waste, the unsuitable material should be removed and replaced with loosely-packed clean sand or gravel, such as additional drainage rock. The actual recommendations for removal and replacement should be based on our field observations. We recommend that minimal compaction be performed on the exposed subgrade, materials used to replace unsuitable materials (if needed), and/or rock blanket beneath the gallery. We recommend that the rock blanket consist of open-graded gravel of ¾-inch to 1½-inch diameter rock underlain by filter fabric consisting of Mirafi 140N or equivalent. Compaction of the subgrade could potentially reduce the infiltration rate of the gallery. If the subgrade of the infiltration gallery is compacted, we recommend that additional percolation testing be performed.

If foundations are to be installed along the bottom of the gallery, such as strip footings, the upper approximately 8-inches of subgrade, only beneath the foundations, should be scarified, moisture-conditioned to near optimum moisture content, and recompacted to a relative compaction of 90 percent as evaluated by ASTM D 1557. If unsuitable materials, including undocumented fill, waste, loose/soft, and/or wet materials, are encountered along the

excavation bottom that extend beneath proposed footings, specific recommendations for removal and replacement of these materials, if warranted, will be provided by our firm based on field observations.

12.2.5 Subgrade Preparation for Other Buried Structures and At-Grade Structures

In order to provide suitable support for proposed buried and/or at-grade structures, including, the new diversion structure, pump station, HDS units, and manholes, we recommend that the existing undocumented fill, waste, and upper loose alluvial deposits be removed from beneath the structures. In addition, the structure foundations should be founded on 2 feet or more of newly compacted fill material. The over-excavation should remove undocumented fill/waste and expose relatively dense alluvial deposits. Additional overexcavation of loose, soft, and/or wet areas may be appropriate. The excavation bottom should be evaluated by our representative during the excavation work and additional recommendations, if needed, be based on field observations. The limits of removal should extend approximately 2 feet beyond the footprint of the foundations. If drainage rock is placed beneath the foundations, this can be considered part of the 2-foot thick layer of compacted fill beneath the foundations. Prior to placing compacted fill and/or drainage rock, the upper approximately 8 inches of the exposed bottom should be scarified, moisture-conditioned to near optimum moisture content, and recompacted to a relative compaction of 90 percent as evaluated by ASTM D 1557.

12.2.6 Temporary Excavations and Shoring

We recommend that excavations be designed and constructed in accordance with OSHA regulations. These regulations provide shoring design parameters for excavations and trenches up to 20 feet deep based on the soil types encountered. Trenches over 20 feet deep should be designed by the contractor's engineer based on site-specific geotechnical analyses. For planning purposes, we recommend that fill and alluvium be considered as OSHA Type C soil. For trench or other excavations, OSHA requirements regarding personnel safety should be met by using appropriate shoring or by laying back the slopes no steeper than 1½:1 (horizontal to vertical) in the site fill and alluvium. Temporary excavations that encounter seepage may need shoring or may be mitigated by placing sandbags or gravel along the base of the seepage zone. Excavations encountering seepage should be evaluated on a case-by-case basis.

We anticipate that site excavations will be laid-back using temporary slopes. Where slopes cannot be laid back, shoring may be appropriate. If shoring systems are used for site excavations, they should be designed for the anticipated soil conditions using the lateral earth

pressure values shown on Figures 9 through 10 for braced and cantilevered excavations, respectively. The recommended design pressures are based on the assumption that the shoring system is constructed without raising the ground surface elevation behind the shored sidewalls of the excavation, that there are no surcharge loads, such as soil stockpiles and construction materials, and that no loads act above a 1:1 (horizontal to vertical) plane ascending from the base of the shoring system. For a shoring system subjected to the above-mentioned surcharge loads, the contractor should include the effect of these loads on the lateral earth pressures acting on the shored walls.

We anticipate that settlement of the ground surface will occur behind the shored excavations. The amount of settlement depends heavily on the type of shoring system, the contractor's workmanship, and soil conditions. To reduce the potential for distress to adjacent improvements, we recommend that the shoring system be designed to limit the ground settlement behind the shoring system to ½ inch or less. Possible causes of settlement that should be addressed include settlement during installation of the shoring elements, excavation for structure construction, construction vibrations, and removal of the support system. We recommend that shoring installation be evaluated carefully by the contractor prior to construction and that ground vibration and settlement monitoring be performed during construction.

The contractor should retain a qualified and experienced engineer to design the shoring system. The shoring parameters presented in this report are minimum requirements, and the contractor should evaluate the adequacy of these parameters and make the appropriate modifications for their design. We recommend that the contractor take appropriate measures to protect workers. OSHA requirements pertaining to worker safety should be observed.

12.2.7 Fill Material

In general, the on-site soils below or outside the lateral extents of the on-site waste materials should be suitable for reuse as fill materials, provided they are free of trash, debris, oversize material, or other deleterious materials. Fill should generally be free of rocks or lumps of material in excess of 4 inches in diameter. Rocks or hard lumps larger than approximately 4 inches in diameter should be broken into smaller pieces or should be removed from the site. The waste material should not be reused as fill material.

Imported fill material, if used, should also consist of clean, granular material with a low expansion potential, corresponding to an expansion index of 50 or less. The soil should also be tested for corrosive properties prior to importing. We recommend that the imported materials satisfy the Caltrans (2018) criteria for non-corrosive soils (i.e., soils having a

chloride concentration of 500 parts per million [ppm] or less, a soluble sulfate content of approximately 0.15 percent (1,500 ppm) or less, a pH value of 5.5 or higher, or an electrical resistivity of 1,100 ohm-centimeters or more). Materials for use as fill should be evaluated by Ninyo & Moore prior to importing. The contractor should be responsible for the uniformity of import material brought to the site.

12.2.8 Fill Placement and Compaction

In general, fill material, including retaining wall, trench backfill, fill placed beneath gallery footings, and other, should be moisture-conditioned and compacted in horizontal lifts to a relative compaction of 90 percent or more as evaluated by ASTM D 1557. Fill material with less than 5 percent fines (passing No. 200 sieve) should be compacted to 95 percent relative compaction in accordance with City of Los Angeles guidelines as evaluated by ASTM D 1557. The rock blanket and granular materials placed as fill along the bottom of the gallery excavation, with the exception of fill placed beneath footings, should generally not be compacted. Fill material should be moisture-conditioned to slightly above the laboratory optimum moisture content. The lift thickness for fill soils will depend on the type of compaction equipment used but generally should not exceed 8 inches in loose thickness. Special care should be exercised to avoid damaging pipes during compaction of trench backfill. Placement and compaction of the fill soils should be in general accordance with local grading ordinances and good construction practice.

12.3 Underground Utilities

We anticipate that underground pipelines will be supported on native alluvial deposits. Based on the preliminary plans, pipeline inverts may be on the order of 13 feet in depth.

12.3.1 Pipe Bedding

We recommend that pipes be supported on 6 inches or more of granular bedding material, such as sand, with a sand equivalent value of 30 or more. Bedding material should be placed around the pipe and 12 inches or more above the top of the pipe in accordance with the current “Greenbook” Standard Specifications for Public Works. Special care should be taken not to allow voids beneath the pipe. Compaction of the bedding material and backfill should proceed up both sides of the pipe. Trench backfill, including bedding material, should be placed in accordance with the recommendations presented in Section 12.2.

12.3.2 Modulus of Soil Reaction for Pipe Design

The modulus of soil reaction is used to characterize the stiffness of soil backfill placed along the sides of buried flexible pipelines for the purpose of evaluating deflection caused by the

weight of the backfill above the pipe. We recommend that a modulus of soil reaction of 1,000 pounds per square inch be used for design, provided that granular bedding material is placed adjacent to the pipe, as recommended in the previous section.

12.4 Site-Specific Seismic Design Considerations

Design of the proposed improvements should be performed in accordance with the requirements of governing jurisdictions and applicable building codes. Table 2 presents the site-specific spectral response acceleration parameters in accordance with the CBC (2019) guidelines.

Table 2 – 2019 California Building Code Seismic Design Criteria

Site Coefficients and Spectral Response Acceleration Parameters	Values
Site Class	D
Mapped Spectral Response Acceleration at 0.2-second Period, S_s	1.935g
Mapped Spectral Response Acceleration at 1.0-second Period, S_1	0.658g
Site-Specific Spectral Response Acceleration at 0.2-second Period, S_{MS}	2.182g
Site-Specific Spectral Response Acceleration at 1.0-second Period, S_{M1}	1.770g
Site-Specific Design Spectral Response Acceleration at 0.2-second Period, S_{DS}	1.455g
Site-Specific Design Spectral Response Acceleration at 1.0-second Period, S_{D1}	1.180g
Site-Specific Maximum Considered Earthquake Geometric Mean (MCE_G) Peak Ground Acceleration, PGA_M	0.834g

12.5 Foundations

It is our opinion that the proposed infiltration gallery may be supported on strip footings and that other underground structures (i.e., diversion structure, HDS units, etc.) may be supported by mat foundations. Spread foundations may also be used to support other at-grade structures, if planned. The following are our recommendations for project foundations:

12.5.1 Spread Footings for Infiltration Gallery and At-Grade Structures

Spread footings for the infiltration gallery (i.e., strip footings) should be placed directly on low expansion alluvial materials and/or compacted fill in accordance with the recommendations presented in the Earthwork section of this report. Spread footings for at-grade structures bearing on low expansion compacted fill in accordance with the recommendations presented in the Earthwork section of this report should extend 18 inches or more below the lowest adjacent finished grade. Continuous and isolated footings should have a width of 24 inches or more. Continuous footings should be reinforced with two No. 4 steel reinforcing bars, one placed near the top and one placed near the bottom of the footings, and further detailed in accordance with the recommendations of the structural engineer.

Footings, as described above and bearing on alluvial materials and compacted fill, may be designed using a net allowable bearing capacity of 2,500 pounds per square foot (psf). Total and differential settlements for footings designed in accordance with the above

recommendations are estimated to be less than approximately 1 inch and ½ inch over a horizontal span of 40 feet, respectively.

Footings bearing on alluvial materials and compacted fill may be designed using a coefficient of friction of 0.35, where the total frictional resistance equals the coefficient of friction times the dead load. Footings may be designed using a passive resistance value of 300 psf per foot of depth, with a maximum value of 3,000 psf. The allowable lateral resistance can be taken as the sum of the frictional resistance and passive resistance, provided the passive resistance does not exceed one-half of the total allowable resistance. The passive resistance (including the maximum value) may be increased by one-third when considering loads of short duration such as wind or seismic forces.

12.5.2 Mat Foundations

Mat foundations for other underground structures (i.e., diversion structure, HDS units, etc.) may be supported on alluvial materials and/or compacted fill in accordance with the recommendations presented in the Earthwork section of this report. Foundations should be designed in accordance with structural considerations and the following recommendations. In addition, requirements of the appropriate governing jurisdictions and applicable building codes should be considered in the design of the structures.

The mat foundations may be designed using a net allowable bearing capacity of 4,000 pounds per square foot (psf). The total and differential settlement corresponding to this allowable bearing load are estimated to be less than approximately 1 inch and ½ inch over a horizontal span of 40 feet, respectively.

Mat foundations typically experience some deflection due to loads placed on the mat and the reaction of the soils directly underlying the mat. A design modulus of subgrade reaction (K) of 50 tons per cubic foot (tcf) may be used for the subgrade soils in evaluating such deflections

12.6 Lateral Earth Pressures

Walls for below-grade structures when constructed as recommended above may be designed for lateral pressures represented by the pressure diagram on Figure 11. To reduce the potential for pipe-to-wall differential settlement, which could cause pipe shearing, we recommend that a flexible pipe joint be located close to the exterior of the wall. The type of joint should be such that minor relative movement can be accommodated without distress. The pipe connections should be sufficiently flexible to withstand differential settlement of approximately ¾ inch.

12.7 Exterior Flatwork

We recommend that new exterior concrete sidewalks and flatwork (hardscape) have a thickness of 4 inches and be reinforced with No. 3 steel reinforcing bars placed 24 inches on-center (each way) near the mid-height of the slab. The hardscape should be underlain by 4 inches of clean sand and installed with crack-control joints at an appropriate spacing as designed by the structural engineer to reduce the potential for shrinkage cracking. Positive drainage should be established and maintained adjacent to flatwork. To reduce the potential for differential offset, joints between the new hardscape and adjacent curbs, existing hardscape, building walls, and/or other structures, and between sections of new hardscape, should be doweled.

12.8 Corrosivity

Laboratory testing was performed on representative samples of near-surface soil to evaluate soil pH, electrical resistivity, water-soluble chloride content, and water-soluble sulfate content. The soil pH and electrical resistivity tests were performed in general accordance with California Test Method (CT) 643. Chloride content tests were performed in general accordance with CT 422. Sulfate testing was performed in general accordance with CT 417. The laboratory test results are presented in Appendix d.

The soil pH of the samples tested was measured to range from 6.9 to 7.4 and the electrical resistivity was measured to range from 2,363 to 6,922 ohm-centimeters. The chloride content of the samples was measured to be 30 ppm. The sulfate content of the samples was measured to range from 0.005 to 0.008 percent by weight (i.e., 50 to 80 ppm). Based on the laboratory test results and Caltrans criteria (2018), the project site can be classified as a non-corrosive site, which is defined as having earth materials with a pH of more than 5.5, an electrical resistivity of more than 1,100 ohm-centimeters, chloride concentrations of less than 500 ppm, and less than 0.15 percent sulfates (i.e., 1,500 ppm).

12.9 Concrete Placement

Concrete in contact with soil or water that contains high concentrations of water-soluble sulfates can be subject to premature chemical and/or physical deterioration. Based on the CBC (2019), the potential for sulfate attack is negligible for water-soluble sulfate contents in soil ranging from 0.00 to 0.10 percent by weight, moderate for water-soluble sulfate contents ranging from 0.10 to 0.20 percent by weight, severe for water-soluble sulfate contents ranging from 0.20 to 2.00 percent by weight, and very severe for water-soluble sulfate contents over 2.00 percent by weight. The soil samples tested for this evaluation, using CT 417, indicate a water-soluble sulfate content ranging from approximately 0.005 to 0.008 percent by weight (i.e., 50 to 80 ppm). Accordingly, the on-site soils are considered to have a negligible potential for sulfate attack.

However, due to the potential variability of the on-site soils, consideration should be given to using Type II/V cement for the project.

To reduce the potential for shrinkage cracks in the concrete during curing, we recommend that the concrete for the proposed improvements, if applicable, be placed with a slump of 4 inches based on ASTM C 143. The slump should be checked periodically at the site prior to concrete placement. We further recommend that concrete cover over reinforcing steel for foundations be provided in accordance with CBC (2019). The structural engineer should be consulted for additional concrete specifications.

12.10 Stormwater Infiltration Gallery

Based on our subsurface evaluation, the park is generally underlain by granular alluvial deposits consisting of poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, and sandy silt. The wide range of infiltration rates (1.9 to 6.9 inches per hour) is likely due to lateral and vertical variations in material types and densities, including higher fines contents of alluvial interbeds and lenses. Based on our review of our boring logs and laboratory test results, we recommend that an infiltration rate of 4 inches per hour, following adjustments by the BMP designer for RF_s, be used for design at Strathern Park North for both shallow and deep infiltration. However, we recommend that the bottoms of the infiltration BMPs be further evaluated during construction. Additional recommendations may be provided at that time if fine-grained materials are present along the bottom of the basin, such as removing the fine-grained material and replacing it with granular material.

Based on our evaluation, the potential for hydro-collapse settlement associated with infiltration is generally low due to the proposed depth of infiltration. However, we generally recommend a setback of 15 feet or more between settlement sensitive structures and proposed infiltration areas.

12.11 Drainage

Proper surface drainage is imperative for satisfactory site performance. Positive drainage should be provided and maintained to direct surface water away from existing foundations. Positive drainage is defined as a slope of 2 percent or more for a distance of 5 feet or more away from foundations and tops of slopes. Surface waters should not be allowed to pond adjacent to footings. We recommend that above-ground structures, if constructed, have roof drains and downspouts installed to collect runoff.

12.12 Landscaping

Project landscaping should consist of drought tolerant plants. Landscape irrigation should be kept to a level just sufficient to maintain plant vigor. Overwatering should not be permitted

13 CONSTRUCTION OBSERVATION

The recommendations provided in this report are based on our understanding of the proposed project and our evaluation of the data collected based on subsurface conditions disclosed by widely spaced exploratory borings, test pits, and CPTs. It is imperative that the geotechnical consultant checks the interpolated subsurface conditions during construction. We recommend that Ninyo & Moore review the project plans and specifications prior to construction. It should be noted that, upon review of these documents, some recommendations presented in this report may be revised or modified.

During construction we recommend that the duties of the geotechnical consultant include, but not be limited to:

- Observing site clearing, grubbing, and removals including undocumented fill and waste.
- Observing excavation bottoms, and the placement and compaction of fill, including trench backfill.
- Observing the drilling of dry wells, if chosen for the project.
- Evaluating imported materials prior to their use as fill (if used).
- Performing field tests to evaluate fill compaction.
- Observing foundation excavations for bearing materials and cleaning prior to placement of reinforcing steel or concrete.
- Performing material testing services including concrete compressive strength and steel tensile strength tests and inspections.

The recommendations provided in this report assume that Ninyo & Moore will be retained as the geotechnical consultant during the construction phase of this project. If another geotechnical consultant is selected, we request that the selected consultant indicate to the owner and to our firm in writing that our recommendations are understood and that they are in full agreement with our recommendations.

14 LIMITATIONS

The field evaluation, laboratory testing, and geotechnical analysis presented in this geotechnical report have been conducted in general accordance with current practice and the standard of care exercised by geotechnical consultants performing similar tasks in the project area. No warranty, expressed or implied, is made regarding the conclusions, recommendations, and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be encountered during construction. Uncertainties relative to subsurface conditions can be reduced

through additional subsurface exploration. Additional subsurface evaluation will be performed upon request. Please also note that our evaluation was limited to assessment of the geotechnical aspects of the project, and did not include evaluation of structural issues, environmental concerns, or the presence of hazardous materials.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

This report is intended for design purposes only. It does not provide sufficient data to prepare an accurate bid by contractors. It is suggested that the bidders and their geotechnical consultant perform an independent evaluation of the subsurface conditions in the project areas. The independent evaluations may include, but not be limited to, review of other geotechnical reports prepared for the adjacent areas, site reconnaissance, and additional exploration and laboratory testing.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. If geotechnical conditions different from those described in this report are encountered, our office should be notified, and additional recommendations, if warranted, will be provided upon request. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

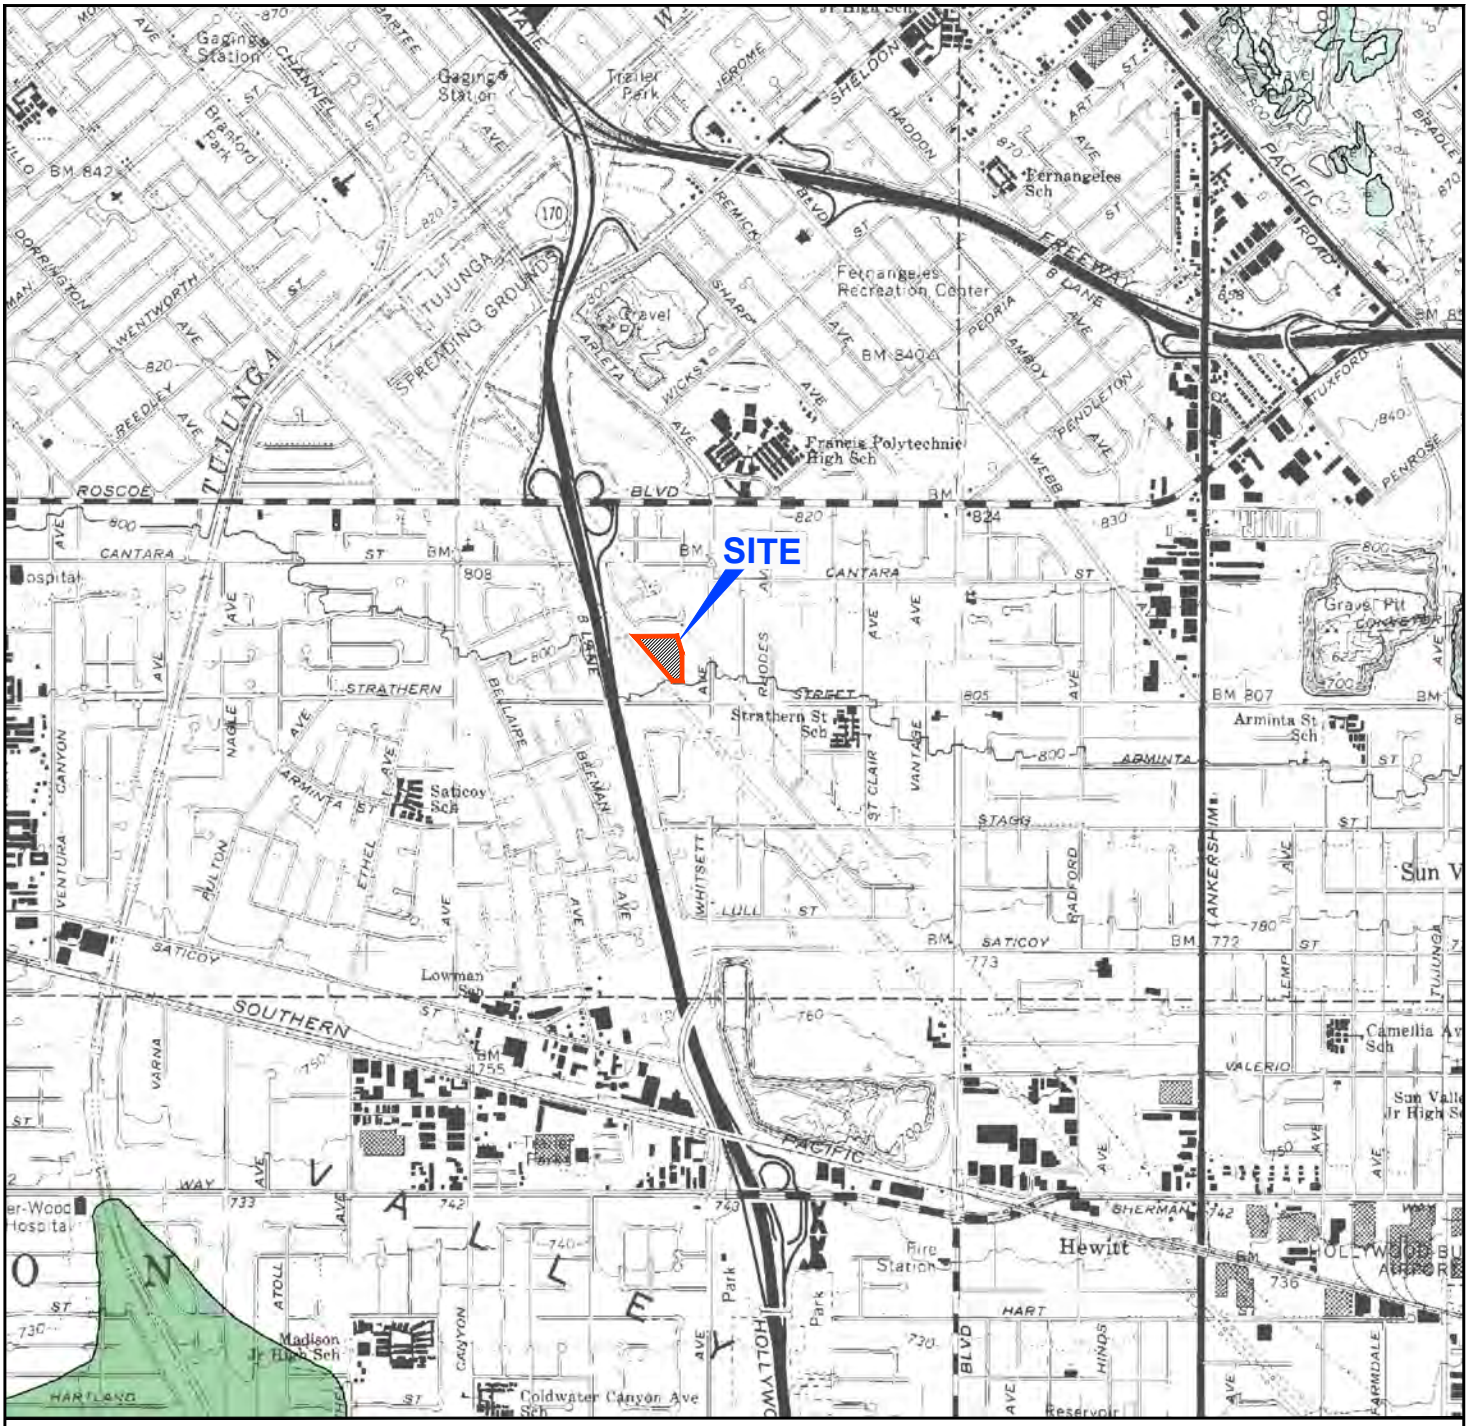
NOTES:

1 The probabilistic ground motion spectral response accelerations are based on the risk-targeted Maximum Considered Earthquake (MCE_R) having a 2% probability of exceedance in 50 years in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships and the risk coefficients.

2 The deterministic ground motion spectral response accelerations are for the 84th percentile of the geometric mean values in the maximum direction using the Chiou & Youngs (2014), Campbell & Bozorgnia (2014), Boore et al. (2014), and Abrahamson et al. (2014) attenuation relationships for deep soil sites considering a Mw 7.3 even on the Hollywood fault zone located 6.54 kilometers from the site. It conforms with the lower bound limit per ASCE 7-16 Section 21.2.2.

3 The Site-Specific MCE_R Response Spectrum is the lesser of spectral ordinates of deterministic and probabilistic accelerations at each period per ASCE 7-16 Section 21.2.3. The Site-Specific Design Response Spectrum conforms with lower bound limit per ASCE 7-16 Section 21.3.



4 The Mapped Design MCE_R Response Spectrum is computed from mapped spectral ordinates modified for Site Class D (stiff soil profile) per ASCE 7-16 Section 11.4. It is presented for the sake of comparison.

APPENDIX A

Boring Logs

APPENDIX A

BORING LOGS

Field Procedure for the Collection of Disturbed Samples

Disturbed soil samples were obtained in the field using the following method.

Bulk Samples

Bulk samples of representative earth materials were obtained from the exploratory borings. The samples were bagged and transported to the laboratory for testing.

The Standard Penetration Test (SPT) Sampler

Disturbed drive samples of earth materials were obtained by means of a Standard Penetration Test sampler. The sampler is composed of a split barrel with an external diameter of 2 inches and an unlined internal diameter of 1-3/8 inches. The sampler was driven into the ground 12 to 18 inches with a 140-pound hammer free-falling from a height of 30 inches in general accordance with ASTM D 1586. The blow counts were recorded for every 6 inches of penetration; the blow counts reported on the logs are those for the last 12 inches of penetration. Soil samples were observed and removed from the sampler, bagged, sealed and transported to the laboratory for testing.

Field Procedure for the Collection of Relatively Undisturbed Samples

Relatively undisturbed soil samples were obtained in the field using the following method.

The Modified Split-Barrel Drive Sampler

The sampler, with an external diameter of 3 inches, was lined with 1-inch-long, thin brass rings with inside diameters of approximately 2.4 inches. The sample barrel was driven into the ground with the weight of a hammer in general accordance with ASTM D 3550. The driving weight was permitted to fall freely. The approximate length of the fall, the weight of the hammer, and the number of blows per foot of driving are presented on the boring logs as an index to the relative resistance of the materials sampled. The samples were removed from the sample barrel in the brass rings, sealed, and transported to the laboratory for testing.

40			22			-		SP	ALLUVIUM: (Continued) Light brown, moist, dense, poorly graded SAND; trace gravel; few coarse sand.
			27					SP-SM	Light brown, moist, medium dense, poorly graded SAND with silt and gravel.
50			52						Very dense; few to little gravel.
									Total Depth = 51.5 feet. Groundwater was not encountered during drilling. In-situ percolation testing performed on 4/15/20. Backfilled with cement-bentonite grout on 4/16/20. Notes: Groundwater, though not encountered at the time of drilling, may rise to a higher level due to seasonal variations in precipitation and several other factors as discussed in the report. The ground elevation shown above is an estimation only. It is based on our interpretations of published maps and other documents reviewed for the purposes of this evaluation. It is not sufficiently accurate for preparing construction bids and design documents.

APPENDIX B

TEST PIT LOGS

Field Procedure for the Collection of Disturbed Samples

Disturbed soil samples were obtained in the field using the following method.

Bulk Samples

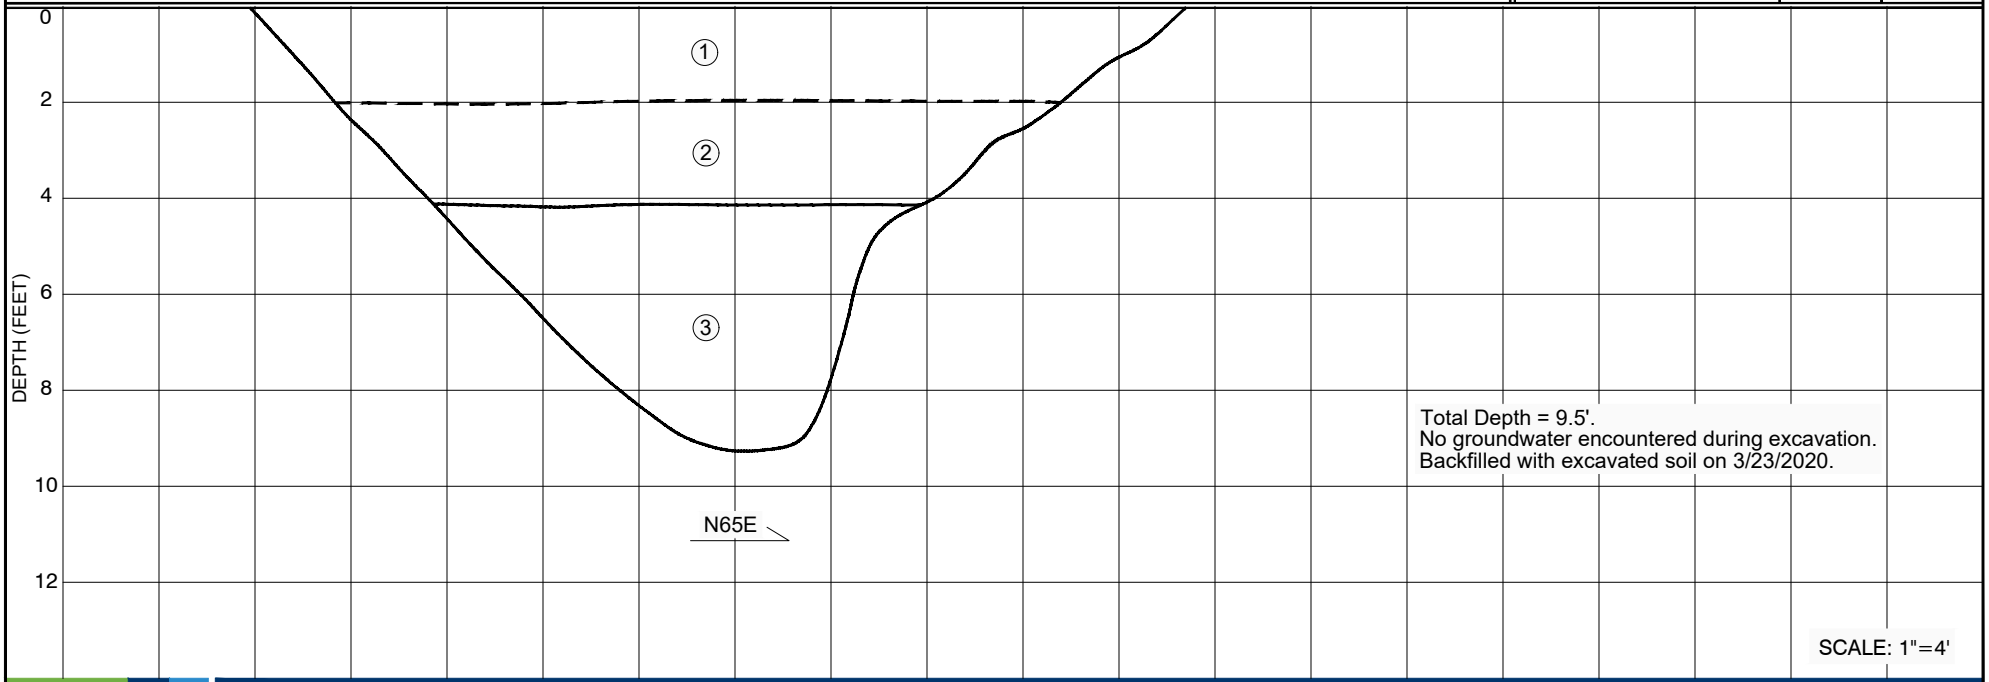
Bulk samples of representative earth materials were obtained from the exploratory borings. The samples were bagged and transported to the laboratory for testing.

LOCATION: See Figure 4	TEST PIT NO.: TP-1	SAMPLES/ FIELD TESTS	MOISTURE (%)
GROUND ELEVATION: 807'± (msl)	LOGGED BY: KMB		
METHOD OF EXCAVATION: JD 310 SG Backhoe (Newman)	DATE EXCAVATED: 3/23/2020		

DESCRIPTION

FILL:

(1) Brown, moist, soft to firm, lean CLAY (CL); trace gravel; few organics.



(2) Brown to light brown, moist, loose to medium dense, poorly graded SAND (SP); few gravel; cobbles up to approximately 6 inches in diameter.

ALLUVIUM:

(3) Light brown, moist, loose to medium dense, poorly graded SAND with gravel and cobbles (SP); interbeds of poorly graded GRAVEL with sand and cobbles (GP).

4.0'-5.0': Bulk Bag

8.0'-9.0': Bulk Bag

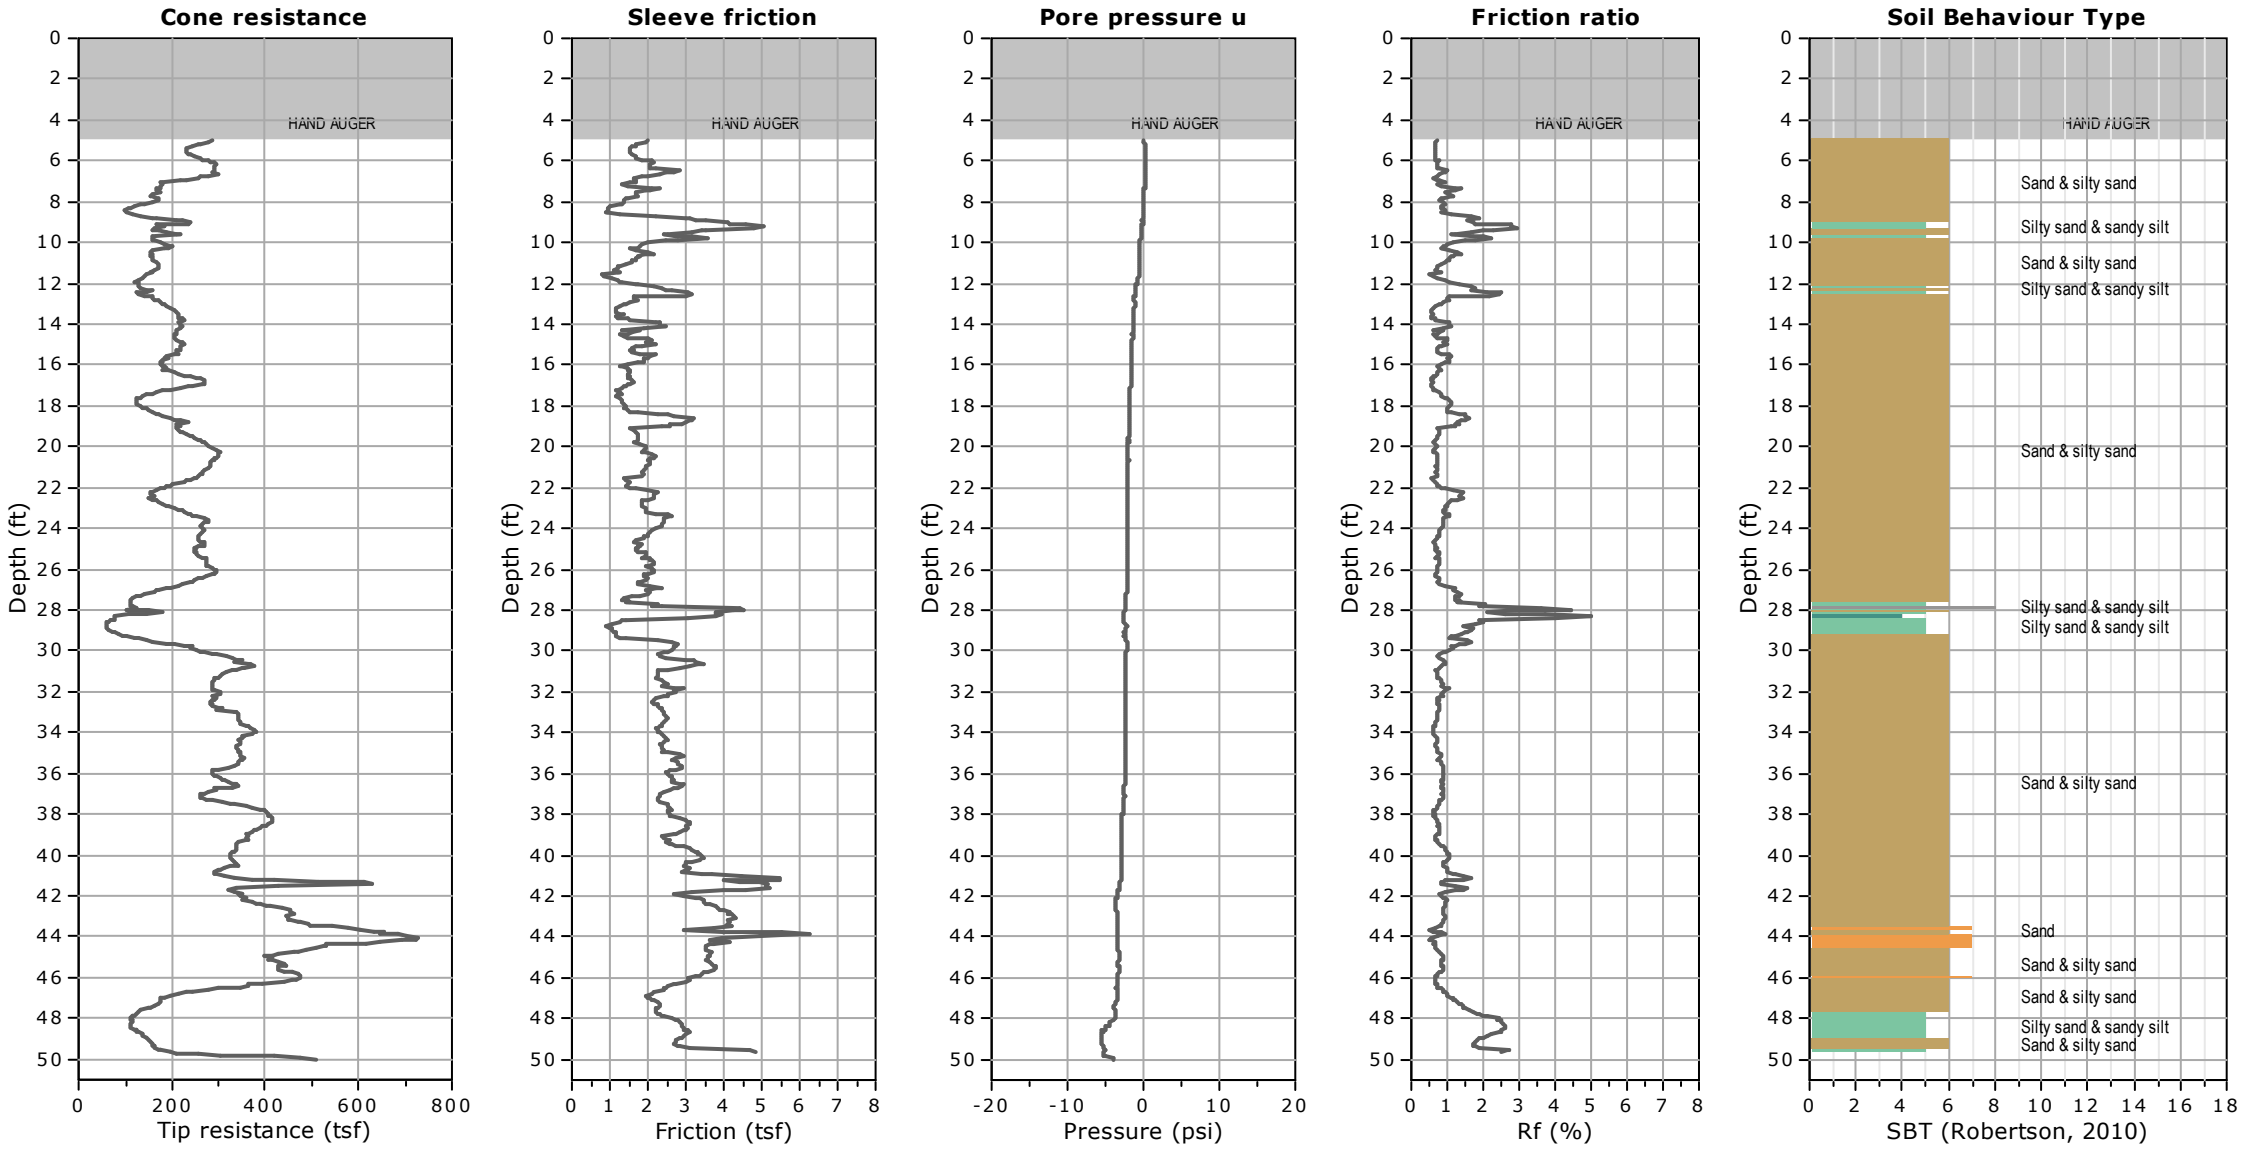
CPT Soundings

APPENDIX C

CPT SOUNDINGS



Field Procedure for Cone Penetration Testing

The cone penetration testing (CPT) described in this report was conducted by Kehoe Testing and Engineering in general accordance with ASTM D 5778. The cone penetrometer assembly used for this project consisted of a conical tip and a cylindrical friction sleeve. The conical tip had an apex angle of 60 degrees and a cross-section area of approximately 15 square centimeters. The interior of the CPT probe was instrumented with strain gauges that allowed simultaneous measurement of cone tip resistance and friction sleeve resistance during penetration. The cone hydraulically pushed into the soil using the reaction mass of a specially designed 30-ton truck at a constant rate while the cone tip resistance and sleeve friction were recorded at an approximately 1-inch interval and stored in digital form. The computer generated logs presented in the following pages include cone resistance, sleeve friction, pore pressure, and soil behavior type.

APPENDIX D

Geotechnical Laboratory Testing

APPENDIX D

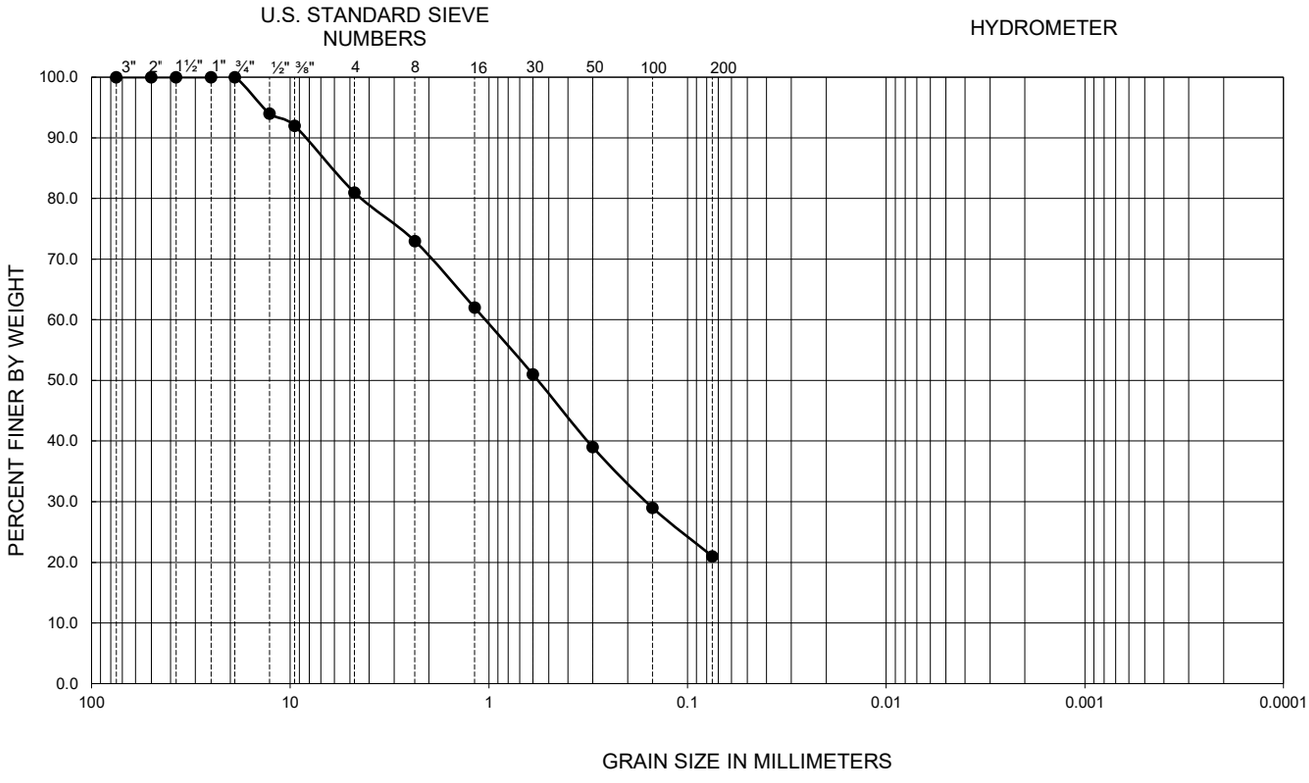
GEOTECHNICAL LABORATORY TESTING

Classification
Soils were visually and texturally classified in accordance with the Unified Soil Classification System (USCS) in general accordance with ASTM D 2488. Soil classifications are indicated on the logs of the exploratory borings and test pit logs in Appendices B and C.

In-Place Moisture and Density Tests
The moisture content and dry density of relatively undisturbed samples obtained from the exploratory borings were evaluated in general accordance with ASTM D 2937. The test results are presented on the logs of the exploratory borings in Appendix B.

Gradation Analysis
Gradation analysis tests were performed on selected representative soil samples in general accordance with ASTM D 422. The grain-size distribution curves are shown on Figures D-1 through D-6. These test results were utilized in evaluating the soil classifications in accordance with the USCS.

200 Wash
An evaluation of the percentage of particles finer than the No. 200 sieve in selected soil samples was performed in general accordance with ASTM D 1140. The results of the tests are presented on Figure D-7.



Atterberg Limits
Tests were performed on a selected representative fine-grained soil sample to evaluate the liquid limit, plastic limit, and plasticity index in general accordance with ASTM D 4318. These test results were utilized to evaluate the soil classification in accordance with the USCS. The test results and classification are shown on Figure D-8.

Consolidation Test
Consolidation testing was performed on selected relatively undisturbed soil samples in general accordance with ASTM D 2435. The samples were inundated during testing to represent adverse field conditions. The percent of consolidation for each load cycle was recorded as a ratio of the amount of vertical compression to the original height of the sample. The results of the tests are summarized on Figures D-9 and D-10.

Direct Shear Tests
Direct shear tests were performed on relatively undisturbed samples in general accordance with ASTM D 3080 to evaluate the shear strength characteristics of selected materials. The samples were inundated during shearing to represent adverse field conditions. The results are shown on Figures D-11 and D-12.

Soil Corrosivity Tests
Soil pH and resistivity tests were performed on representative samples in general accordance with California Test (CT) 643. The soluble sulfate and chloride content of the selected samples were evaluated in general accordance with CT 417 and CT 422, respectively. The test results are presented on Figure D-13.

Case Narrative

Ninyo & Moore 475 Goddard Suite 200 Irvine, CA 92618 Keith Gilbert	Lab Job Number:	426449
	Location:	Strathern Park Soil Sampling / 8041 Whitsett Ave., No. Hollywood, CA
	Date Received:	03/25/20

This data package contains sample and QC results for two soil samples, requested for the above referenced project on 03/25/20. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):
High RPD was observed for diesel C10-C28 in the MS/MSD of P-4-10' (lab # 426382-012); the high RPD was not associated with any reported results. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
Low recoveries were observed for barium and antimony in the MS/MSD of WC-1 (lab # 426449-001); the LCS was within limits, and the associated RPDs were within limits. No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore

Project: Strathern Park Soil Sampling

Date Received: 03/25/2020

Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2)

Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.4 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.1 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____ ☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 03/25/2020

List any exception to items listed above: Scale Ticket # 160208

Generator's and/or consultant's certification: I/We certify that the soil referenced herein is taken entirely from those soils descried in the Soil Data Sheet completed and certified by me/us for the Generation Site shown above and nothing has been added or done to such soil that would alter it in any way.

Print or Type Name: Generator ☑ Consultant ☐	Signature and date:	Month	Day	Year
Michael Fusco	Michael Fusco	5	6	20

Transporter

Transporter's certification: I/We acknowledge receipt of the soil referenced above and certify that such soil is being delivered in exactly the same condition as when received. I/We further certify that the soil is being directly transported from the Generation Site to the Designated Facility without off-loading, adding to, subtracting from or in any way delaying delivery to such site.

Print or Type Name:	Signature and date:	Month	Day	Year
Carlos Villa	Carlos Villa	05	06	20

Recycling Facility

Discrepancies:
8041WHIT
2289299

Recycling Facility certifies the receipt of the soil covered by this manifest except as noted above:

Print or Type Name:	Signature and date:
J. PROVANSAL	5-14-20

1 INTRODUCTION

Ninyo & Moore conducted a limited Phase II Environmental Site Assessment (Phase II ESA) at a portion of Strathern Park North located at 8041 Whitsett Avenue in North Hollywood, California as part of the Los Angeles Bureau of Engineering (LABOE) Stormwater Capture Parks Program (Figures 1 and 2). The Phase II ESA was performed in general accordance with the City of Los Angeles (City), Task Order Solicitation (TOS) No. 25 (LABOE, 2019a), Addendum No. 5 (Addendum No. 5), dated August 2, 2019 and our proposal dated January 23, 2020, that was based on the addendum (Ninyo & Moore, 2020a).

The Phase II ESA was performed in conjunction with a geotechnical evaluation, the purpose of which was to evaluate the soil and geologic conditions at the site and to provide geotechnical recommendations for pre-design of proposed Best Management Practices (BMPs) at the site for stormwater infiltration. The geotechnical study is provided as a separate report (Ninyo & Moore, 2020b). Boring and test pit logs from both the Phase II ESA and geotechnical evaluation are provided in this report for reference (Appendix A).

The intent of the Stormwater Capture Parks Program is to capture up to 2,912 acre-feet of stormwater and urban runoff per year that drain from 5,868 acres within a portion of the San Fernando Valley in order to reduce the potential for flooding, improve stormwater quality, increase water supplies through stormwater capture and groundwater recharge, and provide recreational, social, and economic benefits (LABOE, 2019a). The stormwater runoff will be diverted into proposed stormwater capture and groundwater recharge and infiltration BMPs within nine City parks generally located along the State Route (SR)-170 corridor, including the subject Strathern Park North, for replenishment of the San Fernando Groundwater Basin. According to the Conceptual Study Report (CSR) (Los Angeles Department of Water & Power [LADWP], 2018), the project at Strathern Park North is anticipated to capture and infiltrate stormwater runoff from a tributary area of approximately 485 acres.

2 PROJECT DESCRIPTION AND PROPOSED CONSTRUCTION

Based on our review of TOS 25 (LABOE, 2019a), the project generally consists of the installation of new BMPs within the undeveloped western approximate half of Strathern Park North to infiltrate storm water diverted from the existing 45-inch-diameter reinforced concrete pipe (RCP) storm drain along SR-170 (Figures 3 and 4). The new BMPs would consist of the installation of an underground infiltration gallery, a catch basin, diversion structure, pump station, hydrodynamic separator (HDS) units, flow measuring devices, supervisory control and data acquisition, educational signage, and park restoration/improvements. According to the CSR (LADWP, 2018),

the conceptual infiltration gallery would be sized to store approximately 968,000 cubic feet of water and include a footprint of approximately 97,700 square feet (sf), an inner height of approximately 12 feet, and an invert depth of approximately 17 feet below the ground surface (bgs). We understand that the galleries will likely consist of prefabricated, modular concrete vaults with open bottoms underlain by drain rock over a layer of filter fabric. Concrete foundations could be constructed depending on the type of system selected. We understand that upon completion of the BMP installation, the BMPs will be buried with compacted fill and the ground surface returned to its existing condition for continued use as a park.

Subsequent to performing the geotechnical evaluation and Limited Phase II ESA, we received conceptual plans from our client (CDM Smith, 2020), which include four BMP options (Alternatives 1 through 4) for the project. The improvements associated with Alternatives 1 through 3 will generally be constructed within the undeveloped portion of the park (west of the baseball fields). Alternative 4 provides an option to build beneath the baseball fields. We understand that these proposed alternatives are subject to change as further design is performed. The four options are described below.

Alternative 1 - According to CDM Smith (2020), Alternative 1 consists of the installation of a subterranean infiltration gallery (97,700 sf) with an interior height of 12 feet and invert depth of approximately 17 feet, a diversion structure on the existing 45-inch-diameter RCP storm drain and a catch basin at the southern end of Potter Avenue. New 36 and 42-inch-diameter pipelines would be installed between the diversion structure and gallery with an in-line HDS unit and pump station. The catch basin will be connected to the gallery via an additional pipeline. The proposed layout of Alternative 1 is presented on Figure 3.

Alternative 2 - Alternative 2 is similar to Alternative 1 except that the diversion structure and pump station would be moved farther away from the transmission towers.

Alternative 3 - Alternative 3 consists of a smaller subterranean infiltration gallery (72,000 sf) with an interior height of 12 feet and invert depth of approximately 19½ feet. This alternative would also include the use of 12 approximately 50-foot-deep dry wells connected to the gallery. The pump station would be removed and the catch basin at the south end of Potter Avenue would drain into a bioswale along the north boundary of the park.

Alternative 4 - Alternative 4 consists of a subterranean infiltration gallery (73,000 sf) with an interior height of 14 feet and invert depth of approximately 18 feet beneath the baseball diamonds. This alternative also includes the installation of two approximately 50-foot-deep dry wells for dry weather runoff, a diversion structure on the existing 45-inch-diameter RCP storm drain and new 36- and 42-inch-diameter pipelines with an in-line HDS unit and pump station. Additional subsurface exploration would be recommended to further evaluate Alternative 4, if chosen for the project.

3 PROJECT OBJECTIVES

Based on the requested Phase II ESA services specified in Addendum No. 5 (Appendix B), the project objective was to evaluate whether specific Constituents of Potential Concern (COPC) are

present at the site at concentrations exceeding applicable regulatory action levels. The requested SOW indicated in Addendum No. 5 did not indicate or request delineation of COPC (or wastes). Addendum No. 5 did not provide information or reference the site as being the possible location of waste disposal. However, based on our discussion with CDM Smith, we understand that the City indicated that the park may have previously been the location of a *"landfill."* The tasks indicated in Addendum No. 5 were not specific to waste disposal site characterization and delineation.

The site is not listed in the California Department of Resources, Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) database; however, many waste disposal sites statewide are not included in the database, primarily because the regulatory agencies are unaware of their existence.

4 SCOPE OF WORK

The SOW for this Phase II ESA was that specifically indicated in Addendum No. 5 and our January 23, 2020 proposal, and additional environmental assessment activities requested by CDM Smith as follows:

- **Project Familiarization and Management** – This task included project management, coordination, and a field reconnaissance to observe and document the site conditions, mark-out proposed hollow-stem auger (HSA) boring and test pit locations for underground utility clearance by Underground Service Alert (USA), and meet with Recreational and Parks personnel regarding site access and constraints. Ninyo & Moore obtained a Los Angeles County Environmental Health Department (LACEHD) permit for the borings.

- **Site Health and Safety Plan** – Ninyo & Moore prepared a worker site health and safety plan in accordance with Occupational Safety and Health Administration (OSHA) and Hazardous Waste Operation Standards 29 that was reviewed and signed by our Certified Industrial Hygienist and used in the field during the environmental assessment.

- **Geophysical Survey** – Ninyo & Moore oversaw geophysical clearance of planned exploratory locations. A description of the geophysical survey methods is presented in Section 10.3.

- **Limited Phase II ESA** – The assessment consisted of drilling, logging, sampling and performing soil gas monitoring of five HSA borings to depths of approximately 25 feet bgs.

  CDM Smith additionally requested *"a day of backhoe test pits to further evaluate the depths and limits of the landfill at Strathern Park."* The scope of work generally consisted of excavating, logging, sampling and documenting with photographs the six test pits to depths of up to approximately nine feet bgs.

- **Environmental Testing** – The analytical testing program specified in the addendum provided a list of likely analytical tests to be performed on samples consisting of total recoverable petroleum hydrocarbons (TRPH) by United States Environmental Protection Agency (EPA) method 1664, total petroleum hydrocarbons (TPH) by EPA test method 8015M, volatile organic compounds (VOCs) by EPA method 8260B, semi-volatile organic compounds (SVOCs) by EPA methods 8270C and 8270C-SIM, Title 22 metals by EPA methods 6010B/7471A, organochlorine pesticides (OCPs) and polychlorinated biphenyls (PCBs) by

EPA test methods 8081A and 8082, respectively; and chlorinated herbicides by EPA method 8151A. The analytical testing was conducted in general accordance with that indicated in the addendum.

- **Phase II ESA Report** – Performed data compilation and analysis, performed quality assurance/quality control (QA/QC) of data obtained, tabulated analytical data and compared to appropriate regulatory levels, prepared this Limited Phase II ESA report that summarizes assessment methodologies and results, findings, and provides recommendations.
- **Disposal of Investigation Derived Wastes (IDW)** – The 12 drums of IDW were characterized and Ninyo & Moore oversaw disposal to an appropriately licensed facility. Management of the IDW is presented in Section 10.10.

Additionally, on-line regulatory agency database and readily available historical aerial photographs of the site and vicinity were reviewed to evaluate whether they indicated the presence of waste disposal at the site and vicinity.

5 SITE LOCATION AND DESCRIPTION

Strathern Park North is a City of Los Angeles park located on the eastern side of the San Fernando Valley, east of California SR-170 and approximately one-mile south of Interstate 5 (I-5). The park consists of a relatively level, triangular-shaped area bounded by an LADWP transmission line (TL) easement on the southwest, residential properties to the adjacent north, Whitsett Avenue followed by residential properties to the east, and Strathern Street followed by Jamie Beth Slaven Park to the south. The site that is the subject of this Phase II ESA and the geotechnical evaluation is the generally western area of the park that consists of undeveloped land (Figures 1 through 4).

The eastern approximate half of the park (adjacent to and east of the site) is developed with four baseball fields, restroom and concession facilities an asphalt concrete (AC) parking lot, Portland cement concrete (PCC) walkways, landscaping, and other miscellaneous improvements. Based on our review of the CSR (LADWP, 2018), we understand that a 45-inch-diameter RCP storm drain is located along the east side of SR-170 and a 60-inch-diameter water pipeline traverses the LADWP TL easement. Based on our review of topographic maps (NavigateLA, 2020), the park slopes gently toward the southeast with site elevations ranging from approximately 808 feet above mean sea level (MSL) at the northwest corner of the park to approximately 800 feet (MSL) at the southeast corner.

6 ENVIRONMENTAL BACKGROUND

Background environmental information was not provided by the client and Addendum No. 5 did not provide background environmental information or specify the type of possible contamination at the site. Because the client indicated at the kickoff meeting that the site may be the location of

a *"landfill,"* the SWIS database was searched and the site was not listed as a solid waste disposal site in the database.

7 HISTORICAL AERIAL PHOTOGRAPHS

Select, readily available historical aerial photographs were reviewed of the site and vicinity from the Nationwide Environmental Title Research, LLC (NETR) online database. The purpose of the cursory review was to evaluate whether evidence of waste disposal activities has occurred at the site. The 1952 aerial photograph indicates several unpaved roads extending westerly from unpaved Whitsett Avenue and from an area to the south and terminating at two bulbous-shaped raised areas that may correspond to possible dumping/waste disposal. The disturbed areas that may be related to waste disposal generally correspond to the current baseball fields and parking areas of the park to the adjacent east of the site and a portion of the site.

The 1953 aerial photograph indicates fairly significant surface disturbances, primarily at the baseball fields and parking areas of the park to the adjacent east of the site and extending westerly onto a portion of the site. The area extending onto the site is similar in appearance to what was observed in the 1952 photograph. The disturbed surface area to the adjacent east (baseball fields and parking area for the park) are a generally rectangular-shaped area, possibly perimeter access roads. Although not known, the described features are suggestive of dumping/waste disposal. The residences to the adjacent north of the site were not present in the 1952 photographs; some were constructed by 1953. Based on our interpretation of select limited historical aerial photographs, the baseball fields and parking areas and a portion of the site were the locations of surface disturbances that may have been related to waste disposal, possibly associated with residential construction projects in the area. The aerial photographs also suggest dumping/waste materials may extend offsite, possibly underlying some adjacent residences north of the park and possibly to the south of the park. Earlier photographs were not available for the site using the online database. A copy of the 1953 aerial photograph is provided as Appendix C as Ninyo & Moore has this photograph as part of our in-house photograph collection. The 1952 aerial photograph viewed online only is copyrighted material and therefore is not provided.

8 GEOLOGIC AND SUBSURFACE CONDITIONS

Review of regional geologic maps indicate that the site is generally underlain by Holocene-age wash deposits associated with deposition along the Tujunga Wash (Campbell et al., 2014). The deposits are described as consisting of unconsolidated gravel, sand, and silt in active or recently active stream beds. The California Department of Mines and Geology (CDMG, 1997) has also

mapped the site as being underlain by wash deposits consisting of loose to medium dense, sand and silty sand with lesser quantities of silt and gravel.

During the geotechnical evaluation and the Phase II ESA, we encountered undocumented fill and alluvium to the total depths explored. Generalized descriptions of the materials encountered during our subsurface exploration are presented below. More detailed descriptions of the subsurface materials are presented on the boring logs and test pit logs included as Appendix A to this report and CPT soundings included in the geotechnical evaluation (Ninyo & Moore, 2020b).

8.1 Undocumented Fill

Undocumented fill was encountered in the borings and test pits to depths ranging from approximately 3 to 13 feet bgs. The fill generally consists of granular deposits of light brown and brown, moist, very loose to medium dense, silty sand, clayey sand, poorly graded sand with silt, poorly graded sand with clay, poorly graded sand, well-graded sand with silt, and sandy silt, and brown, moist, soft to firm, lean clay and clayey sand. The fill contains various amounts of gravel and scattered cobbles. Minor amounts of waste materials were observed within the undocumented fill at borings B-1, B-2, P-1, P-3, and P-5, and test pits TP-3 through TP-6. The observed waste materials generally consist of pieces of AC, concrete, brick, bottles glass, ceramic, plastic, and tires. Documentation regarding the limits of fill or the placement and compaction of the fill soils was not available for our review.

8.2 Alluvium

Alluvium was encountered beneath the undocumented fill, to the total depth explored of up to approximately 70½ feet. The alluvium generally consists of interbedded granular deposits of light brown and brown, moist, loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, and sandy silt. The alluvial deposits contain variable amounts of gravel and cobbles.

9 GROUNDWATER

The site lies within the Coastal Plain of Los Angeles Basin of the South Coast Hydrologic Region and is situated approximately 0.9 miles east of the Tujunga Wash (DWR, 2003). The California Division of Mines & Geology (CDMG, 1997) indicates that the historic high depth to groundwater at the site ranges from approximately 110 to 120 feet bgs. Ninyo & Moore reviewed available information pertaining to groundwater in the site vicinity on the State Water Resources Control Board (SWRCB) GeoTracker website. Based on the website, it appears that the closest site with available groundwater depth information is approximately 0.5 miles to the northwest, at 12858 Roscoe Boulevard. According to an Additional Site Assessment Report dated July 13, 2012, for

this site (Shell Service Station) prepared by Wayne Perry Inc., (Wayne Perry Inc., 2012), groundwater was encountered at a depth of approximately 130 feet bgs in soil boring B-7 at the property in July 2010. In May 2012, a groundwater monitoring well was drilled and it was reported, *"Depth to first saturation in the boring was observed at approximately 194 feet, however the well was dry on June 4 and 14, 2012."* The depth to groundwater in a Los Angeles County groundwater monitoring well (Well ID 4898) located 800 feet southeast of the site was approximately 307 feet in 2009 (the latest posted measurement) (COLA, 2020). The depth to groundwater in this well ranged from approximately 204 and 335 feet from 1975 to 2009. It is anticipated that the current depth to groundwater at the park is similar to the groundwater depth information provided in this report section.

According to the Upper Los Angeles River Area Watermaster Groundwater Pumping and Spreading Plan 2002-2007 Water Years, groundwater in the site vicinity is reported to flow south, following regional topography (ULARAW, 2003).

During the subject Phase II ESA and geotechnical evaluation, groundwater was not encountered in borings to depths of 71 feet bgs during drilling or during the percolation testing that included leaving borings open for 47 days. Groundwater levels, gradient, and flow direction can fluctuate due to seasonal variations, groundwater withdrawal or injection, changes in land use, and other factors.

10 LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT

The following sections describe environmental activities that were conducted at the site for this Limited Phase II ESA as requested in Addendum No. 5 and our proposal (Ninyo & Moore, 2020a). The Phase II ESA was conducted concurrently with the geotechnical evaluation and as possible, exploratory locations combined geotechnical and environmental activities to maximize the information obtained for the project. The Limited Phase II ESA was conducted under the direction of a Ninyo & Moore California-Licensed Professional Geologist (PG).

The subsurface environmental assessment generally included the following:

- Drilling, sampling and logging five HSA borings (B-1, B-3, P-2, P-4, and P-6).
- Conducting soil gas field screening in each boring.
- Conducting shallow soil sampling by advancing eight shallow hand auger borings to collect samples at a depth of approximately 1-foot bgs (COMP-1 to COMP-8) for one composite sample analysis.
- Observing subsurface conditions in the six exploratory test pits.

The geotechnical evaluation included excavating six exploratory test pits, drilling additional borings and conducting six Cone Penetration Test (CPT) soundings. The approximate locations of the environmental and geotechnical borings, test pits, CPT soundings, and shallow soil sampling are presented in Figure 4. Global Positioning system (GPS) coordinates for each environmental sampling location are presented in Table 1. Boring and test pit logs accompanied by photographs of the field work are presented in Appendix A.

10.1 Permits and Notifications

Prior to implementing field activities, Ninyo & Moore obtained a well permit for fifteen borings from the Los Angeles County Department of Environmental Health (LACDEH). The permit was for three borings, six percolation test borings, and six CPT borings, for a total of 15 borings. Five of the 15 borings were specifically requested in Addendum No. 5 for the Phase II ESA and included environmental analysis, while the remaining permitted borings were related to the geotechnical evaluation. A copy of the permit is included as Appendix D. Permits were not required for the six exploratory test pits.

The City Addendum No. 5 did not provide information about the site history or that the site may be the location of a *"landfill"* or waste disposal site. However, after the project was awarded, the client indicated that the site was possibly the location of a *"landfill"* based on information from the City. The City of Los Angeles, Solid Waste Local Enforcement Agency (LEA) must be notified of subsurface activities at locations known (or suspected) to be waste disposal sites whether they are, or are not, listed in the CalRecycle SWIS database. Additional information related to LEA notification requirements are provided in the conclusions and recommendations section of this report. The client and LABOE were notified of the planned field work shortly after the schedule was established.

10.2 Site Health and Safety Plan

Prior to implementing the field activities, a worker Site Health and Safety Plan (SHSP) was prepared in general accordance with OSHA Hazardous Waste Operation Standards 29 Code of Federal Regulations (CFR) 1910.120. The plan was reviewed and approved by a certified industrial hygienist.

The SHSP provided worker site health and safety information and requirements based on the SOW specified in Addendum No. 5 and suspected COPCs that may be present at the site according to laboratory analysis specified in the addendum. Prior to the initiation of field activities, a site safety briefing was conducted to evaluate potential physical and chemical hazards and outline measures to be taken in the event of an emergency. On-site personnel signed the safety

form acknowledging their participation in the briefing. No health and safety emergencies related to fieldwork occurred during this assessment.

10.3 Underground Service Alert (USA) and Geophysical Clearance of Exploration Locations

Prior to conducting field activities, the proposed boring locations were marked with white spray paint or a pin flag was placed in the proposed location. USA of Southern California was notified of the intent to conduct the subsurface evaluation activities at least 72 hours prior to initiation of intrusive field tasks. An Inquiry identification number was obtained for the boring locations (A200650823).

On March 23, 2020, Spectrum Geophysics conducted a geophysical clearance of the proposed boring and test pit locations using a Vivax Proloc2 electromagnetic (EM) utility locator, Sensors and Software 500 megahertz (MHz) ground penetrating radar, Fisher TW-6 MSCOPE EM Induction, Radiodetection RD 4000 EM utility locator and a 3M Dynatel 500A EM utility locator for the purpose of locating potential underground utilities or obstructions to planned drilling and test pit excavation activities. An anomaly of unknown source was located within two feet of planned boring location P-6, which as a result, the planned boring was moved approximately 4 feet to the west. Additional anomalies at proposed exploratory locations were not encountered.

10.4 Drilling and Sampling

On March 24 and 25, 2020, Baja Exploration, a C-57 licensed drilling company, drilled five borings (B-1, B-3, P-2, P-4, and P-6) under the oversight of Ninyo & Moore staff and under the direction of a California-licensed PG. Boring locations were selected collectively by Ninyo & Moore and the client based on the proposed layout of the Conceptual Infiltration Basin (CIB) footprint at that time and communication with the LABOE. Drilling procedures, sample collection and depths, and QA/QC procedures were in general accordance with Addendum No. 5 and the *"Interim Guidance for Active Soil Gas Investigations"* by the Los Angeles Regional Water Quality Control Board. As specifically requested in the SOW, the five borings were sampled at depths of approximately 1, 2.5, 5, 10, 15, 20, and 25 feet bgs.

Each boring was initially hand-augured to approximately 5 feet bgs, then drilling continued using a CME 85 drill rig with nominal 8-inch, hollow stem augers. Borings B-1 and B-3 were drilled to depths of approximately 25 feet bgs. Percolation test/environmental borings P-2, P-4, and P-6 were initially drilled to depths of approximately 25 feet bgs for the Phase II ESA and drilling was continued to depths of approximately 70.5 feet bgs to facilitate the geotechnical evaluation (percolation testing).

Soil samples collected at depths of 1 and 2.5 feet bgs for analytical testing were deposited from the auger into new laboratory supplied 8-ounce glass jars. The sample jars were immediately labelled with the sample number, depth, date, and time of sample collection. Samples collected at depths of five feet or deeper were obtained using the hollow-stem split spoon sampler which was driven using a 140-pound hammer (approximate weight) dropping approximately 30 inches. Samples were collected (at each sample interval) into three new 6-inch long, 2-inch diameter stainless steel or brass, sampling tubes inside the split spoon sampler. Upon retrieving the sampler from the borehole, the least disturbed sample was covered on both ends by Teflon™ sheeting, sealed with plastic end caps, labeled and placed into a cooler with ice.

One sample from each of the hollow stem auger borings was collected for VOCs analysis in accordance with EPA Method 5035 and following the Department of Toxic Substances Control (DTSC) Method 5035 Guidance Document, dated November, 2004 (DTSC, 2004). The VOC sample was collected at depths ranging from 5 to 20 feet bgs, corresponding to the highest photoionization detector (PID) reading in that boring.

After drilling, the five borings were backfilled in general accordance with the LACDEH permit and California Well Standards 74-90 requirements using a cement grout mix ratio of approximately 5-6 gallons of water per 94-pound bag of Portland cement where up to 6% bentonite was added to the cement-based mix. The borings were backfilled with the cement-based mix to approximately one-foot bgs and topped with soil to generally match the surrounding area. Latitude and longitude measurements of the environmental borings were recorded for later reference.

The sample containers were labeled, placed in a cooler containing ice, and transported following standard chain-of-custody (COC) protocols to Enthalpy Analytical (Enthalpy), a state-certified laboratory, for analytical testing within 24 hours after their collection.

10.5 Exploratory Test Pits

Initially the focus of the exploratory test pits was related to evaluating waste materials. However, as the project progressed, the test pits were primarily excavated to evaluate subsurface materials for geotechnical design purposes. Please refer to the geotechnical report for information about the test pits and findings. Test pit logs and photographs are included in Appendix A.

10.6 Duplicate Sample Field Screening

During drilling activities, *a "duplicate sample"* from each sampling depth was placed into a Ziploc® baggy, sat in available sunlight for at least ten minutes, then the headspace in the baggy was measured for VOCs using a hexane-calibrated PID. The boring logs in Appendix A include the PID readings.

10.7 Soil Gas Screening

Oxygen (O_2), carbon monoxide (CO), hydrogen sulfide (H_2S), and methane as lower explosive limit (LEL) were measured in air in each of the five environmental boreholes during drilling at depths of approximately 5, 10, 15, 20, and 25 feet bgs. After advancing the drill bit, readings of the air in the borehole were obtained for O_2, CO, H_2S, and LEL by attaching a calibrated 4-gas meter with built in airflow pump to ¼-inch diameter Nylaflow® tubing.

The Nylaflow® tubing was lowered into each borehole immediately after the air monitoring depth was reached. The 4-gas meter pump was allowed to flow for approximately two minutes at each depth to allow the purge of gas present in the tubing before recording gas measurements at the surface from each sampling depth. Soil vapor field screening results are included on the boring logs in Appendix A.

10.8 Shallow Soil Sampling

As specified in the Addendum No. 5, shallow soil samples were collected from eight on-site locations and included two samples from planters located at the eastern perimeter of the site and the remainder of the samples at locations to obtain site coverage. In general, the samples were collected at the site perimeter and center (Figure 4).

The samples were collected at depths of approximately one-foot bgs and as requested in the addendum, were composited at the analytical testing laboratory for one analysis. Samples were collected using hand auger equipment and the samples were transferred from the auger into clean, laboratory–supplied, glass jars. The samples were immediately labeled and chain of custody procedures were followed as described for the boring samples.

10.9 Decontamination Procedures

Equipment coming into contact with potentially contaminated soil or waste materials was decontaminated to prevent potential cross contamination between samples collected from the hollow stem and hand auger borings and to assure the quality of samples collected.

10.10 Investigation Derived Wastes (IDW)

After drilling, the areas investigated were left in an orderly condition with equipment, unused materials, and other miscellaneous items resulting from, or used in, the assessment removed from the site. Drill cuttings and decontamination water from the investigation was temporarily stored on site in 12 Department of Transportation-approved 55-gallon drums. The drums were labeled with generator information including: site name and address, generator name and phone number, contents, date of accumulation, and hazardous waste classification. Other IDW was collected into trash bags and disposed as typical non-hazardous waste.

Two composite samples were collected from the drums for waste profile analytical testing of the IDW as requested by Belshire Environmental Services, Inc. (Belshire), a California-licensed waste hauler. Based on the analytical results of the waste drum samples, the cuttings generated from the 15 borings (environmental and geotechnical) were classified as non-hazardous.

On May 6, 2020, 12 drums were picked up by Belshire and transported and disposed of at Soil Safe in Adelanto, California. A copy of the uniform non-hazardous waste form and data and certification sheets are provided in Appendix E.

11 ANALYTICAL TESTING

The analytical testing program included those analyses indicated as likely to be conducted as specified in Addendum No. 5. Boring samples selected for VOC analytical testing were based on the highest PID reading from each environmental boring, for a total of five samples. Other boring samples analyzed were generally selected based on obtaining adequate site coverage and analytical data from various depths. Select samples were analyzed from the borings and the shallow composite sample, COMPOSITE 1-8 for the following Constituents of Potential Concern as summarized in the following table.

Summary of Analytical Testing

Constituents of Potential Concern	EPA Test Method	Number of Samples Analyzed
Title 22 Metals	6010B/7471A	12
Organochlorine Pesticides (OCPs)	8081A	6
Polychlorinated Biphenyls (PCBs)	8082	6
Chlorinated Herbicides (CHs)	8151A	6
Total Oil and Grease in Solids (Total Recoverable Petroleum Hydrocarbons (TRPH))	1664A M	17
Total Petroleum Hydrocarbons (TPH)	8015B	6
Volatile Organic Compounds (VOCs)	8260B/5035	6
Semi-Volatile Organic Compounds (SVOCs)	8270C	6
Polynuclear Aromatic Hydrocarbons (PAHs)	8270C-SIM	2

Analytical testing was conducted by Enthalpy with the exception of the chlorinated herbicide analyses which were conducted by American Environmental Testing (AETL), as a subcontractor to Enthalpy. AETL is also a state certified analytical testing laboratory.

12 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

The laboratory analytical reports were reviewed as part of the QA/QC protocol. Enthalpy indicated that samples they received were in a cold and intact condition and were analyzed within their respective holding times. The Enthalpy laboratory reports contained case narratives regarding quality control results for the analyzed samples and the reader is referred to the analytical reports

included in Appendix F for specific information. Based on review of the analytical reports and conversation with the analytical testing laboratory, the data qualifiers do not affect the quality of the analytical data.

Field equipment used for air monitoring was calibrated by the equipment rental company prior to delivery to Ninyo & Moore. In addition, Ninyo & Moore field staff calibrated the equipment each field work day.

13 ANALYTICAL TESTING RESULTS

Analytical results are summarized in Tables 2, 3 and 4, and discussed in this section. Laboratory analytical reports are provided in Appendix F. Based on the planned construction project, it is anticipated that the project will require the excavation and removal of the subsurface waste materials encountered during this assessment and soils. Currently the locations and depths of wastes are not entirely known and the removal depths of the construction project have not yet been determined. However, based on the anticipated removal of subsurface materials which are anticipated to include wastes, the analytical results were compared to hazardous waste criteria in lieu of residential screening values as indicated in the proposal.

13.1 Title 22 Metals

Arsenic, barium, cadmium, chromium, cobalt, copper, molybdenum, nickel, vanadium, and zinc were detected in the 12 samples analyzed including the composite sample and thallium was detected in one sample from a boring. The concentrations of these metals in the samples analyzed were less than their respective Total Threshold Limit Concentrations (TTLC) and less than ten times their respective Soluble Threshold Limit Concentrations (STLC) (Table 2).

Lead was detected in 12 samples including the composite sample at concentrations ranging from 3.0 to 94 mg/kg. Three of these samples, B-1-2.5', B-3-1', and B-3-2.5' contain lead at concentrations of 72, 51 and 94 mg/kg, respectively. These concentrations are less than the lead TTLC of 1,000 mg/kg; however, these concentrations exceed 10 times the lead STLC of 50 mg/kg. Based on this, the samples were additionally analyzed for soluble lead by the waste extraction test (WET) method. Soluble lead concentrations ranged from 1.1 milligrams/liter (mg/l) to 1.4 mg/l and were less than the lead STLC of 5.0 mg/l threshold criteria.

13.2 Organochlorine Pesticides (OCPs)

4,4'-DDE and 4,4'-DDT were detected in one of the five samples analyzed, B-1-1', at concentrations of 250 micrograms per kilogram (µg/kg) and 90 ug/kg, respectively, and 4,4'-DDE was detected in the composite sample (COMPOSITE 1-8) at a concentration of 45 µg/kg. These

concentrations are less than the TTLC of 1.0 mg/kg threshold criteria. Other OCPs were not detected at concentrations greater than their respective LRLs in the samples analyzed (Table 3).

13.3 Polychlorinated Biphenyls (PCBs)

Aroclor 1254 was detected in one of the five samples analyzed, B-3-1', at a concentration of 1,100 µg/kg, significantly less than the TTLC of 50,000 µg/kg threshold criteria. Other PCBs were not detected at concentrations greater than their respective LRLs in the samples analyzed (Table 3).

13.4 Total Petroleum Hydrocarbons (TPH)

TPH as carbon chain C_{23}-C_{44} was detected in four of the five samples and the composite sample at concentrations ranging from 14 mg/kg in samples B-3-20' and P-2-15' to 52 mg/kg in sample P-6-15'. TTLC or STLC threshold criteria have not been established for TPH. TPH was not detected at a concentration greater than the LRL in the other sample analyzed (Table 4).

13.5 Semi-Volatile Organic Compounds (SVOCs)

Bis(2-ethylhexyl)-phthalate, fluoranthene, and pyrene were detected at concentrations of 260, 250, and 260 µg/kg, respectively, in sample B-1-5'. TTLC or STLC threshold criteria have not been established for these analytes. Other SVOCs were not detected at concentrations exceeding their respective LRLs in the samples analyzed (Table 4).

13.6 Volatile Organic Compounds (VOCs), Polynuclear Aromatic Hydrocarbons (PAHs), Chlorinated Herbicides (CHs) and Total Recoverable Petroleum Hydrocarbons (TRPH)

Concentrations of VOCs, PAHs, CHs, and TRPH were not detected above their respective LRLs in the samples analyzed (Tables 3 and 4).

14 SUMMARY OF FINDINGS

Based on the results of this Limited Phase II ESA, the following findings are provided at this time:

- Waste materials were encountered in six borings, B-1, B-2, P-1, P-3, P-4, and P-5 and four test pits TP-3, TP-4, TP-5 and TP-6 (Appendix A). At the locations explored, the waste materials generally were observed to consist of primarily construction debris (AC, concrete, brick); lesser amounts of plastic, glass, ceramic debris; bottles; and tires at depths of approximately 0.5 to 13 feet bgs (boring B-1). Waste materials were observed to extend to a depth greater than could be excavated (due to caving), approximately nine feet bgs in test pit TP6. At locations explored, the waste materials appear to be generally covered with approximately 0.5 to 2 feet of fill soil.
- The depth of waste materials at the site was not delineated and waste materials extend laterally outward from locations explored during this environmental assessment. Waste

materials delineation was not an objective of this limited assessment. Locations where waste materials were observed at the site are summarized on Figure 4.

- Prior to conducting the environmental assessment, there was mention that the park, or a portion, was the location of a *"landfill."* It is not known at this time whether there is background information available about waste disposal at the site.

- A cursory review of readily available historical aerial photographs shows surface disturbances at the site, other areas of the park and possibly outlying the park that may be interpreted to be related to waste disposal. These areas appear to be generally consistent with results of this environmental assessment (e.g., presence of wastes at the site).

- The waste disposal site is not listed in the online CalRecycle SWIS database meaning that it is not a known and/or documented waste disposal site. There are numerous undocumented waste disposal sites similar to this site, statewide and it has been our experience that parks are often previous locations of waste disposal sites. The park (or a portion of the park) and possibly other locations extending offsite, including residential properties, may be the location of an undocumented, pre-regulations waste disposal site.

14.1 Analytical Results

Analytical results were compared to hazardous waste criteria based on the planned construction project that will include removal of subsurface materials, including waste materials. The following summarizes the analytical results based on the samples analyzed. It should be noted that the sampling locations/depths are generally inconsistent with Phase II ESAs conducted at waste disposal sites which generally include sampling the waste cover (if present), wastes materials, as possible (or surrounding soils), and formation (alluvium) underlying the waste materials. In addition, the analytical testing program included some tests (e.g., TRPH) typically not conducted at waste disposal sites.

Title 22 Metals

Metal concentrations in samples analyzed did not exceed their respective TTLC values. Lead was the only metal with total concentrations in three samples that exceed 10 times the lead STLC. Additional WET (soluble) testing of these samples indicated concentrations less than the lead STLC of 5.0 mg/l. Based on this, metal concentrations in the samples analyzed are less than their respective hazardous waste criteria.

Organochlorine Pesticides

4,4'-DDE and 4,4'-DDT was detected at concentrations of 250 and 90 ug/kg, respectively, in one of the five boring samples and 4,4'-DDE was detected at a concentration of 45 µg/kg in the composite sample. These concentrations are less than their hazardous waste criteria.

Polychlorinated Biphenyls

Aroclor 1254 was detected in one of the five boring samples at a concentration of 1,100 µg/kg which is less than the hazardous waste criteria.

Semi-Volatile Organic Compounds (SVOCs)

Bis(2-ethylhexyl)-phthalate, fluoranthene, and pyrene were detected in one sample. TTLC or STLC threshold criteria have not been established for these analytes.

Total Petroleum Hydrocarbons

Relatively low concentrations of diesel and motor oil range TPH (C_{23}-C_{44}) were detected in four of the five boring samples and the composite sample at concentrations ranging from 14 to 52 mg/kg. TTLC or STLC threshold criteria have not been established for TPH.

Total Recoverable Petroleum Hydrocarbons, Polynuclear Aromatic Hydrocarbons, Chlorinated Herbicides and Volatile Organic Compounds

TRPH, PAHs, CHs and VOCs were not detected above their respective LRLs in the samples analyzed.

14.2 Duplicate and Field Screening

Field screening of the duplicate samples for soil vapor generally indicated low organic vapor readings.

H2S was not measured above zero parts per million (ppm) and methane was not measured above zero percent of the LEL during field screening in the five hollow stem auger borings. Carbon monoxide (CO) readings ranged from zero to 14 ppm. The highest CO readings were in boring B-3 and ranged from 10 to 14 ppm at 15 to 25 feet bgs. O2 readings ranged from 17.5 to 20.9%. The lowest oxygen levels were in boring B-1, which ranged from 17.5 to 17.8% volume from approximately 15 to 25 feet bgs.

15 RECOMMENDATIONS

Based on the Limited Phase II ESA, the following recommendations are provided at this time:

- Because waste materials were encountered at the site (portion of the park), the LEA should be notified and a copy of this report submitted for their review and comments. Other regulatory agencies may also require notifications.
- CCR Title 27, Section 21190, indicates that when there is a change in post-closure land use at a (known or previously unknown) waste disposal site, the LEA should be notified and a post closure land use plan (PCLUP) be prepared and submitted to the LEA for review, comment and approval.
- Based on our past experience on similar projects, we anticipate that the LEA will require additional environmental site assessment of the waste materials. The additional evaluation may include:
    - Conducting a limited historical study consisting of obtaining and reviewing available historical documents, including historical aerial photographs and readily available background documents/reports for the site, to evaluate the waste disposal history, disposal methods, the lateral extent of waste materials as much as possible and to assist with preparing a Phase II ESA work plan. It is possible that there is only minimal background information available about the waste disposal site/area since it was not a regulated site; however, geotechnical reports, grading plans and other documents not directly related to waste disposal may be available. It may also be worthwhile interviewing nearby residents, particularly those located adjacent to the park. This anticipated scope of work can be incorporated into the work plan (see next bullet).

- Prepare and submit a work plan for approval by the LEA and possibly also CalRecycle, and other appropriate regulatory agencies, as necessary, to perform an additional Phase II ESA at the park focused on characterizing and delineating the extent of the waste materials. The LEA will likely require the waste materials be delineated at the park (same ownership) as opposed to only the site (portion of the park); and therefore, the additional Phase II ESA may extend beyond the site that was the subject of this environmental assessment.

- Perform an additional Phase II ESA at the site consistent with conducting waste disposal site assessments which may consist of a geophysical survey and excavating and sampling exploratory test pits, and borings at locations that cannot be evaluated with test pits (recently paved parking lot, baseball fields, etc.). The purpose would be to further characterize and delineate the vertical and lateral extent of waste materials at the park; evaluate the presence and thickness of final cover, as applicable; and whether the waste materials have impacted the underlying and/or adjacent soils.

- Prepare a Phase II ESA report for submittal by LABOE to the LEA, and possibly CalRecycle, and other appropriate regulatory agencies for their review and approval. To expedite the project, improve efficiency, and realize cost savings, it may be possible to include the Phase II ESA report in the PCLUP (see next bullet).

- Prepare a PCLUP for submittal by LABOE to the LEA, and possibly CalRecycle, and other appropriate regulatory agencies to include the results of the additional Phase II ESA, and information about the planned post-closure land use(s) (e.g., planned construction project). The proposed post closure land use(s) will need to be approved by the LEA and possibly CalRecycle and other regulatory agencies.

16 LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past on-site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

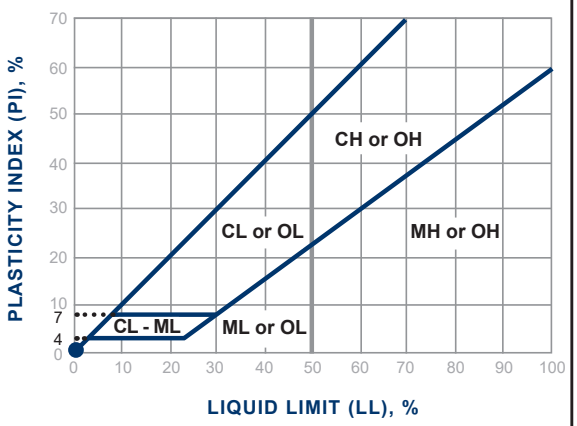
Boring Logs, Test Pit Logs, and Photographs

Boring Logs



Soil Classification Chart Per ASTM D 2488

Primary Divisions			Secondary Divisions	
			Group Symbol	Group Name
COARSE-GRAINED SOILS more than 50% retained on No. 200 sieve	**GRAVEL** more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly graded GRAVEL
		GRAVEL with DUAL CLASSIFICATIONS 5% to 12% fines	GW-GM	well-graded GRAVEL with silt
			GP-GM	poorly graded GRAVEL with silt
			GW-GC	well-graded GRAVEL with clay
			GP-GC	poorly graded GRAVEL with
		GRAVEL with FINES more than 12% fines	GM	silty GRAVEL
			GC	clayey GRAVEL
			GC-GM	silty, clayey GRAVEL
	SAND 50% or more of coarse fraction passes No. 4 sieve	CLEAN SAND less than 5% fines	SW	well-graded SAND
			SP	poorly graded SAND
		SAND with DUAL CLASSIFICATIONS 5% to 12% fines	SW-SM	well-graded SAND with silt
			SP-SM	poorly graded SAND with silt
			SW-SC	well-graded SAND with clay
			SP-SC	poorly graded SAND with clay
		SAND with FINES more than 12% fines	SM	silty SAND
			SC	clayey SAND
			SC-SM	silty, clayey SAND
FINE-GRAINED SOILS 50% or more passes No. 200 sieve	**SILT and CLAY** liquid limit less than 50%	INORGANIC	CL	lean CLAY
			ML	SILT
			CL-ML	silty CLAY
		ORGANIC	OL (PI > 4)	organic CLAY
			OL (PI < 4)	organic SILT
	SILT and CLAY liquid limit 50% or more	INORGANIC	CH	fat CLAY
			MH	elastic SILT
		ORGANIC	OH (plots on or above "A"-line)	organic CLAY
			OH (plots below "A"-line)	organic SILT
	Highly Organic Soils		PT	Peat

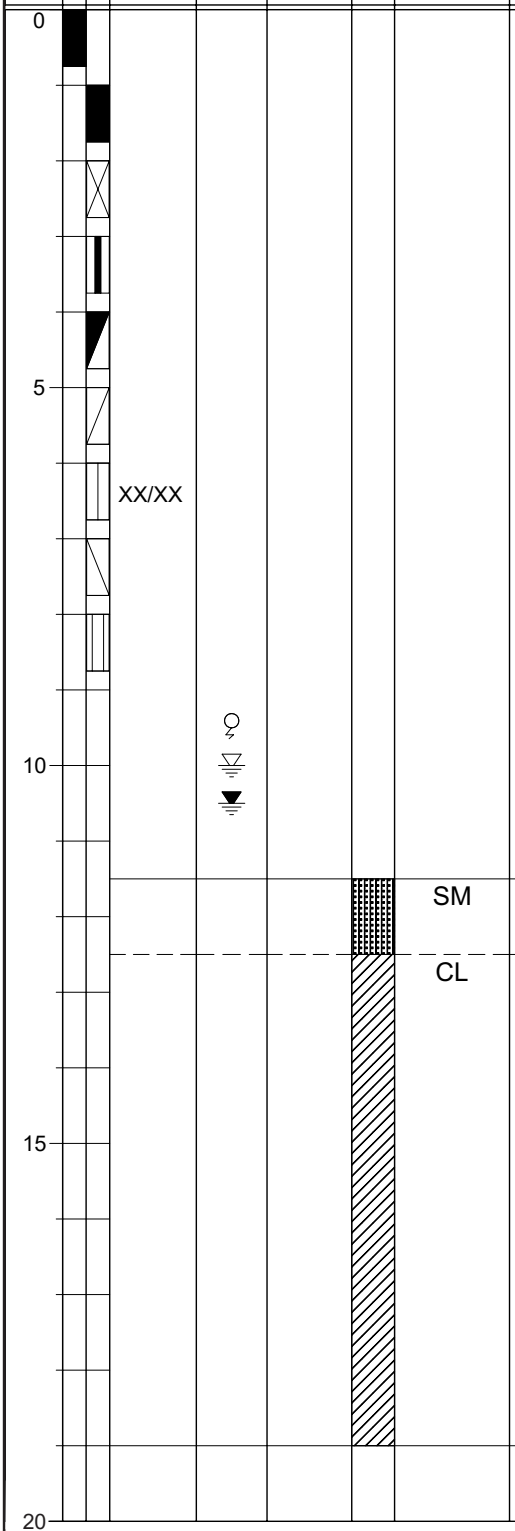
Grain Size

Description		Sieve Size	Grain Size	Approximate Size
Boulders		> 12"	> 12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	Fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10 - #4	0.079 - 0.19"	Rock-salt-sized to pea-sized
	Medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock-salt-sized
	Fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	< 0.0029"	Flour-sized and smaller

Plasticity Chart

Apparent Density - Coarse-Grained Soil

Apparent Density	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)
Very Loose	≤ 4	≤ 8	≤ 3	≤ 5
Loose	5 - 10	9 - 21	4 - 7	6 - 14
Medium Dense	11 - 30	22 - 63	8 - 20	15 - 42
Dense	31 - 50	64 - 105	21 - 33	43 - 70
Very Dense	> 50	> 105	> 33	> 70



Consistency - Fine-Grained Soil

Consis-tency	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)
Very Soft	< 2	< 3	< 1	< 2
Soft	2 - 4	3 - 5	1 - 3	2 - 3
Firm	5 - 8	6 - 10	4 - 5	4 - 6
Stiff	9 - 15	11 - 20	6 - 10	7 - 13
Very Stiff	16 - 30	21 - 39	11 - 20	14 - 26
Hard	> 30	> 39	> 20	> 26

USCS METHOD OF SOIL CLASSIFICATION

BORING LOG EXPLANATION SHEET

Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

MAJOR MATERIAL TYPE (SOIL):

Solid line denotes unit change.

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

DATE DRILLED 3/25/2020 BORING NO. B-1

GROUND ELEVATION 810' ± (MSL) SHEET 1 OF 1

METHOD OF DRILLING 8" Hollow-Stem Auger (Baja Exploration)

DRIVE WEIGHT 140 lbs. (Auto. Trip Hammer) DROP 30"

SAMPLED BY KMH LOGGED BY KMB REVIEWED BY GMC

DEPTH (feet)	SAMPLES (Bulk / Driven)	BLOWS/FOOT	MOISTURE (%)	DRY DENSITY (PCF)	PID READING (PPM)	SYMBOL	CLASSIFICATION U.S.C.S.	DESCRIPTION/INTERPRETATION
0					3.4		SC	FILL: Brown, moist, loose, clayey SAND; trace gravel and organic material.
					3.1		SM	FILL AND MINOR WASTES: Brown, moist, loose, silty SAND with gravel; few pieces of asphalt concrete.
		11	10.1	97.9	5.7			@ 5': LEL - 0%; O_2 - 20.5%, CO - 7 ppm, H_2S - 0.0 ppm

Soil Classification Chart Per ASTM D 2488

Primary Divisions			Secondary Divisions	
			Group Symbol	Group Name
COARSE-GRAINED SOILS more than 50% retained on No. 200 sieve	**GRAVEL** more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly graded GRAVEL
		GRAVEL with DUAL CLASSIFICATIONS 5% to 12% fines	GW-GM	well-graded GRAVEL with silt
			GP-GM	poorly graded GRAVEL with silt
			GW-GC	well-graded GRAVEL with clay
			GP-GC	poorly graded GRAVEL with
		GRAVEL with FINES more than 12% fines	GM	silty GRAVEL
			GC	clayey GRAVEL
			GC-GM	silty, clayey GRAVEL
	SAND 50% or more of coarse fraction passes No. 4 sieve	CLEAN SAND less than 5% fines	SW	well-graded SAND
			SP	poorly graded SAND
		SAND with DUAL CLASSIFICATIONS 5% to 12% fines	SW-SM	well-graded SAND with silt
			SP-SM	poorly graded SAND with silt
			SW-SC	well-graded SAND with clay
			SP-SC	poorly graded SAND with clay
		SAND with FINES more than 12% fines	SM	silty SAND
			SC	clayey SAND
			SC-SM	silty, clayey SAND
FINE-GRAINED SOILS 50% or more passes No. 200 sieve	**SILT and CLAY** liquid limit less than 50%	INORGANIC	CL	lean CLAY
			ML	SILT
			CL-ML	silty CLAY
		ORGANIC	OL (PI > 4)	organic CLAY
			OL (PI < 4)	organic SILT
	SILT and CLAY liquid limit 50% or more	INORGANIC	CH	fat CLAY
			MH	elastic SILT
		ORGANIC	OH (plots on or above "A"-line)	organic CLAY
			OH (plots below "A"-line)	organic SILT
	Highly Organic Soils		PT	Peat

Grain Size

Description		Sieve Size	Grain Size	Approximate Size
Boulders		> 12"	> 12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	Fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10 - #4	0.079 - 0.19"	Rock-salt-sized to pea-sized
	Medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock-salt-sized
	Fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	< 0.0029"	Flour-sized and smaller

Plasticity Chart

Apparent Density - Coarse-Grained Soil

Apparent Density	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)
Very Loose	≤ 4	≤ 8	≤ 3	≤ 5

ADDENDUM NO. 5
August 2, 2019

ENGINEERING
CITY OF LOS ANGELES
GARY LEE MOORE, PE, ENV SP
CITY ENGINEER

Stormwater Capture Parks Program
Pre-Design and Design Services

Task Order Solicitation (TOS) No. 25

This addendum consists of this 10-page transmittal.

I. MODIFICATIONS TO THE TOS

Respondents are hereby notified to add the following services to Section 3.2.1 of TOS 25 for the Strathern Park North project only:

The Strathern Park North project will include the following services which will be performed within the proposed BMP footprint identified in the Concept Report:

PHASE II ASSESSMENT

Task 1 – Project Familiarization and Project Management

A representative of the Consultant will be requested to attend a site walk with the City to mark boring locations with white paint or stakes and become familiar with site features, utilities, site traffic and parking issues. Boring locations will be identified then.

The Consultant will be responsible for notifying Underground Service Alert (USA) for utility marking a minimum of 48 hours before any excavations. The Consultant shall assume all responsibility, including repair and other costs, for damaging any underground utilities where they are marked at the surface prior to excavations. In addition, any structures and fencing damaged during site operations shall be repaired or replaced by the Consultant at no cost to the City.

The City will obtain a ROE form from the site owner before the start of work.

The selected Consultant shall provide traffic control for drilling, sampling and geophysical activities described below. This will most likely involve traffic cones and caution tape around the work areas; Caltrans may have more specific requirements.

For the purpose of this proposal, assume that all borings will be located in unpaved areas. Old pipelines, trenches, capped oil wells and vent lines may be present. Excavations must be covered or closed daily before leaving the site to keep nearby residents safe.

Stormwater Capture Parks Program
Pre-Design and Design Services

Task Order Solicitation (TOS) No. 25

Task 2 - Health & Safety Plan

The consultant shall prepare a site-specific Health & Safety Plan for this project, appropriate for drilling and sampling in commercial/industrial airport areas where crude oil, waste oil, fuel hydrocarbons, solvents, VOCs, PAHs and heavy metals may be anticipated in soil. Old concrete may contain asbestos. There exists the possibility of lead and asbestos in remaining structures. Methane, hydrogen sulfide, and carbon dioxide gasses and oxygen deficiency may be expected in all excavations. The Health & Safety Plan shall be in effect for all field work before drilling operations commence. The plan shall specify levels of contaminants that will require drill site personnel to wear protective gear and types of personal protective equipment which will be on-site at all times to prevent health-significant inhalation or dermal exposure to hydrocarbons or metals for the workers and neighbors. There will be appropriate measures to control dust, odors or vapors from leaving the site.

Employees and subcontractors who are managing sampling, drill cuttings or related disposals shall be licensed for hazardous material handling and the workers shall have sufficient health and safety training. The latter shall be in accordance with OSHA Hazardous Waste Operation Standards 29 CFR 1910.120. The consultant shall appoint a site safety officer and a copy of the site-specific Health and Safety Plan shall be kept at the site.

Task 3 - Geophysical Survey

Perform a surficial geophysical survey of the entire level portion of the site to detect buried USTs, vaults, pipelines, etc. which may require further investigation or affect excavation of foundations and utility trenches.

Task 4 - Site Assessment Exploratory Sampling

Budget for five (5) 25-foot deep soil borings to be drilled using a conventional 8- to 10-inch diameter hollow stem auger. Hand auger the upper 5 feet to help locate unmarked utilities. The locations of the borings will be provided by BOE in consultation with the Consultant using results from Task 2. The Consultant will arrange for Underground Service Alert clearance and will assume responsibility for damaging underground utilities where they are marked at the surface prior to drilling. Any utilities, fences or pavement damaged during drilling shall be repaired or replaced.

Also required are:

- Steam cleaning of the augers between borings
- Sampling with a clean split spoon or Shelby-type samplers lined with clean acetate liners or brass tubes
- Sealing, labeling and bagging of samples and placing in an iced cooler per current State of California site assessment method guidelines
- One sample from each boring shall be collected using EPA Method 5035 "encore" or equivalent sampling device for VOCs. The sample shall be collected at the depth displaying highest screening OVA/PID reading. If there are no significant OVA/PID readings, then any depth above groundwater displaying visible staining or an odor can be used.

Duplicate samples shall be collected from each sampling point. One of the undisturbed samples shall be place on ice and transported under chain of custody protocol to a State-certified environmental laboratory within 24 hours. The duplicate sample shall be placed in a new plastic zip-lock bag in a warm area for approximately 10 minutes for headspace measurements of VOCs. Measurements will be made with an organic vapor analyzer (OVA) equipped with a flame ionization detector (FID) or photo ionization detector (PID) that has been calibrated to factory specifications within the last 3 months of testing and recalibrated periodically with reference gas. Air in the bore holes shall also be sampled with clean plastic tubing and tested every 5 feet, until total depth or groundwater is reached, for methane, oxygen and hydrogen sulfide. A manual or electric air pump can be used to pull up the sample gas from depth and to clear out the tubing, which is connected to an LEL/H2S meter.

Borings in contaminated soil which are drilling through an aquitard (a clay layer greater than 5 feet thick) shall be halted until the Consultant's geologist and BOE confer. Vertical spreading of contamination shall be prevented. Groundwater wells will likely not be installed in borings with high pressure gas or if the borings exhibit free floating product.

All drill cuttings and rinse water from borings shall be placed in labeled steel drums and stored in a protected area of the site away from drainage areas and heavy traffic. Following laboratory analysis of the material, the cuttings or water shall be disposed of as described below.

Stormwater Capture Parks Program
Pre-Design and Design Services

Task Order Solicitation (TOS) No. 25

The borings will be logged and sampled under the direct supervision of a California Professional Geologist, a Certified Hydrogeologist or a Certified Engineering Geologist. The borings shall be annotated with OVA/FID and LEL readings, the presence of odors, staining, peat, organic material, fossils, asphalt bits and lithologic description. Copies of the field logs and complete chains of custody shall be received by the Bureau of Engineering (BOE) by 9:00 a.m. the day following drilling of each boring to confer with the Consultant on assigning of chemical tests per sample. The copies can be emailed to bryan.powell@lacity.org.

Environmental samples shall be collected in the borings at 1 foot (a composite sample from immediately under pavement to 1 foot depth bgs), 2.5 feet bgs, 5 feet bgs, and every 5 feet thereafter to total depth. The first 5 feet will be hand-augered to avoid shallow utilities (the 1 and 2.5-foot sample will be from the hand auger cuttings). Soil sampling shall terminate when groundwater is reached. Drilling will proceed to 25-feet bgs or to groundwater if encountered shallower, and a 'grab' sample of groundwater in one (1) boring shall be obtained for testing before boring termination.

All field work shall be documented in a field notebook, recording pertinent location data, weather conditions, observations and other information.

- Drill, log, and sample a total of 5 borings with a hollow-stem auger drill rig and sample with a clean California split spoon or Shelby-type sampler.
- The borings shall be drilled to a maximum of 25 feet below the ground surface, or into groundwater, whichever comes first.
- Sample and log all borings under the direct supervision of a California Certified Engineering Geologist or California Professional Geologist. Geologic features such as contacts, lithology, cobbles, joints, secondary mineralization, etc. shall be noted.
- Samples for VOCs shall be obtained using EPA Method 5035 protocol, the "encore" or equivalent equipment, and lower detection limits for VOS, to current LA Regional Water Quality Control Board standards.
- The first of the duplicate samples at each sample depth shall be sealed, labeled, bagged and placed in an ice chest and transported under chain of custody protocol to a State-certified environmental laboratory within 24 hours. If possible, exclude fragments of asphalt and wood, and note in the logs any presence of peat, wood or other organic matter.

- Organic vapor analyzer (OVA) or photo-ionization detector (PID) measurements of volatile organics will be made with an organic vapor analyzer (OVA) or photo ionizing detector (PID) that has been calibrated to factory specifications within the last 3 months of testing and recalibrated with gas daily. OVA or PID readings shall be obtained on duplicate samples at the surface from each sampling depth, which have been placed in new plastic sealed bags or clean glass jars and allowed to sit in the sun or warm area for 5-10 minutes. A Lower Explosive Limit (LEL) or combustible gas meter shall be at the ground surface area following each sample barrel removal. LEL, hydrogen sulfide concentration and OVA/PID readings shall be annotated on the logs. The OVA and LEL shall be calibrated daily according to manufacturer's instructions. Notify BOE immediately if contamination (obvious visual staining and/or OVA readings of more than 50 ppm) is encountered.
- Latitude and longitude of the boring locations as read from a handheld GPS (NAD 83 coordinate system) unit accurate to within 3 feet shall be included. Descriptions and measurements from prominent features such as curbs, buildings and fences shall be provided on each boring log.
- The borings in paved areas shall be backfilled with one-sack sand cement slurry or cement/bentonite mixture to approximately 4 inches below the base of the existing pavement or surface, by tremieing from the bottom of the holes. Asphalt or concrete removed during drilling shall be replaced to match the existing pavement.
- Assume all soil cuttings to be potentially contaminated and will be stored temporarily in 55-gallon drums, which will be sealed and clearly labelled. Removal shall be arranged as soon as the soil is characterized for disposal.
- If the boring soils are in contaminated material at the bottom 10 ft. of the boring, BOE shall be contacted for possible extension of the boring.

Sample collection and QA/QC procedures shall be in accordance with the latest version of the "Interim Guidance for Active Soil Gas Investigations" by the Los Angeles Regional Water Quality Control Board and be documented in the final report.

Also, manually obtain 8 surficial samples in planters, medians, etc. to a depth of 1 foot for one composite, bulk sample per location.

Task 5 - Environmental Laboratory Analysis of Samples

The following list provides the chemical tests that will likely be assigned for the soil boring samples. A California OHS-certified environmental laboratory shall be used.

Stormwater Capture Parks Program
Pre-Design and Design Services

Task Order Solicitation (TOS) No. 25

Assume for budgetary purposes that the following number of tests will be assigned (the actual assignment of testing will depend on OVA readings, odors, and staining encountered in the samples):

- 20 tests for EPA 1664 (TRPH),
- 6 tests for EPA 8015M (Carbon chain speciation),
- 6 tests for EPA 8260B or equivalent (VOCs, including oxygenates),
- 4 tests for EPA 8270C or equiv. (SVOCs),
- 2 tests for EPA 8310 (Polycyclic aromatic hydrocarbons/PAHs),
- 15 tests for EPA 6010B/Title 22 metals (TTLC), and assume 2 WET tests EACH for lead and arsenic,
- 5 tests for EPA 8081/2A or equiv. (Organochlorine Pesticides & PCBs),
- 5 Tests for EPA 8150 (Herbicides).
- The groundwater 'grab' sample from one well shall be tested for TRPH, VOCs, SVOCs, PAHs, heavy metals and general water quality parameters, including pH, nitrates, sulfates, etc.
- Laboratory reports with full QA/QC data and quantification limits shall be included in the final report. The presence of contaminants shall be summarized in a chart or table, highlighting levels exceeding residential USEPA Region 9 RSLs.
- Rush turnaround times are expected.

Task 6 - Phase II Site Assessment Report

The Consultant shall provide a final report, summarizing observations and field activities, background data collected, field and laboratory testing, and drilling and sampling methods. The investigation shall be directed by and the report stamped and signed by a California-licensed geologist, hydrogeologist or engineer.

A review copy should be sent to BOE before finalizing. One unbound hard copy and an electronic copy of the report is required.

The report shall include a scaled, drafted base map and plot plan showing the study location in a regional setting, well and sampling locations. The report will include appendices with well logs, and copies of field log book entries or data sheets

annotated with will head OVA/PID/LEL readings, site observations as detailed above, and laboratory data sheets with chain of custody and QA/QC forms. Laboratory data shall be summarized on a chart or table with significant measurements of contaminants and gases highlighted.

Report conclusions should include a comparison of contaminant levels with appropriate maximum regulatory levels and appropriate health-based levels such as State RSLs, PELs and TWAs for residential site use.

The report will consist of:

- A scaled plot plan of the site with boring locations, existing structures, roads and rail lines, vent structures, etc.
- Description of the field exploration including field and laboratory testing procedures. Include the geophysical grid locations and a map of anomalies found.
- Logs of all soil borings annotated with soil types, odors, staining and gas meter readings. Include elevations of tops and bottoms of excavations estimated to the nearest foot from topographic maps.
- Classification and description of soil, with contacts between geologic materials, strikes and dips of planar features, water seeps and depth to groundwater, odors, staining and other descriptions observed and all OVA, PID and/or LEL readings taken during excavations.
- Laboratory soil data as an appendix, with all QA/QC data and method quantification limits and chain-of-custody forms shall be attached. In the body of the report, summarize any positive findings of contaminants with comparison with PRGs or other relevant action levels.
- Conclusions, including comparison of contaminant levels with appropriate regulatory levels and appropriate health-based levels for residential use.
- One copy of the draft report shall be submitted to BOE for review. After review comments are incorporated into the report, one unbound original copy (wet signatures) and in pdf format, shall be submitted to BOE.

Note that latitude and longitude readings are required for all borings and test pits/hand augered borings. These values shall be obtained by reading the latitude and longitude at each sampling location with a standard consumer quality hand held GPS unit (NAD 83 Coordinate System). The coordinates from these units are only accurate to about a 50- foot radius, but that will be adequate for our purpose which is

to create and maintain a Geographic Information System (GIS) database of all boring locations in the City. Due to the inherent accuracy of the coordinates, a written description and measurements to monuments, curb faces, intersections, etc. will still be required.

Task 7 - Waste Disposal

Soil and decontamination water generated during the field activities will be temporarily contained in 55-gallon drums on the site away from drainage areas and secured from unauthorized entry until laboratory analytical results are received, allowing the most cost-effective disposal or recycling option. For budgeting purposes, assume that most soil and decontamination water produced during this task will be contaminated at non-hazardous levels with petroleum hydrocarbons and that off-site disposal at a Class II recycling facility in the Los Angeles area is possible. BOE has a list of such facilities. The Consultant or qualified subconsultant shall prepare waste manifests and arrange for proper transport and disposal of all drummed cuttings and water. BOE or other City representatives such as the site manager will sign the manifests as the Generator. Clearly legible copies of all manifests shall be provided as soon as available to BOE.

Any generated clean rinse or produced water is to be disposed of in the City sewer under a blanket waste discharge permit for non-contaminated water issued by Industrial Waste Division of the BOS. Assume for budgeting purposes that the water drums will require disposal at a contaminated water recycling facility.

Produced and rinse water and soil cuttings shall be stored in DOT-approved 55-gallon steel drums near the drilling sites, in protected areas away from drainages. The drums shall be disposed of following classification as hazardous or non-hazardous, within 90 calendar days. Drummed water with no detectible hydrocarbons and with metals below action levels may be emptied into the sewers; this office will help with getting a permit from the Industrial Waste Section, Bureau of Sanitation. The consultant shall prepare all manifests and arrange for the proper transportation and disposal of the cuttings and rinse water. BOE staff will sign as Generator. Legible copies shall be attached to the final report. It is anticipated that fuel- and oil-contaminated soil will be accepted at a Class II soil recycling facility in the Los Angeles area, which is the preferred disposal method by the City.

Stormwater Capture Parks Program
Pre-Design and Design Services

Task Order Solicitation (TOS) No. 25

CONTINGENCY ITEMS

In addition to the base tasks and associated costs outlined above, contingency costs shall be provided for the following items in case unusual and/or unforeseen conditions justify an increase in the approved scope of work. Contingency prices will also be considered in determining the value of the TO Proposal. Please provide unit costs for the following items:

- Cost per linear foot for additional drilling and sampling of borings.
- Cost to mobilize drill rig including any minimum charges for additional borings drilled on a different day than the base cost drilling. Please detail the items included in the cost.
- Cost per linear foot for additional borings to acquire contamination samples at 5-foot intervals, including the extra cost of obtaining the samples, storing the samples properly and maintaining a chain of custody.
- If signs of contamination are encountered and/or if OVA or PID readings of more than 50 ppm are detected, all drill cuttings shall be properly disposed of off the site. Provide cost per cubic foot to dispose of contaminated drill cuttings for various levels of contamination.
- Cost per linear foot for backfilling of borings with cement slurry to within 5-feet of the ground surface and compacted earth above.

II. QUESTIONS AND ANSWERS

Respondents are hereby notified to replace response A12 of TOS 25 Addendum 4 (issued July 29, 2019):

Q12. Will LADWP be involved with the selection process?
A12. No.

With the following:

Q12. Will LADWP be involved with the selection process?
A12. Yes.

Work Plan Approval

WORK SITE ADDRESS	CITY	ZIP	EMAIL ADDRESS
8041 Whitsett Ave	North Hollywood	91601	kbrigham@ninyoandmoore.com

NOTICE:

- WORK PLAN APPROVALS ARE VALID FOR 180 DAYS. 30 DAY EXTENSIONS OF WORK PLAN APPROVALS ARE CONSIDERED ON AN INDIVIDUAL (CASE-BY-CASE) BASIS AND MAY BE SUBJECT TO ADDITIONAL PLAN REVIEW FEES (HOURLY RATE AS APPLICABLE).
- WORK PLAN MODIFICATIONS MAY BE REQUIRED IF WELL AND GEOLOGIC CONDITIONS ENCOUNTERED AT THE SITE INSPECTION ARE FOUND TO DIFFER FROM THE SCOPE OF WORK PRESENTED TO THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.
- WORK PLAN APPROVALS ARE LIMITED TO COMPLIANCE WITH THE CALIFORNIA WELL STANDARDS AND THE LOS ANGELES COUNTY CODE AND DOES NOT GRANT ANY RIGHTS TO CONSTRUCT, RENOVATE, OR DECOMMISSION ANY WELL. THE APPLICANT IS RESPONSIBLE FOR SECURING ALL OTHER NECESSARY PERMITS SUCH AS WATER RIGHTS, PROPERTY RIGHTS, COASTAL COMMISSION APPROVALS, USE COVENANTS, ENCROACHMENT PERMISSIONS, UTILITY LINE SETBACKS, CITY/COUNTY PUBLIC WORKS RIGHTS OF WAY, ETC.
- THIS PERMIT IS NOT COMPLETE UNTIL ALL OF THE FOLLOWING REQUIREMENTS ARE SIGNED BY THE DEPUTY HEALTH OFFICER. WORK SHALL NOT BE INITIATED WITHOUT A WORK PLAN APPROVAL STAMPED BY THE DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM.

TO BE COMPLETED BY DEPARTMENT OF PUBLIC HEALTH—DRINKING WATER PROGRAM:

X	WORK PLAN APPROVED FOR: 15 Cone Penetrometer Tests	**PERMIT NUMBER:**	SR0213622	**DATE:**	2-11-2020

ADDITIONAL APPROVAL CONDITIONS:

- Work plan approval is issued for scope of work submitted to the Drinking Water Program. Any modifications to the scope of work will require additional work plan review.
- As discussed, please ensure the boring/exploration hole is backfilled within 24 hours of boring construction.
- Ensure to backfill using a tremie pipe under pressure or equivalent equipment with approved cement grout, proceeding upward from the bottom of the boring/exploration hole.
- Ensure soil borings are sealed per California Well Standards 74-90
  - Cement grout mix ratio of 5-6 gallons of water per 94-pound bag of Portland cement.
  - Up to 6% of Bentonite may be added to the cement-based mix.
  - No hydrated Bentonite chips
- Borings/Exploration holes must comply with all applicable requirements published in the California Well Standards (Bulletins 74-81 and 74-90) and the Los Angeles County Code, Title 11.

APPROVED BY:

Belinda Larsen, REHS

Please check appropate box below and attach all required analytical reports. Unless otherwise noted, composite samples should be collected with the following frequency: 1sample for 100 cubic yards or less ; 3 samples for 500 cu yds or less ; 5 samples for 1000 cu yds 1 additional sample for each additional 500cu yds greater than 1000 cu yds

[ ]

I/we certify that the soil referenced herein is contaminated soley by Virgin petroleum products from leaking underground storage tank(s).

Attached is analytical data from state certified lab for the following

1) Total Petroleum Hydrocarbons (TPH, EPA 8015 Modified)

2) Benzene/Toluene/Ethylbenzene/xylene (BTEX, EPA 8020)

[X]

I/We certified that some or all of the contaminants in the soil referenced herein is waste oil, or some other non-virgin petroleum product, or virgin petroleum product from something other than a leaking underground storage tank.
Attached is analytical data from a state certified lab for the following:

1) Total metals concentration for a thru q below (TTLC test)

a) Antimony	g)Cobalt	m) Selenium
b) Arsenic	h)Copper	n) Silver
c) Barium	I) Lead	o) Thalium
d) Berylium	j) Mercury	p) Vanadium
e) Cadmium	k) Molybdenum	q) Zinc
f) Chromium	l) Nickel	

Note: If any item a thru q is greater than 10 times its Soluble Threshold Limit concentration (STLC) the soluble metal concentration must be determined by the Waste Extraction Test procedure.

2) TPH by:

EPA 418.1 or
EPA 8015 modified

3) BTEX/VOC by:

EPA 8020 EPA 8010
or EPA 8260(combines above)

4) PCB'S(waste oil only)
5) Additional analytical data as required.

No soils referenced herein may be delivered until the forgoing certificate is received and approved by the facility, and they issues manifests and assigns an approval number. If any soils delivered to the facility are found to be "Hazardous Waste" pursuant to federal or state regulations, the client shall be solely responsible for their removal. If the client fails to remove such soils, the facility, acting as client's agent, may arrange for such removal at client's expense. This is a complete and accurate description of the soil referenced herein; no deliberate or willful omissions have been made and all known or suspected hazards have been disclosed herein. I/We certify that the soil is not "hazardous" as defined by U.S. Department of Transportation (DOT), U.S. Environmental Protection Agency (EPA), State or local regulations. I/We further certify that the soils referenced herein contain no free liquids. All analysis reports attached.

ENTHALPY ANALYTICAL

Case Narrative

Ninyo & Moore 475 Goddard Suite 200 Irvine, CA 92618 Keith Gilbert	Lab Job Number:	426382
	Location:	Strathern Park Soil Sampling / 8041 Whitsett Ave., No. Hollywood, CA
	Date Received:	03/24/20

This data package contains sample and QC results for ten soil samples, requested for the above referenced project on 03/24/20. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):
High RPD was observed for diesel C10-C28 in the MS/MSD of P-4-10' (lab # 426382-012); the high RPD was not associated with any reported results. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
High response was observed for 4-nitrophenol in the CCV analyzed 03/30/20 16:25; affected data was qualified with "b". High recovery was observed for 4-nitrophenol in the MS for batch 243926; the parent sample was not a project sample, the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
No analytical problems were encountered.

Pesticides (EPA 8081A):
All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. All samples underwent florisil cleanup using EPA Method 3620C. Low surrogate recoveries were observed for TCMX in a number of samples; the corresponding decachlorobiphenyl surrogate recoveries were within limits. No other analytical problems were encountered.

PCBs (EPA 8082):
All samples underwent sulfuric acid cleanup using EPA Method 3665A. All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. Low recoveries were observed for Aroclor-1016 and Aroclor-1260 in the MS of P-4-1' (lab # 426382-009); the LCS was within limits. High RPD was also observed for Aroclor-1016 and Aroclor-1260 in the MS/MSD of P-4-1' (lab # 426382-009); these analytes were not detected at or above the RL in the associated samples. Low surrogate recoveries were observed for decachlorobiphenyl (PCB) in P-4-1' (lab # 426382-009) and the MS of P-4-1' (lab # 426382-009). No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):
Low recoveries were observed for antimony in the MS/MSD for batch 243740; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits. No other analytical problems were encountered.

Total Oil and Grease in Solids (EPA 1664A M):
No analytical problems were encountered.

8151A Chlorinated Herbicides (EPA 8151A):
American Environmental Testing in Burbank, CA performed the analysis (not NELAP certified). Please see the American Environmental Testing case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore Project: Strathern Park Soil Sampling

Date Received: 3/24/20 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 2.6 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.8 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✓		
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?	✓		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 3/24/20

COOLER RECEIPT FORM

Client Name: ENTHALPY - ANALYTICAL
Project Name:
AETL Job Number: 104217
Date Received: 3/25/20 Received by: Sanjis-P
Carrier: ☒ AETL Courier ☐ Client ☐ GSO ☐ FedEx ☐ UPS
☐ Others:

Samples were received in: ☒ Cooler (1) ☐ Other (Specify):
Inside temperature of shipping container No 1: 3.3°C, No 2: , No 3:
Type of sample containers: ☐ VOA, ☐ Glass bottles, ☒ Wide mouth jars, ☐ HDPE bottles, ☐ Metal sleeves, ☐ Others (Specify):
How are samples preserved: ☐ None, ☑ Ice , ☐ Blue Ice, ☐ Dry Ice
☑ None, ☐ HNO_3, ☐ NaOH, ☐ ZnOAc, ☐ HCl, ☐ $Na_2S_2O_3$, ☐ MeOH
☐ Other (Specify):

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	✓		
2. Are the Sample labels legible?	✓		
3. Do samples match the COC?	✓		
4. Are the required analyses clear?	✓		
5. Is there enough samples for required analysis?	✓		
6. Are samples sealed with evidence tape?	N/A		
7. Are sample containers in good condition?	✓		
8. Are samples preserved?	✓		
9. Are samples preserved properly for the intended analysis?	✓		
10. Are the VOAs free of headspace?	N/A		
11. Are the jars free of headspace?	✓		

PLEASE NOTE ALL SAMPLES WILL BE DISPOSED OF 30 DAYS AFTER RECEIVING DATE. IF AETL IS INFORMED OTHERWISE, THERE WILL BE A STORAGE CHARGE PER SAMPLE PER MONTH FOR ANY SAMPLE HELD BEYOND 30 DAYS.

Explain all "No" answers for above questions:

CERTIFICATE OF ANALYSIS
CASE NARRATIVE

AETL received 2 samples with the following specification on 03/25/2020.

Lab ID	Sample ID	Sample Date	Matrix	Quantity Of Containers
104217.01	P-2-1'	03/24/2020	Soil	1
104217.02	P-4-1'	03/24/2020	Soil	1

Method ^ Submethod	*Req Date*	*Priority*	*TAT*	*Units*
(8151A)	04/01/2020	2	Normal	ug/Kg

The samples were analyzed as specified on the enclosed chain of custody.
No analytical non-conformances were encountered.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

Case Narrative

Ninyo & Moore 475 Goddard Suite 200 Irvine, CA 92618 Keith Gilbert	Lab Job Number:	426450
	Location:	Strathern Park Soil Sampling /8041 Whitsett Ave- Supplemental Report 1
	Date Received:	03/25/20

This data package contains sample and QC results for fifteen soil samples, requested for the above referenced project on 03/25/20. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):
High RPD was observed for diesel C10-C28 in the MS/MSD of P-4-10' (lab # 426382-012); the high RPD was not associated with any reported results. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):
No analytical problems were encountered.

Semivolatile Organics by GC/MS (EPA 8270C):
High response was observed for 4-nitrophenol in the CCV analyzed 03/30/20 16:25; affected data was qualified with "b". High recovery was observed for 4-nitrophenol in the MS for batch 243926; the parent sample was not a project sample, the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples. No other analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):
No analytical problems were encountered.

Pesticides (EPA 8081A):
All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. All samples underwent florisil cleanup using EPA Method 3620C. No analytical problems were encountered.

PCBs (EPA 8082):
All samples underwent sulfuric acid cleanup using EPA Method 3665A. All samples underwent sulfur cleanup using the copper option in EPA Method 3660B. No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A) Soil:
Low recoveries were observed for barium and antimony in the MS/MSD of WC-1 (lab # 426449-001); the LCS was within limits, and the associated RPDs were within limits. No other analytical problems were encountered.

Metals (EPA 6010B) WET Leachate:
No analytical problems were encountered.

Total Oil and Grease in Solids (EPA 1664A M):
No analytical problems were encountered.

8151A Chlorinated Herbicides (EPA 8151A):
American Environmental Testing in Burbank, CA performed the analysis (not NELAP certified). Please see the American Environmental Testing case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore Project: Strathern Park Soil Sampling

Date Received: 03/25/2020 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.4 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.1 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Sample ID "P-6-20'" on COC has no analysis. EN

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 03/25/2020

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Ranjit,

Can we please have the following 3 samples have analyzed for soluble lead (WET method) on 24 hour turnaround? (or as soon as possible if the process takes longer than that?)

B-1-2.5' – Total lead = 72 mg/kg
B-3-1' – Total lead = 51 mg/kg
B-3-2.5' – Total lead = 94 mg/kg

Thank you,

COOLER RECEIPT FORM

Client Name: Enthalpy

Project Name:

AETL Job Number: 104233

Date Received: 03/26/20 Received by: [signature]

Carrier: ☒ AETL Courier ☐ Client ☐ GSO ☐ FedEx ☐ UPS
☐ Others:

Samples were received in: ☒ Cooler (/) ☐ Other (Specify):

Inside temperature of shipping container No 1: 3.4°C, No 2: , No 3:

Type of sample containers: ☐ VOA, ☐ Glass bottles, ☒ Wide mouth jars, ☐ HDPE bottles, ☐ Metal sleeves, ☐ Others (Specify):

How are samples preserved: ☐ None, ☐ Ice, ☒ Blue Ice, ☐ Dry Ice
☒ None, ☐ HNO_3, ☐ NaOH, ☐ ZnOAc, ☐ HCl, ☐ $Na_2S_2O_3$, ☐ MeOH
☐ Other (Specify):

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	Y		
2. Are the Sample labels legible?	Y		
3. Do samples match the COC?	Y		
4. Are the required analyses clear?	Y		
5. Is there enough samples for required analysis?	Y		
6. Are samples sealed with evidence tape?		N	
7. Are sample containers in good condition?	Y		
8. Are samples preserved?	Y		
9. Are samples preserved properly for the intended analysis?	Y		
10. Are the VOAs free of headspace?	N/S		
11. Are the jars free of headspace?	Y		

PLEASE NOTE ALL SAMPLES WILL BE DISPOSED OF 30 DAYS AFTER RECEIVING DATE. IF AETL IS INFORMED OTHERWISE, THERE WILL BE A STORAGE CHARGE PER SAMPLE PER MONTH FOR ANY SAMPLE HELD BEYOND 30 DAYS.

Explain all "No" answers for above questions:

CERTIFICATE OF ANALYSIS
CASE NARRATIVE

AETL received 4 samples with the following specification on 03/26/2020.

Lab ID	Sample ID	Sample Date	Matrix	Quantity Of Containers
104233.01	P-6-1'	03/25/2020	Soil	1
104233.02	B-3-1'	03/25/2020	Soil	1
104233.03	B-1-1'	03/25/2020	Soil	1
104233.04	COMPOSITE 1-8	03/25/2020	Soil	1

Method ^ Submethod	*Req Date*	*Priority*	*TAT*	*Units*
(8151A)	04/02/2020	2	Normal	ug/Kg

The samples were analyzed as specified on the enclosed chain of custody.
No analytical non-conformances were encountered.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

Case Narrative

Ninyo & Moore 475 Goddard Suite 200 Irvine, CA 92618 Keith Gilbert	Lab Job Number:	426449
	Location:	Strathern Park Soil Sampling / 8041 Whitsett Ave., No. Hollywood, CA
	Date Received:	03/25/20

This data package contains sample and QC results for two soil samples, requested for the above referenced project on 03/25/20. The samples were received cold and intact.

TPH-Extractables by GC (EPA 8015B):

High RPD was observed for diesel C10-C28 in the MS/MSD of P-4-10' (lab # 426382-012); the high RPD was not associated with any reported results. No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):

Low recoveries were observed for barium and antimony in the MS/MSD of WC-1 (lab # 426449-001); the LCS was within limits, and the associated RPDs were within limits. No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore

Project: Strathern Park Soil Sampling

Date Received: 03/25/2020

Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 1 ☐ No (skip section 2)

Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 3.4 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.1 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____ ☐ Email (email sent to/on): _____ / _____

Project Manager's response:

Completed By: _____ Date: 03/25/2020

1 INTRODUCTION

On March 27 and 28 2021, Ninyo & Moore conducted an additional Phase II Environmental Site Assessment (ESA) at a portion of Strathern Park North, (site) located at 8041 Whitsett Avenue in North Hollywood, California as part of the Los Angeles Bureau of Engineering (LABOE) Stormwater Capture Parks Program. The term site as used in this report, pertains to the western, undeveloped area of the park; generally corresponding to the planned Construction Project area, located west of the baseball fields and other developed areas of the park, corresponding to a portion of APN 2308-010-901 and does not include the transmission lines easement to the southwest and the eastern developed park area to the east (Figures 1 and 2).

Per the September 21, 2020 meeting notes provided by LABOE pertaining to the *"Undocumented Waste at Strathern Park"* for the Stormwater Capture Parks Program, the City of Los Angeles, Department of Building and Safety acting as the solid waste Local Enforcement Agency (LEA) indicated that waste delineation for this additional Phase II ESA can be limited to the Construction Project limits. This was again confirmed during the March 24, 2021 site reconnaissance/project kick off meeting at which time Mr. David Thompson, of the LEA confirmed that this additional Phase II ESA would be restricted to the western undeveloped portion of Strathern Park North (portion of APN 2308-010-901) and does not include the entire park. The LEA further indicated that if wastes are present at the site boundaries, that it would not be required to *"chase"* the lateral extent of the wastes offsite (e.g., to the east at the baseball fields). Results of this Phase II ESA suggest wastes extend offsite into the baseball fields and possibly other areas beyond the site.

Previous to this additional Phase II ESA, in March and April 2020, Ninyo & Moore conducted a limited Phase II ESA in conjunction with a geotechnical evaluation. The limited Phase II ESA partially characterized and delineated wastes at the site and the geotechnical study evaluated the soil and geologic conditions at the site and provided geotechnical recommendations for pre-design of proposed Best Management Practices (BMPs) for stormwater infiltration.

The results of the previous Limited Phase II ESA and the geotechnical evaluation generally indicated that wastes were encountered in six borings and four test pits, and at these locations generally were observed to consist of primarily what could be generally referred to as construction debris (concrete, asphalt); with lesser amounts of bricks, plastic, glass, ceramic debris; bottles; and tires at depths of approximately 0.5 to 13 feet bgs. At locations explored, the waste materials were reported to be generally covered with approximately 0.5 to 2 feet of fill (or cover) soil. The depth of wastes was not delineated and wastes extend laterally outward from locations explored; however, waste delineation was not an objective of the previous Limited Phase II ESA, the scope of work of which was provided by others. The Limited Phase II ESA (Ninyo & Moore, 2020b)

recommended that because wastes were encountered at the site, the LEA should be notified and a copy of the report submitted for their review and comments and that other regulatory agencies may also require notifications. The LEA was notified of wastes at the site and locations where wastes were observed during the earlier March 2020 Limited Phase II ESA are summarized on Figure 3 of this report.

In response to their review of the Limited Phase II ESA, the LEA prepared a letter dated October 1, 2020 pertaining to the undocumented waste at a portion of Strathern Park (LEA, 2020, Appendix A). The letter indicated that regulatory agencies did not have records or information pertaining to waste disposal at Strathern Park. Because of the presence of wastes at a portion of the park, the waste disposal site was added to the California Department of Resources Recycling and Recovery (CalRecycle) Solid Waste Information System (SWIS) online database on July 29, 2021, and assigned SWIS #19-CR-0835.

In their October 1, 2020 letter, the LEA stated the following:

"In order to avoid any major impacts to the site from the construction of the stormwater capture park, the agencies have the following conditions:

- *The undocumented waste should be delineated and sample for COCs (chemicals of concern) related to waste materials within the project site.*
- *The project should be designed so as not to be constructed within the waste mass to prevent issues with leachate and/or landfill gas generation.*
- *Infiltration galleries that need to be constructed within the waste mass will be required to remove waste material and to properly disposed of it at a permitted facility.*
- *Submit a work plan that document the results of the waste delineation, details the specifics of the construction project and how it relates to the onsite waste, the procedures for dealing with any waste that is encountered and the environmental monitoring procedures that will be utilized during the construction. Part of the work plan should consists [STET] of a soils management plan, that addresses any SWPPP requirements and potential impacts to storm water, fugitive dust etc.*
- *After the completion of the project, an as-built report should be submitted."*

An April 8, 2021 work plan for the additional Phase II ESA was submitted to the LEA for their review and approval. The plan provided methodologies to evaluate the waste cover, characterize wastes by sampling and testing, and delineate wastes by excavating exploratory test pits. Additionally, the plan stated that certain LEA-requested information as indicated in their October 2020 letter would not be included in the work plan since it was not consistent with conducting a Phase II ESA. More specifically, it was clarified that a soil management plan (SMP) (aka Waste Management

Plan [WMP]) and Storm Water Pollution Prevention Plan (SWPPP) were not applicable at the time in association with the planned additional Phase II ESA.

In an April 22, 2021 letter, the work plan for the additional Phase II ESA was approved by the LEA without conditions related to the planned investigation (LEA, 2021). As was anticipated, based on the presence of wastes at the site, the LEA stated and requested the following:

"On April 8, 2021, the City of Los Angeles Local Enforcement Agency (LEA) received the ***Work Plan to Conduct Additional Phase*** *II* ***Environmental Site Assessment,*** *dated April 7, 2021, for the Stormwater Capture Parks Program at a portion of Strathern Park North. The work plans objectives are to characterize and delineate the waste at the site, evaluate the current cover and conduct sampling and analytical testing to characterize the wastes. The LEA has shared the work plan with our partnering state agency, California Department of Resources Recycling and Recovery (CalRecycle) for their review and comment.*

After discussion with CalRecycle, the LEA has the following comments regarding the site:

- *The LEA approves of the Work Plan for the Additional Phase II Environmental Site Assessment. The operator can proceed with the work according to this plan. The LEA must be notified and grant approval of any substantial changes to this work plan prior to implementation.*

- *After completion of the Phase II ESA, a Waste Management Plan should be prepared to be used any time subsurface activities are conducted at Strathern Park North (a portion of which is the site) based on the park being the location of waste disposal. The WMP should include the entire park.*

- *Based on the original geotechnical investigation performed and information from boring and trench logs, the site is a disposal site and would be subject to solid waste state minimum standards.*

- *The site will need to be included on CalRecycle's Solid Waste Information System (SWIS) and obtain a site specific number. Please complete and return the attached form to the LEA with the necessary site owner and operator information. The LEA will work with CalRecycle on issuing the SWIS number.*

- *Pursuant to 27 CCR 21190, a post closure land use plan is required for this project. The plan should reflect the findings from this Phase II study. As part of this plan, a landfill gas monitoring plan should be included that demonstrates the protection of the adjacent residential property.*

- *It is recommended that clean-closure of the waste in the project site. If all of the waste cannot be removed, then the waste that remain in place will need to comply with state minimum standards and long-term maintenance and monitoring."*

2 PROJECT DESCRIPTION AND PROPOSED CONSTRUCTION

The Stormwater Capture Parks Program is a joint program between the Los Angeles Department of Public Works Bureau of Engineering (LABOE) and the Los Angeles Department of Water and Power (LADWP) to capture and infiltrate stormwater at nine parks located within the northeastern San Fernando Valley. The goals of the program include increased local water supply through the recharge of the groundwater basin, alleviate localized flooding, improve downstream receiving water quality by providing pollutant load reductions associated with the capture and infiltration of stormwater runoff, and improve park amenities, recreation opportunities, and environmental education opportunities for the local community. One of the parks included in this program is Strathern Park North.

Based on information provided, the Strathern Park North Stormwater Capture project includes diverting flows from an existing 45-inch storm drain that runs parallel to State Route (SR) - 170 on the western side of the site to an underground infiltration gallery located within the open field area between the LADWP transmission line right of way and the eastern park area consisting of baseball fields. Two new baseball fields are proposed to be constructed on the surface above the infiltration gallery with landscaping and a parking lot. In addition, BMPs for the project include a diversion structure, approximately 300 linear feet of 36” RCP storm drain pipe, a hydrodynamic separator, slide gate for facility isolation, and maintenance holes. The facilities were designed to capture and infiltrate approximately 24 acre feet per year of stormwater runoff from two tributary areas (total 447 acres) north of the park.

The infiltration gallery footprint is approximately 1.5 acres with an overall internal clear height of 8 feet and will be constructed using modular precast concrete structures with small drain holes at the bottom. The bottom of the infiltration gallery will be approximately 26 feet below existing ground surface and sits on top of an 18-inch layer of crushed stone, so the overall depth of excavation at the infiltration gallery will be about 20 feet. The soil underneath the crushed stone will not be compacted in order to not interfere with infiltration. A 24-inch layer of crushed stone will extend beyond the perimeter of the infiltration gallery with a vertical layer of filter fabric on the sides of the gallery. Compacted fill will be placed on top of the infiltration gallery to the newly graded surface for use as a park. The planned construction is referred to in this report as the Construction Project.

3 PROJECT OBJECTIVES

There does not appear to be background information available pertaining to waste disposal activities at the site. Aerial photographs from the early 1950s and possibly later in the late 1960’s of the site and vicinity appear to show surface disturbances suggestive/interpreted to be related

to waste disposal activities at the site, at the adjacent eastern developed park area, and possibly extending beyond the limits of the now developed portion of the park.

Based on this, the primary objectives of the Phase II ESA were as follows:

- Characterize and delineate the lateral and vertical extent of wastes at the site. As was expected, the lateral waste extent could not be completely delineated since wastes were observed in test pits located at the site boundary and based on this are assumed to continue to the east developed area of the park.
- Waste delineation was based on the following information:
    - Background information, primarily interpretation of historical aerial photographs (Appendix B).
    - Results of the previously conducted Limited Phase II ESA and geotechnical evaluation (Ninyo & Moore, 2020 b, c).
    - Results of the geophysical survey that was conducted generally concurrently at the site (Appendix C).
    - Results of the exploratory test pit excavations (additional Phase II ESA) indicating the presence or absence of wastes, and if present, the types of wastes (Appendix D).
- Evaluate the presence of cover overlying wastes by observing subsurface materials in the exploratory test pit excavations and characterizing the cover soil by sampling and analytical testing.
- Evaluate whether soils adjacent to and/or underlying wastes have been impacted by the wastes by collecting soil samples and analytical testing.
- Where present, conduct sampling and analytical testing to characterize the wastes. If the wastes were not conducive to sampling and testing (e.g., solid pieces of concrete, asphalt debris/rubble, etc.), samples of the soils mixed with wastes were collected for analytical testing.

The results of this additional Phase II ESA provide information about waste locations and extent in relation to the planned construction project, waste types and characterization. The information is anticipated to also be used in future regulatory agency submittals (e.g., WMP and Post Closure Land Use plan [PCLUP], as applicable).

4 SITE DESCRIPTION

Strathern Park North is a City of Los Angeles park located in North Hollywood, east of California SR-170, approximately one-mile south of Interstate 5 (I-5). The park consists of a relatively level, roughly triangular-shaped area bounded by a LADWP transmission line (TL) easement on the southwest followed by commercial/industrial properties and associated parking,

residential properties to the adjacent north (not separated by a street), Whitsett Avenue followed by residential properties to the east, and Strathern Street followed by Jamie Beth Slaven Park to the south.

The site that is the subject of this additional Phase II ESA and generally corresponds to the area of the planned Construction Project is the western area of the park that consists of undeveloped land and corresponds to a portion of Assessor's Parcel Number (APN) 2308-010-901. The eastern approximate half of the park (adjacent to and east of the site) is developed with four baseball fields, restroom and concession facilities an asphalt concrete (AC) parking lot, cement concrete walkways, landscaping, and other miscellaneous improvements and extends beyond the area of the planned Phase II ESA. The transmission line easement also occupies a portion of the same APN, and is outside the site boundary of this Phase II ESA. Based on review of topographic maps obtained from Environmental Data Resources (EDR) Inc., the park slopes gently toward the southeast with site elevations ranging from approximately 808 feet above mean sea level (MSL) at the northwest corner of the park to approximately 800 feet (MSL) at the southeast corner.

As observed during the April 27 and 28, 2021 Phase II ESA field work, the site consists of undeveloped land that is sparsely vegetated. The majority of the ground surface at the site was observed to be several feet higher in elevation than the adjacent transmission line easement to the southwest, and the adjacent residences to the north. This may be associated with the placement of cover soil over previously disposed wastes at the site. To the east, the site is approximately the same elevation as the developed eastern park area consisting primarily of baseball fields and associated improvements/structures. In the area of the northern site boundary, just south of the residences, scattered waste debris was observed on the ground surface, primarily consisting of concrete rubble and some metal rebar.

5 OWNERSHIP

Strathern Park North is addressed as 8041 Whitsett Avenue, North Hollywood and consists of two separate land parcels. The northern approximately 75 percent of the park is assigned APN 2308-010-901 and includes the western undeveloped area of the parcel that was the location of the additional Phase II ESA (Figure 3). The southern approximately 25 percent of the park is assigned APN 2308-010-902. Both land parcels that comprise the park and the electrical transmission easement to the southwest are owned by the City of Los Angeles.

6 RESPONSIBLE AGENCIES AND PERSONS

This section summarizes the parties responsible for the following tasks:

- **CDM Smith** - the engineering and construction firm that retained Ninyo & Moore to conduct the previous geotechnical study, previous limited Phase II ESA and this additional Phase II ESA. CDM Smith is the civil design engineer for the project (Stormwater Capture Parks Program). They are designing the BMPs for stormwater infiltration.

- **Los Angeles Bureau of Engineering (LABOE)** - supporting the planned Construction project.

- **The City of Los Angeles Department of Parks and Recreation** (**LADPR)** - property owner. They provided access to the property for the previous and current Phase II ESA.

- **City of Los Angeles LEA** - responsible for reviewing and approving the additional Phase II ESA work plan prior to conducting this Phase II ESA and reviewing and approving this additional Phase II ESA report. LEA staff was in the field during a majority of the Phase II ESA and observed the investigation.

- **Ninyo & Moore** - conducted the additional Phase II ESA in general accordance with the LEA-approved work plan, compiled the field and analytical data and summarized the information into this report.

7 ENVIRONMENTAL BACKGROUND

Background environmental information pertaining to waste disposal activities at the site does not appear to be available and it was indicated by the LEA that such information was not available from regulatory agencies. A request to the County of Los Angeles, Department of Public Health to check their records of waste disposal sites revealed no records of waste disposal at the site. With the exception of the Limited Phase II ESA and Geotechnical Study reports (Nnyo & Moore, 2021b, c), available background information is provided in (Appendices A and B).

The following summarizes available information pertaining to the site:

Limited Phase II Environmental Site Assessment, LABOE TOS No. 25, Stormwater Capture Parks Program, Strathern Park North, 8041 Whitsett Avenue, North Hollywood, California, Ninyo & Moore, June 2020

Ninyo & Moore conducted a Limited Phase II ESA at the westerly area of Strathern Park (APN 2308-010-902) in June 2020, as part of the LABOE Stormwater Capture Parks Program. The Phase II ESA was performed in conjunction with a geotechnical evaluation, the purpose of which was to evaluate the soil and geologic conditions and infiltration characteristics at the site and to provide geotechnical recommendations for pre-design of proposed Best Management Practices (BMPs) for stormwater infiltration. Relevant information from the Phase II ESA and the geotechnical study are summarized in the following paragraphs.

Limited background information, and results of the geotechnical evaluation and Limited Phase II ESA indicated the presence of wastes at the site and that these wastes likely continue into the eastern developed area of the park (i.e., baseball fields and parking lot) and possibly into adjacent areas outside the park limits. In general, the results of the previous geotechnical evaluation and Limited Phase II ESA indicated the following:

- Wastes were encountered at the site in six borings and four test pits and consisted primarily of construction debris (asphalt, concrete, brick) and lesser amounts of plastic, glass, and ceramic debris, bottles, and tires at depths of approximately 0.5 to 13 feet below ground surface (bgs). Locations where wastes were encountered are summarized on Figure 3 of this report.

- The depth of wastes at the site was not delineated and wastes appear to extend laterally outward from locations explored (site). Waste delineation was not an objective of the previous Limited Phase II ESA.

- At locations explored, the waste materials appear to be generally covered with approximately 0.5 to 2 feet of fill soil.

- A cursory review of readily available historical aerial photographs shows surface disturbances at the site over a period of years, other areas of the park, and possibly outlying the park that may be interpreted to be related to waste disposal. These areas appear to be generally consistent with results of this environmental assessment (e.g., presence of wastes at the site).

- The waste disposal site was not listed in the online CalRecycle SWIS database meaning that it is not a known and/or documented waste disposal site. As was mentioned in the report, there are numerous undocumented waste disposal sites similar to this site, statewide and it has been our experience that parks are often previous locations of waste disposal sites. The park (or a portion of the park) and possibly other locations extending offsite, including residential properties, may be the location of an undocumented, pre-regulations waste disposal site. Information pertaining to the possible lateral extent of wastes based on aerial photograph review and interpretation are provided in Section 7 of this report.

Stormwater Capture Parks Program, Meeting to Discuss Phase II ESA (Environmental Site Assessment) at Strathern Park North, June 9, 2020

The results of the limited Phase II ESA were presented by Ninyo & Moore staff during a June 9, 2020 online meeting. The following was discussed.

"Items of Discussion:

1. Ninyo & Moore presented their findings from Limited Phase II Site Assessment to LADWP and RAP

a. *Ninyo & Moore encountered waste materials, generally consisted of construction debris (i.e., concrete, asphalt, brick) and other miscellaneous materials (i.e., plastic, glass, ceramic, and tires)*

b. *The waste materials were encountered to depths of up to 13 feet bgs based on the locations explored.*

2. Next Steps & Recommendations:

a. *BOE to send email to Local Enforcement Agency (LEA) notifying them about inert waste found at the project site and attach Limited Phase II ESA Report for Strathern Park*

   i. *If the Limited Phase II ESA Report is completed by this week (6/12/20), BOE will forward that to LEA*

b. *Based on guidance from the LEA, the City will perform additional site investigations. CDM Smith and Ninyo & Moore will implement the additional site investigations by:*

   ii. *Developing a workplan*
   iii. *Performing additional historical investigations*
   iv. *Developing test pits locations*
      1. Test pits may be located within existing RAP baseball fields
   v. *Delineating the extent of waste*
   vi. *Characterizing the waste*

c. *The City, CDM Smith, and Ninyo & Moore will prepare a Post Closure Land Use Report for review by the LEA"*

Comment:

Based on a discussion with LEA staff while conducting the additional Phase II ESA, they seemed to be amenable to either having the PCLUP included as part of this report or submitted later as a separate document.

Notification to the LEA of Wastes Encountered at the Site, Email Correspondence to the LEA, June 12, 2020

Because wastes were encountered at the site (western park area), in an email dated June 12, 2020, the LEA was notified by LABOE of the presence of wastes at the site.

Undocumented Waste at Strathern, Teleconference Meeting Minutes, September 21, 2020

The teleconference meeting was attended by various parties associated with the construction project including the City of Los Angeles, LABOE, Los Angeles Department of Public Works, CDM Smith, Ninyo & Moore and the LEA (Appendix A). The LABOE provided the following summary of the meeting:

"Undocumented Waste at Strathern Meeting Minutes
September 21, 2020

1. Comments from LEA/RWQCB/CalRecycle on the Limited Phase II ESA report

a. *Could not find documentation of Strathern Park North as a landfill site.*

b. *RWQCB mentioned that a post-closure land use plan is not necessary since the waste was left at the site in the 1950s (before the Hazardous and Solid Waste Amendment - November 8, 1984).*

c. *Stormwater components shall not be constructed over waste material*

i. *Stormwater components shall not create leachate.*

ii. *Stormwater structures shall be constructed on proper subgrade. Remove waste material if necessary.*

iii. *Infiltration galleries will be installed approximately 20 to 25 feet below surface so galleries will likely require removal of waste and will be installed below the lowest point of waste encountered.*

1. Delineation of waste area

a. *LEA mentioned that the delineation of the waste can be limited to project limits. BOE does not have to explore the existing ballfield areas for waste.*

1. Miscellaneous

a. *Strathern Park North is not in a methane or methane buffer zone. Ninyo & Moore mentioned they performed a small test for methane with their borings and did not detect any methane gas.*

i. *See Section 10.7 Soil Gas Screening and Section 14.2 Duplicate and Field Screening of the draft Phase II ESA report.*

Action Items:

1. LEA to check with RWQCB and CalRecycle regarding the following:

a. *If BOE is only required to delineate waste within project limits.*

b. *Confirm with CalRecycle that a Post Closure Land Use Plan is not needed.*

c. *If a Post Closure Land Use Plan is not required, what sort of oversight documentation and reviews are required if any?*

1. LEA to send BOE a compiled list of comments from RWQCB and CalRecycle."

Comments:

The Water Board comment *"RWQCB mentioned that a post-closure land use plan is not necessary since the waste was left at the site in the 1950s (before the Hazardous and Solid Waste Amendment - November 8, 1984)"* does not make sense. Numerous pre-1984 waste disposal sites statewide have required a PCLUP when there is a change in land use. The Water Board should provide clarification and reference the source document for this determination.

The LEA stated that the Phase II ESA can be limited to the planned construction area of the park corresponding generally to the western undeveloped area, which is a portion of APN 2308-010-901 (Figure 3). Based on this, the lateral extent of wastes at the park likely would not be delineated.

LEA Comments on Undocumented Waste at Strathern Park, City of Los Angeles LEA, October 1, 2020

This LEA letter provided comments related to their review of the Limited Phase II ESA conducted at the site. The letter stated that regulatory agencies have searched their records and archives

and were not able to find any information regarding a *"landfill"* at Strathern Park. The letter further stated the following:

"In order to avoid any major impacts to the site from the construction of the stormwater capture park, the agencies have the following conditions:

- *The undocumented waste should be delineated and sample [STET] for COcs (chemicals of concern) related to waste materials within the project site.*
- *The project should be designed so as not to be constructed within the waste mass to prevent issues with leachate and/or landfill gas generation.*
- *Infiltration galleries that need to be constructed within the waste mass will be required to remove waste material and to properly disposed of it at a permitted facility.*
- *Submit a work plan that document the results of the waste delineation, details the specifics of the construction project and how it relates to the onsite waste, the procedures for dealing with any waste that is encountered and the environmental monitoring procedures that will be utilized during the construction. Part of the work plan should consists [STET] of a soils management plan, that addresses any SWPPP requirements and potential impacts to storm water, fugitive dust etc.*
- *After the completion of the project, an as-built report should be submitted."*

Work Plan to Conduct Additional Phase II Environmental Site Assessment, Stormwater Capture Parks Program, Portion of Strathern Park North, 8041 Whitsett Avenue, North Hollywood, California, Portion of APN 2308-010-901, Ninyo & Moore, April 7, 2021.

Ninyo & Moore prepared a work plan consistent with conducting Phase II ESAs at waste disposal sites that provided methodologies to characterize and delineate wastes, evaluate waste cover and whether soils adjacent to or underlying wastes may be impacted by the wastes. The work plan also clarified what would not be included in the plan that was requested by the LEA in their earlier October 2020 letter as follows:

"This work plan does not provide specific details of the construction project and how it relates to the onsite wastes because the location(s) of the wastes in relation to the construction project is not known at this time. The purpose of this work plan is to conduct an investigation to evaluate waste locations in relation to the planned construction project. This requested information is not consistent with a Phase II ESA work plan; however, this information can be included in the Phase II ESA report to be prepared after the investigation is conducted.

This work plan does not detail "… the specifics of the construction project and how it relates to the onsite waste" because the locations of the onsite waste are not known at this time and the purpose of the work plan is to identify locations of the onsite wastes. In addition, information pertaining to the planned construction project and how it relates to onsite wastes is typically contained in a PCLUP (or with regulatory approval, can be included as a modified plan in the Phase II ESA report) which details the change in land use from undeveloped land to a stormwater infiltration basin and shows the relationship of the wastes to the planned construction. This requested information is not consistent with a Phase II ESA work plan.

The work plan does not include procedures for managing wastes that are encountered and environmental monitoring during construction since such information is anticipated to be contained

in a subsequent Waste Management Plan (WMP). A WMP includes information on the types of wastes that may or will be encountered at the site based on results of the Phase II ESA and will provide information on how to manage the wastes encountered during construction and other possible future site activities that involve excavating into the subsurface (e.g., replacing piping, grading, etc.). Following completion of the additional Phase II ESA, a Phase II ESA report will be provided presenting the findings of the investigation. Other documents that rely on information presented in the Phase II ESA including the WMP and PCLUP (if separately provided) will be submitted separately to the LEA. However, to expedite the project and for efficiency, the Phase II ESA can include information that would be contained in a PCLUP.

A soil management plan (SMP) (aka WMP) and Storm Water Pollution Prevention Plan (SWPPP) are not applicable to a Phase II ESA work plan. The activities to be conducted during the planned Phase II ESA generally consist of excavating temporary exploratory test pits that will typically be "open" for about 30 minutes to an hour at each location and then the excavated materials will be immediately placed back into the excavation from which they were removed. Therefore, management of soils (or wastes) and a SWPPP are not applicable to this work plan. Requirements for a SMP or WMP and a SWPPP would be applicable prior to the construction phase of the project, not during the Phase II ESA work plan, investigation, or report."

Strathern Park North, LEA Approval of Work Plan for Phase II Assessment, City of Los Angeles LEA, April 22, 2021

In an April 22, 2021 letter, the work plan for the additional Phase II ESA was approved by the LEA without conditions related to the planned investigation (LEA, 2021). As was anticipated, based on the presence of wastes at the site, the LEA stated and requested the following:

"On April 8, 2021, the City of Los Angeles Local Enforcement Agency (LEA) received the ***Work Plan to Conduct Additional Phase*** *II* ***Environmental Site Assessment,*** *dated April 7, 2021, for the Stormwater Capture Parks Program at a portion of Strathern Park North. The work plans objectives are to characterize and delineate the waste at the site, evaluate the current cover and conduct sampling and analytical testing to characterize the wastes. The LEA has shared the work plan with our partnering state agency, California Department of Resources Recycling and Recovery (CalRecycle) for their review and comment.*

After discussion with CalRecycle, the LEA has the following comments regarding the site:

- *The LEA approves of the Work Plan for the Additional Phase II Environmental Site Assessment. The operator can proceed with the work according to this plan. The LEA must be notified and grant approval of any substantial changes to this work plan prior to implementation.*

- *After completion of the Phase II ESA, a Waste Management Plan should be prepared to be used any time subsurface activities are conducted at Strathern Park North (a portion of which is the site) based on the park being the location of waste disposal. The WMP should include the entire park.*

- *Based on the original geotechnical investigation performed and information from boring and trench logs, the site is a disposal site and would be subject to solid waste state minimum standards.*

- *The site will need to be included on CalRecycle's Solid Waste Information System (SWIS) and obtain a site specific number. Please complete and return the attached form to the LEA with the necessary site owner and operator information. The LEA will work with CalRecycle on issuing the SWIS number.*

- *Pursuant to 27 CCR 21190, a post closure land use plan is required for this project. The plan should reflect the findings from this Phase II study. As part of this plan, a landfill gas monitoring plan should be included that demonstrates the protection of the adjacent residential property.*

- *It is recommended that clean-closure of the waste in the project site. If all of the waste cannot be removed, then the waste that remain in place will need to comply with state minimum standards and long-term maintenance and monitoring."*

8 HISTORICAL AERIAL PHOTOGRAPHS AND TOPOGRAPHIC MAPS

Historical and current aerial photographs reviewed and generally summarized below are included as Appendix B. Historical aerial photographs obtained from EDR Lightbox and Google Earth™ were reviewed for the years 1928 to 2019. The historical aerial photographs include overlays of property boundaries and some current site features for reference. Historical topographic maps were also reviewed for the years 1894 to 2012; however, some of the historical topographic maps did not provide information considered relevant to the additional Phase II ESA and therefore are not summarized in this section. The historical aerial photographs and topographic maps are provided as Appendix B.

The historical aerial photograph review focused on identifying possibly former waste disposal activities at the site. **Therefore, this section summarizes only some of the most pertinent information derived from the aerial photographs and therefore should not be considered a complete description of the site and/or waste disposal operations.** Figure 5 is a recent aerial photograph (2020) with the 1953 aerial photograph as an overlay. Based on the aerial photograph, it appears that surface disturbances that may be related to waste disposal activities appear to extend to locations beyond the lateral extent of the site (e.g., east to the baseball fields).

1894 to 1927 Topographic Maps: the two earliest topographic maps dated 1894 and 1896 indicate the site and area as undeveloped land and located to the east of the "*Pacoima Wash."* By 1902 the *"Pacoima Wash"* has been renamed the *"Tujunga Wash."* An unpaved road parallels and separates the wash to the west of the site and then continues south where it turns to the east. The 1920 topographic map indicates the westernmost area of the site within the wash and the area is generally developed with unpaved roads. The site is shown bisected by a north-south trending unpaved road that appears to delineate the eastern extent of the wash. The 1927 topographic map indicates what appears to be the same road bisecting the site (the Strathern Park North outline provided by EDR may be slightly off and the unpaved road could correspond to current Whitsett Avenue). By 1927, two generally parallel northwest – southeast trending electric transmission lines traverse the park site, one is located onsite. The 1927 topographic map indicates one and possibly two structures on the west side of the unpaved road, likely dwellings appearing to correspond to the eastern park area (offsite).

1928 Aerial Photograph: this photograph indicates the site as undeveloped land with the northwestern most site area traversed by what appears to be an active portion of an alluvial wash (Tujunga Wash) and a band of vegetation. Offsite in the area corresponding to the eastern area of the park it appears the site is traversed by a north-south trending feature, possibly an unpaved road. Unpaved Whitsett Avenue is located to the east. Offsite, the northeast (Area of Field 1) and southeast (southeast and south of Field 4) areas of the park are developed with undiscernible

activities and possibly some structures/dwellings. The southeastern developed area appears to continue south into Strathern Street and into Jamie Beth Slaven Park. To the east of Whitsett Avenue is a structure/dwelling.

1938 Aerial Photograph: this photograph indicates the site as generally similar to the earlier 1928 photograph in that the site is undeveloped land that appears to be inundated partially by the Tujunga Wash (The northeastern most area of the site appears to be part of the active area of the wash.) The active wash area appears to split and also traverses the easternmost boundary of the park extending onto Whitsett Avenue. The structure to the south partially in Strathern Street appears to be located west of the active wash area.

1947 Aerial Photograph: this photograph is of poorer quality than the previous photographs. It appears that the site and immediately adjacent areas consist of undeveloped land with sparse vegetation that appear to be located within an inactive alluvial wash area. The two previous structures/dwelling do not appear to be present.

1952 Aerial Photograph: this photograph indicates the site as undeveloped land with sparse vegetation within what appears to be an inactive wash area. Offsite, where what will become the eastern park area, appears to be the location of numerous, generally parallel trending unpaved roads entering from the east in the area of Whitsett Avenue, which is paved by this time. The ground surface at the future eastern park area appears to be disturbed. Offsite to the east (future eastern park area), unpaved roads appear to terminate to the west and northwest at locations of what appear to be stockpiled soils/materials dumped at the site and at the eastern park area. The photograph appears to indicate the southernmost unpaved road terminates to the northwest onsite at what appears to be an area of stockpiled material/dumped materials and a faint unpaved road appears to be located around the perimeter of the stockpile (typical of dumping). To the east of Whitsett Avenue is a residential development. Although not known, it is possible that the dumped materials may be related to what appears to be a recent development east of Whitsett Avenue. What appears to be onsite and offsite dumping may also be related to what appears to be grading to the north-northeast of the future park. Offsite at the future eastern park area are several small structures. The reader should also refer to the larger scaled georeferenced photographs provided by EDR that are also included in Appendix B.

1927 to 1948 Topographic Maps: the site and vicinity are not covered on the topographic maps provided by EDR.

1953 Aerial Photograph: this photograph indicates most of the site surface as highly disturbed as well as similar surface features to the east in the area that will become the eastern park area. The surface disturbances on and off site are suggestive of waste disposal activities and appear to indicate dumping/stockpiles and various elevations, suggestive of burying materials. By 1953, the residential development to the adjacent north of the park is not separated by any streets and appears to be undergoing development. Although not known, the surface disturbances that appear to be related to waste disposal activities both on and offsite to the east (e.g., at Strathern Park) may be related in part to residential construction projects in the area. The presence of a structure offsite at the eastern area of the future park that appears to be accessed via Whitsett Avenue with unpaved roads that extend from the structure to disturbed areas on and offsite corresponding to most of Strathern Park North suggests that the site and eastern area may have been a more formal waste disposal site.

1953 Topographic Map: this map indicates the site as undeveloped land and the future Strathern Park North as traversed by two sets of parallel, northwest to southeast trending power lines. (The southwesterly power lines are likely offsite to the adjacent southwest) Strathern Street terminates at the eastern park boundary and residential developments are to the north of the site and east of the park.

1964 Aerial Photograph: this photograph is of relatively poor resolution. It appears that by 1964, the site and future eastern park area are no longer the location of what appears to have been active waste disposal activities. Onsite, what may have been stockpiled materials originally appearing in the 1952 aerial photograph may still be present in 1964, although it is not entirely clear. What may be a rudimentary baseball field is located to the east of the site. Offsite are what appear to be mass graded areas that appear to be related to future construction of the power lines area easement and future SR-170.

1966 and 1972 Topographic Map: the 1966 and 1972 topographic maps indicate the site as undeveloped land. By 1966, additional development of offsite properties is evident and surrounds most of the site and park. In 1966, to the east of the site, SR-170 is indicated as *"Under Construction"* and the freeway is shown as completed in this area by 1972.

1967 Aerial Photograph: this photograph is higher resolution than the previous 1964 photograph. It appears the site is the location of significant surface disturbances that appear to be unpaved roads and possibly stockpiled materials. Offsite to the east, it appears there are two southern baseball fields and there is possibly a field to the north.

1970 Aerial Photograph: this photograph indicates the site appears to have been recently graded with unpaved roads accessing the site from the southwest from the power line and easement area and Strathern Street. By this time SR-170 has been constructed. To the east of the site are three baseball fields.

1979 and 1983 Aerial Photographs: these photographs indicate the site as still undeveloped land with several unpaved roads at the western site area that are no longer present by 1983. The majority of the site except for the northern most area (and the area along the southern portion of the eastern site boundary, 1979 photograph only) is darker colored, possibly related to vegetation. To the east of the site, the park is developed with three baseball fields and some small structures in 1979 and by 1983 it appears the baseball fields are better defined and the small structures seen earlier may not be present; however, there is what appears to be another small structure in this area. In 1979, the area offsite to the southwest, past the power lines and easement and west of SR-170, appears to have been used for parked trucks and other vehicles that are no longer present by 1983; however, there is a small structure or structures near the southern property boundary, just north of Strathern Street. By 1983, the park to the south of Strathern Street appears to have begun to be developed.

1989 Aerial Photograph: this infrared photograph indicates the site as undeveloped land with several unpaved roads traversing the site. To the east, the park layout appears generally similar to earlier photographs with some changes related to the presence of small structures. To the southwest, past the power lines and easement a relatively large structure appears to be under construction. To the south of Strathern Street, the park appears to be developed.

1994, 2002 and 2005 Aerial Photographs: these photographs indicate the site as undeveloped land and the 2002 infrared photograph shows the site similar in appearance with a relatively wide linear trending surface feature traversing the central southern site area suggestive of a poorly defined road or access(?) area. The site is similar in the 2005 photograph; however, the feature described in the 2002 photograph appears poorly defined and there appears to be a poorly defined possible road or feature near the northeastern site area. By 2002, the park area to the east consists of an additional field (Field 1). By 2002, to the southwest, past the power lines and easement the property is developed with large buildings and parking areas.

2009 and 2012 Aerial Photographs: the 2009 photograph is of poor resolution; however, the site appears to contain darker and lighter colored areas or features and at the southeastern site area something is going on that cannot be discerned due to the poor quality of the image. The 2012 photograph suggests the site is or was the earlier location of something going on that cannot be discerned from the image, particularly at the southern portion and although not known, there may be stockpiled materials or possibly the site was used as a construction staging area, possibly associated with park development to the east. To the east, the park and fields appear to have undergone additional development.

2012 Topographic Map: the 2012 topographic map is not too informative showing the site as undeveloped land, absent of power lines and surrounded by development and the SR-170 to the west.

2016 and 2019 Aerial Photographs: the 2016 aerial photograph indicates the site as undeveloped land with little to no vegetation and the central eastern area of the site as the location of what appears to be recent surface disturbance/grading that appears to generally correspond to an area extending from the eastern park area between Fields 2 and 3. By 2019, it appears that the area of surface disturbance onsite has expanded and the central and southern areas appear to be disturbed/partially graded. The 2016 photograph shows that to the east, the fields in the park look to be in relatively poor condition and although not known, possibly the site to the west was used for materials to grade the eastern park area fields. In 2016, unidentifiable materials may be stockpiled in the power line area and easement.

9 PHYSICAL SETTING

The following summarizes topographic, geologic, and hydrogeologic information at, and in the vicinity, of the site, based upon the referenced documents reviewed and/or our site reconnaissance and field investigation.

9.1 Topography

Based on review of topographic maps (NavigateLA, 2020), the park slopes gently toward the southeast with site elevations ranging from approximately 808 feet (MSL) at the northwest corner of the park to approximately 800 feet (MSL) at the southeast corner.

9.2 Geology and Wastes

Review of regional geologic maps indicate that the site is generally underlain by Holocene-age (alluvial) wash deposits associated with deposition along the Tujunga Wash (Campbell et al., 2014). The deposits are described as consisting of unconsolidated gravel, sand, and silt in active or recently active stream beds. The California Department of Mines and Geology (CDMG, 1997) has also mapped the site as being underlain by wash deposits consisting of loose to medium dense, sand and silty sand with lesser quantities of silt and gravel.

During the previous geotechnical evaluation and both the Limited and additional Phase II ESAs, undocumented fill and alluvium was encountered to the total depths explored. Generalized descriptions of the materials encountered during this Phase II ESA are summarized in this report section and more detailed descriptions are provided on the individual test pit logs included as Appendix D. Previous test pit logs, boring logs, and cone penetrometer tests related to the earlier limited Phase II ESA are provided in Appendix E.

It is important to note that this additional Phase II ESA focused on identifying the locations of wastes, waste characterization, and to the extent possible, waste delineation. Geologic contacts differentiating subsurface materials on the individual test pit logs are only an interpretation of observed subsurface conditions. Since the purpose of this Phase II ESA was primarily to characterize and delineate wastes at the site; the investigation did not focus on classifying subsurface soils/materials. Generalized descriptions of the fill and alluvium encountered as indicated on the individual test pit logs (Appendix D) are based solely on cursory visual observations. Geotechnical testing for purposes of classification of soils/materials was not conducted as part of this investigation and for this reason, and those stated previously, this report is not intended to be used as a geotechnical evaluation report.

9.2.1 Undocumented Fill and Undocumented Fill + Wastes

The fill soils generally consist of light brown and brown, moist, very loose to medium dense, silty sand, clayey sand, poorly graded sand with silt, poorly graded sand with clay, poorly graded sand, well-graded sand with silt, and sandy silt, and brown, moist, soft to firm, lean clay. The fill contains various amounts of gravel and cobbles. Fill soils were observed to be overlying alluvium at locations where wastes were not observed, overlying construction wastes, or overlying some construction wastes and primarily burned wastes.

Two distinct types of wastes were observed at the site:

Construction Wastes - What is generally referred to as construction wastes were observed to consist primarily of concrete and asphalt, and lesser amounts of metal debris, bricks, bottles, glass, ceramics, plastic, and tires mixed with fill soils. These wastes are most common at the site.

Burned wastes - at three locations, test pits, TP-7, TP-10 and TP-21 burned wastes were encountered and typically consist of darkly colored ashy soils with abundant broken glass, fused and melted glass, metal debris and other wastes typical of sites where wastes were burned. At locations where the burned wastes were observed, they appear to underlie some construction wastes. The burned wastes appear to continue easterly offsite where they likely underlie the baseball fields.

Wastes depths were relatively consistent at the site, typically extending to maximum depths of 5 to 7.5 feet bgs (most commonly 6 to 6.5 feet bgs), based on locations explored.

At locations where wastes mixed with fill soils are present, it appears that for the most part, the wastes are adequately covered, typically with approximately 1.5 to 3 feet of cover soils. Some occasional or minor wastes were observed at/near the surface.

Wastes were observed mixed with fill soil at previous borings B-1, B-2, P-1 (minor scattered amounts), P-3, and P-5, and previous test pits TP-3 through TP-6. During this additional assessment, wastes were observed in test pits TP-2, TP-3 and TP-5 (minor scattered amounts), TP6, TP-7, TP-9, TP-10, TP-11, TP-16 (minor scattered amounts), TP-18, TP-19, TP-21 and TP-22 (minor scattered amounts) (Figures 4 and 5).

In general, it appears that wastes were not observed at the northern approximately 1/3 of the site with the exception of previous boring P-3 and previous test pit TP-3.

9.2.2 Alluvium

Each test pit excavated for this additional Phase II ESA were excavated into alluvium as confirmed in the field by Ninyo & Moore, as well as by LEA and CDM Smith staff that were in the field and observing the investigation. During this additional Phase II ESA, alluvium was encountered beneath the undocumented fill and wastes at relatively consistent depths of 5 to 7.5 feet bgs and was generally encountered at shallower depths at locations where wastes were not observed. Based on the previous geotechnical evaluation, the alluvium generally consists of interbedded light brown and brown, moist, loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, and sandy silt. The alluvial deposits contain variable amounts of gravel and cobbles.

9.3 Groundwater

The site lies within the Coastal Plain of the Los Angeles Basin of the South Coast Hydrologic Region and is situated approximately 0.9 miles east of the present location of Tujunga Wash (DWR, 2003), which is an alluvial channel that historically migrated across a fairly large area of the San Fernando Valley. The California Division of Mines & Geology (CDMG, 1997) indicates that the historic high depth to groundwater at the site ranges from approximately 110 to 120 feet bgs. Ninyo & Moore reviewed available information pertaining to groundwater in the site vicinity on the State Water Resources Control Board (SWRCB) GeoTracker website. Based on the website, it appears that the closest site with available groundwater depth information is approximately 0.5 miles to the northwest, at 12858 Roscoe Boulevard. According to an Additional

Site Assessment Report dated July 13, 2012, for this site (Shell Service Station) prepared by Wayne Perry Inc., (Wayne Perry Inc., 2012), groundwater was encountered at a depth of approximately 130 feet bgs in soil boring B-7 at the property in July 2010. In May 2012, a groundwater monitoring well was drilled and it was reported, *"Depth to first saturation in the boring was observed at approximately 194 feet, however the well was dry on June 4 and 14, 2012."* The depth to groundwater in a Los Angeles County groundwater monitoring well (Well ID 4898) located 800 feet southeast of the site was approximately 307 feet in 2009 (the latest posted measurement) (COLA, 2020). The depth to groundwater in this well ranged from approximately 204 and 335 feet from 1975 to 2009. It is anticipated that the current depth to groundwater at the park is similar to the groundwater depth information provided in this report section.

According to the Upper Los Angeles River Area Watermaster Groundwater Pumping and Spreading Plan 2002-2007 Water Years, groundwater in the site vicinity is reported to flow south, following regional topography (ULARAW, 2003).

During the previous Limited Phase II ESA , the geotechnical evaluation, and this additional Phase II ESA, groundwater was not encountered in the test pits or borings to depths of 71 feet bgs during drilling or during the percolation testing that included leaving borings open for 47 days. Groundwater levels, gradient, and flow direction can fluctuate due to seasonal variations, groundwater withdrawal or injection, changes in land use, and other factors.

10 SCOPE OF WORK

The scope of work for this additional Phase II ESA was based on limited background information, primarily interpretation of historical aerial photographs, objectives of the planned Construction Project, and the previous limited Phase II ESA and geotechnical study. In general, the following scope of work was performed:

- Confirmed on site access for the planned additional Phase II ESA activities to ensure subcontractors had permission to access the site. LADPR granted access to the park to conduct the investigation. Ninyo & Moore and Innovative Construction Solutions (ICS), (excavation subcontractor) staff arranged for the gate on Whitsett Avenue to be unlocked for equipment and workers to access the site.

- Notified and coordinated with LEA staff the additional Phase II ESA schedule prior to conducting the fieldwork. LEA staff was at the site during most of the additional Phase II ESA.

- Notified Underground Service Alert (USA), a public utility locator, of the upcoming Phase II ESA area so that they could contact representatives of utility companies in the area.

- Retained Atlas Technical Consultants, LLC, (Atlas) who has a licensed geophysicist on staff, to conduct a geophysical survey. The purpose of the survey was to assist with delineating the lateral (and vertical as possible) extent of wastes.

- Retained a licensed, qualified, and experienced excavating contractor (ICS) to provide equipment and a 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) trained operator to excavate/backfill exploratory test pits and a 40-hour HAZWOPER trained technician to provide assistance and dust control, as needed.

- Provided an experienced California-registered Professional Geologist (PG) to observe exploratory test pit excavations, spoils, and sidewalls, collect samples, and document observations and sample locations with photographs and on individual logs. The individual test pit logs include the depths/locations, types, and estimated percentages of wastes and cover, if present, based on field observations.

- Backfilled each test pit by placing the excavated materials from that location back into the test pit in the approximately reverse order that they were removed and generally tamping the materials with the bucket and then using the trackhoe excavator for additional compaction and to generally level the disturbed surface in the area of the excavation

- Submitted discrete samples for analytical testing to Enthalpy Analytical (Enthalpy), a California accredited analytical testing laboratory following standard chain-of-custody protocols.

- Documented field activities on individual test pit logs, air monitoring forms, chain of custody forms, and with photographs.

- Performed worker air monitoring/field screening during excavating/sampling and backfilling consistent with the Site Health and Safety Plan. Field screening of each test pit excavation and backfilling activities was conducted using a 5-gas meter that monitored lower explosion limit (LEL), oxygen, hydrogen sulfide, and carbon monoxide, and VOC readings for health and safety. The readings were recorded to document conditions (see Appendix F).

- Identified each test pit location on the field aerial photograph base map, obtained Global Positioning System (GPS) location coordinates of each test pit location, and obtained test pit orientation and length.

- Conducted fieldwork in accordance with applicable regulatory guidelines/requirements and consistent with the LEA-approved work plan.

- Performed data analysis, quality assurance/quality control, and compilation of environmental field and laboratory data.

- Prepared this additional Phase II ESA report that summarizes field activities, findings of the additional site investigation and provides conclusions related to waste disposal at the site and offsite areas. The report includes photographs, test pit logs, laboratory analytical reports, and relevant background data.

11 DEVIATIONS FROM THE WORK PLAN

There were no notable exceptions/deviations to the LEA-approved work plan.

12 PHASE II ENVIRONMENTAL SITE ASSESSMENT

The Phase II ESA was generally conducted in accordance with the LEA-approved work plan. The following sections describe the additional Phase II ESA.

12.1 Work Plan Approval, Site Access, Permits, and Notifications

The work plan for the additional Phase II ESA was submitted to the LEA who reviewed the plan and also forwarded it to CalRecycle for their review and comments. The LEA and CalRecycle both reviewed the work plan, and to expedite the project, the LEA in an email dated April 20, 2021 (Appendix A) stated, *"The LEA has no problems with you going ahead with the Phase II investigation of the Strathern Park North Site."* The email included recommendations to possibly contact other regulatory agencies and indicated that they had received comments from CalRecycle about the work plan and the planned Construction Project. The LEA provided a formal work plan approval letter dated April 22, 2021, included in Appendix A. The work plan was approved by the LEA, without conditions for conducting the Phase II ESA.

Property access was obtained by Ninyo & Moore and ICS to conduct the additional Phase II ESA. LADPR each morning opened the locked gate on Whitsett Avenue, to allow access to the site. Each day after completing the field work, the gate was locked to secure the site.

Permits from regulatory agencies were not required for the exploratory test pits.

The LEA, CalRecycle, LABOE, and the LADPR were notified of the planned Phase II ESA fieldwork as soon as the schedule was established. LEA staff was at the site during most of the field investigation and provided regulatory and investigation assistance.

12.2 Site Safety

An updated site-specific worker health and safety plan (SHSP) dated April 23, 2021 was prepared by Ninyo & Moore and used during field activities (Ninyo & Moore, 2021b). The plan indicated the required specific training and monitoring requirements to ensure workers are adequately protected, identified the potential chemical and physical hazards that may be encountered during the field activities and was prepared in compliance with Occupational Safety and Health Administration (OSHA) requirements. The plan addressed field procedures, personal protective equipment, anticipated contaminants, and established action levels for exposure to contaminants and contingency plans for emergencies that may arise during the fieldwork. The plan also addressed worker safety associated with planned field activities and provided requirements pertaining to the Site Safety Officer (SSO) during fieldwork. Air monitoring/field screening was conducted to comply with the SHSP.

Prior to beginning fieldwork each day, the SSO conducted a tailgate meeting and discussed the general scope of work that would be conducted that day and highlighted key safety features of the plan. Site workers read and signed the SHSP, acknowledging their familiarity with its

provisions and commitment to adhering to its requirements. The SHSP was implemented during fieldwork and a copy of the plan was available in the field in the Ninyo & Moore field vehicle. No emergencies arose during fieldwork.

12.3 Community Health and Safety Plan

A Community Health and Safety Plan (CHSP) was not required by the LEA.

12.4 Site Utility Clearance

Underground Service Alert (USA), a public utility locator that contacts utility companies that may have potential underground utilities or structures in the investigation area, was notified as required by law. Emails were received by various utility companies confirming that they did not have utilities at the site.

12.5 Geophysical Survey

On April 27, 2021, Atlas conducted a geophysical survey of the site; a copy of their report is included as Appendix C. Their survey was accomplished by collecting magnetic (MAG) and electromagnetic (EM) data to evaluate the areal extent of wastes and subsurface anomalies. The MAG and EM were used in conjunction to evaluate soil conductivity and the presence of subsurface metallic objects, potentially related to the lateral extent of waste debris.

Magnetometer data was collected at the site in order to assess the presence of ferromagnetic metals and the results are presented on Figure 3a of the geophysical report and Figure 6 of this report, using both contour lines and a color gradient image in gammas. The magnetometer measures the strength of the earth's magnetic field in units of gamma. Typically, relatively significant features are revealed in the MAG data as red/pink and blue/purple. The orange and yellow areas likely represent smaller objects.

The EM data was collected within the study boundary limits using a Geonics EM31-MK2 terrain conductivity meter in order to assess the presence of conductors and non-conductors in the subsurface. There are two components of the magnetic field that are measured by the EM31: the quadrature-phase (QP) and the in-phase (IP) components Both the QP and IP results are presented using contour lines and a color gradient image. Typically, relatively significant features are revealed as significant variations from the background values. In the IP results, high values are shown as red/pink colors and low values are shown as blue/purple colors. Typically, in the QP results blue/purple represent low conductivity (high resistivity) values and red/pink represent high conductivity (low resistivity) values. Figures 3b and 3c of the geophysical report summarize the EM results.

The geophysical report provided the following summary of findings/conclusions:

"The results of the MAG evaluation are illustrated in Figure 3a using both contour lines and a color gradient image in gammas. Relatively significant features are revealed in the MAG data as hot (red/purple) and cool (blue) colors. The results of the MAG data displayed several areas of high and low magnetic responses. These responses did not indicate a clear lateral landfill limit; however, the eastern portion of the site displays an anomalous area of concentrated high and low magnetic responses. This anomalous area may be related to landfilled material and/or zones of subsurface ferrous objects/materials; however, the exact cause and/or nature of this response in not known. Within this area, there appears to be an unidentified line that terminates towards the central portion of the site. Additionally, there appears to be an area of low magnetic response in the southern-most corner of the site. The cause and/or nature of this response is not known. It should be noted that the MAG data revealed several strong high and low magnetic responses boarding the site adjacent to the chain link fence; these are likely the result of surficial metallic objects such as chain link fencing, parking stops, baseball equipment and/or unidentified lines. However, these surficial features could mask subsurface debris and/or landfilled materials."

Burned wastes were observed at the eastern site area which also was the location of a chain link fence and other possible interferences as was mentioned in the geophysical report. However, as stated, the MAG results could also be related to the burned wastes which typically contain significant amounts of metallic debris. Figure 6 of this report is an overlay of the MAG data onto a recent aerial photograph showing the exploratory locations for this additional Phase II ESA and the previous limited Phase II ESA and geotechnical study.

"The results of the EM31 QP evaluation are illustrated in Figure 3b using both contour lines and a color gradient image in millimhos per meter (mmho/m). The cool colors (blue) represent lower conductivity values, whereas the warm colors (red/pink) represent higher conductivity values. The results of the QP data revealed a distinct regional change in values across the study area. Specifically, the northern portion of the site contained an area of lower conductivity materials, which appears to extend towards the central portion of the study area. The southern portion of the site has a more conductive response (Figure 3b). The exact cause and/or nature of these responses is not known; however, they could be related to changes in fill conductivity or moisture content. Additionally, there is a higher conductivity response along the perimeter of the study area. This response appears to be the effect of the chain link fencing and other surface metallic objects. The results of the EM31 IP evaluation are illustrated in Figure 3c using both contour lines and a color gradient image in parts per thousand (ppt). The cool colors (blue) represent lower values, whereas the warm colors (red/pink) represent higher values. The results of the IP data revealed a very subtle change in the central and southern portion of the study area. The scattered low amplitude responses in the central and south portions of the site appear to correlate well with the area of concentrated high and low magnetic responses in the MAG data (Figure 3a). The exact cause and/or nature of this response is not known; however, could be related to landfilled materials. Additionally, there appears to be a concentrated area of high and low responses in the southern-most corner of the site. This anomalous area correlates well with the results of the MAG and EM31 QP data (Figure 3a and 3c). The exact cause and/or nature of this response is not known.

In conclusion, the results of the MAG and EM31 IP evaluations appear to correlate well. They reveal an anomalous area of high and low magnetic responses in the eastern portion of the site and could be related to shallow buried metallic objects and/or landfilled materials. As previously discussed, the results of the EM31 QP data display a distinct regional change in conductivity. The northern portion of the site contains an area of lower conductivity values that extends towards and gradually becomes more conductive near the southern portion of the study area. The cause

and/or nature of this response is not known; however, it could be related to changes in soil conductivity and/or moisture content. Additionally, there appears to be an anomalous area in the southern-most corner of the site that is present in the MAG, QP, and IP results. The cause and/or nature of these responses are not known."

12.6 Test Pit Excavations

The exploratory test pits were located to as best as possible in the amount of time allotted for the project, to further evaluate wastes at the site. Wastes were characterized and delineated at the site; however, as previously indicated, this Phase II ESA confirmed that the lateral extent of wastes extends beyond the site boundary. In general, exploration locations were selected based on the following:

- Select historical aerial photographs indicating the locations of surface disturbances that may be related to waste disposal.
- Results of the previous limited Phase II ESA and the geotechnical study (Ninyo & Moore, 2020 b, c) indicating locations that were previously explored and at each location, whether wastes were present or absent.
- Locations where additional investigation appeared to be needed to delineate the lateral extent of wastes (e.g., locations where there were data gaps).
- To as best as possible in the time allotted, cover most of the site area and to as best as possible, characterize and delineate the wastes at the site.

On April 27 and 28, 2021, a total of 22 exploratory test pits were excavated to further evaluate subsurface wastes at the site. Test pits were located and oriented to obtain the maximum information about the extent of the wastes based on current site conditions, background information (historical aerial photographs and reports/figures) indicating suspected locations of where wastes are likely to be present. Test pits were located at areas suspected of containing wastes as well as outlying areas to prove their suspected absence.

An authoritative protocol was used during the investigation (e.g., adjusting the locations of exploratory test pits based on information obtained during the investigation) to maximize the amount of information obtained during the additional Phase II ESA and to take into account the evolving conceptual site model. Some of the exploratory test pit locations were adjusted to take into account findings of the investigation. Test pit locations were also selected to fill in data gaps or to better define the lateral extent of wastes.

Each test pit was logged by an experienced California-registered Professional Geologist (PG). Test pit locations were recorded using a cell phone GIS application and also on the field map. Each log indicated the subsurface materials encountered. The test pits only remained open long enough to log,

collect samples, and document the excavation and subsurface conditions on individual test pit logs and with photographs.

Excavation equipment was operated by an experienced OSHA 40-hour HAZWOPER certified operator. A trained and similarly certified assistant helped with directing excavation and backfilling, and controlled dust by applying water, when required and as possible. Excavations that encountered wastes were extended to depths interpreted to be into the underlying formation (alluvium) and the excavation typically extended approximately 1 to 2 feet deeper.

If wastes were not observed, the test pit excavation generally continued to depths adequate to confirm their absence and the presence of formation. In general, each test pit was excavated to a depth adequate to confirm the absence of wastes, and/or adequate to evaluate the depth of wastes, if present.

During excavation, test pit spoils were generally placed a minimum of 2 feet from the test pit excavation and in such a manner that the materials were prevented from falling back into the excavation. To the extent possible, during excavation, apparently *"clean"* soils were placed on one side of the excavation. Wastes mixed with soils, if encountered, were placed on the opposite side of the test pit to prevent commingling with other excavated material.

12.7 Sampling and Handling

Two to five samples were collected at each test pit excavation; the actual number depended on the depth of the excavation and subsurface materials encountered. At each location, one sample was collected at and or near to the surface. Typically, one additional sample was collected of the underlying formation (alluvium) from test pits where wastes were not encountered. At locations where wastes were encountered, one to several samples were typically collected of the wastes, depending on waste types and thickness, and a sample was collected in the underlying formation (alluvium).

Samples collected in wastes such as concrete, asphalt, bricks, etc., are not conducive to sampling and require the soils around these waste materials to be sampled as opposed to the actual wastes. Burned wastes can be directly sampled.

Samples were collected by coring the laboratory-supplied glass sample jar directly into the material to be sampled. For samples collected at the surface/near surface, the sample jar was typically cored directly into the excavated surface. For samples collected at greater depths, the sample jar was cored directly into the relatively intact soil and/or wastes and/or formation mass

brought to surface in the excavator bucket. Each time a sample was collected, the sampler used a new pair of disposable gloves to prevent potential cross contamination.

Each glass sample jar was immediately labeled to ensure proper identification for tracking by the analytical testing laboratory. Each jar was labeled with test pit identification, sample depth, date, and time the sample was collected, and project location and number. Sample jars from each test pit excavation were additionally placed into separate zip-lock ® plastic bags and labeled with the test pit sample identification. Samples were immediately placed into laboratory-supplied coolers, chilled with ice.

The chain-of-custody forms were completed for each sample at the time of collection and were maintained until samples were delivered to Enthalpy Analytical in Orange, California following completion of the field work. Chain-of-custody documentation recorded the description, possession, condition, and transfer of samples.

12.8 Excavation Backfilling

Following logging, sampling and documentation, each test pit excavation area was generally restored to the extent practical, to near its original condition, by backfilling with excavated materials from only that location. Each test pit was backfilled in the approximate reverse order in which it was excavated. Excavations were backfilled shortly after excavation and no excavations remained open overnight. The excavation equipment operator pushed the backfilled materials back into excavation and generally compacted the excavation in a typical manner using the bucket and/or driving over the excavation with the trackhoe. Surface and near surface disturbance of adjacent areas, such as ruts created by excavating and related equipment and vehicles, were mostly smoothed out, as practicable, to match the surrounding ground surface.

12.9 Air Monitoring

During the investigation, air monitoring was performed in general accordance with the SHSP (Ninyo & Moore, 2021b). Mitigation measures were implemented that controlled air pollution and dust, and included suppression by water spraying active work areas and excavated wastes as required and minimizing the waste drop height from the excavator's bucket onto the temporary excavated waste stockpiles.

During field activities, air monitoring was conducted by Ninyo & Moore staff to document that workers in the immediate vicinity of the excavation activities were not exposed to concentrations of constituents of potential concern (COPC) exceeding the action levels indicated in the SHSP. Air monitoring data was obtained and recorded in the breathing zone using a 5-gas meter for the

lower explosive limit (LEL) relative to methane, hydrogen sulfide, carbon monoxide, oxygen and volatile organic compounds (VOCs). The air monitoring readings did not exceed action levels, indicating site workers were not exposed to COPC (Appendix F).

12.10 Equipment and Materials Decontamination

To reduce potential cross-contamination, equipment or any item that may have come into contact with sample material was cleaned or obtained in an unused condition from the manufacturer/analytical laboratory before use at each sampling location. A new pair of disposable nitrile gloves was worn by the sampling staff each time a sample was collected and samples were collected directly into the laboratory-supplied glass jar reducing the potential for cross-contamination.

12.11 Field Documentation

As previously indicated, each test pit was logged by an experienced California-registered PG and test pit locations were recorded and coordinates of the approximate center location of each test pit was obtained as well as the general orientation using cell phone based GIS applications. This information was also recorded on the field map.

Each test pit log included a drawing of the test pit and indicated length, total depth excavated, subsurface materials encountered/lithologic/waste contacts, sample locations and depths and other relevant information. Waste descriptions included types and typically estimated percentages of wastes mixed with fill soils based solely on field observations. Cover soils, if present, were described and thicknesses recorded. The base of the waste depth was recorded on the logs. Each test pit and spoils were further documented with photographs.

At each test pit location, photographs were taken to document subsurface conditions, and investigative activities. Photographs documenting the test pits included the excavation and spoils. The photographs supplemented information contained in the individual test pit logs. Photographs included information identifying the test pit and date (Appendix D).

13 ANALYTICAL TESTING

The Phase II ESA consisted of additionally evaluating wastes at the site, more specifically, characterizing and delineating wastes, cover soils, (as applicable) and fill and formation/alluvium underlying/outlying wastes. There was no available background information pertaining to past waste disposal operations at the time of the additional Phase II ESA and available information from the earlier limited Phase II ESA and geotechnical evaluation did not indicate the presence of

burned wastes based on the locations explored, which usually results in elevated metal concentrations, typically lead. The previous limited Phase II ESA and geotechnical evaluation indicated that wastes encountered onsite typically consist of concrete, asphalt, bricks and lesser amounts of plastic, glass, and ceramic debris, bottles, and tires based on locations explored.

Based on this additional Phase II ESA, the majority of wastes at the site at locations explored are construction wastes typically consisting of concrete, asphalt, metal debris, and lesser amounts of other miscellaneous construction materials (tile, cinder blocks, bricks, etc.) and small amounts of other waste debris such as glass bottles and broken glass, and plastic. However, at three locations, at the eastern site area, burned wastes were encountered in the test pits and likely continues easterly into the existing playing fields.

Based on the waste types, and the analytical results of the previous limited analytical testing of the wastes, samples from this additional Phase II ESA that were assigned testing, were analyzed for Title 22 metals or lead only. At the three locations where burned wastes were encountered, some additional samples were collected of this waste type for additional metals analytical testing as this waste type typically contains elevated metal concentrations, particularly lead. Analytical results of previously tested waste samples from the site indicated some elevated lead concentrations and the presence of a few organochlorine pesticides (OCPs), polychlorinated biphenyls (PCB), semi volatile organic compounds (SVOCs), and some low petroleum hydrocarbon concentrations. Therefore, select samples, typically those that appeared to be at locations with the most amount of wastes, and the burned wastes, were analyzed for other COPCs in addition to metals. Volatile organic compounds (VOCs) were not detected in the samples previously analyzed.

As previously mentioned, except at locations where burned waste was encountered which is conducive to directly sampling, other samples collected in construction wastes (e.g., concrete, asphalt, etc.) which is not conducive to sampling, requires the soils around these waste materials to be sampled as opposed to the actual wastes.

The following analytical testing was conducted based on background information, particularly results of previously tested waste samples; experience conducting similar waste disposal site investigations statewide; and the types of wastes observed during the investigation.

Total metal concentrations (Title 22 metals) or total lead only by United States Environmental Protection Agency (EPA) test methods 6010B/7471A and 6010B, respectively. Metals are a common COPC at most waste disposal sites, particularly at sites where wastes were burned. Samples assigned analytical testing were analyzed for Title 22 metals or lead only analysis.

Soluble metal concentrations (specific Title 22 metals) select samples containing individual total metal concentrations exceeding 10 times their respective Soluble Threshold Limit Concentration (STLC) were additionally analyzed for STLC and select samples containing individual metal concentrations greater than 20 times their respective STLC were additionally analyzed for Toxicity Characteristic Leaching Procedure (TCLP). A sample containing the highest total lead concentration at the site based on samples collected and analyzed, was additionally analyzed for STLC and TCLP lead.

Total petroleum hydrocarbons (TPH) carbon chain identification (C_6-C_{44}) by EPA test method 8015M. Several waste samples previously analyzed contained some relatively low concentrations of petroleum hydrocarbons. For this additional Phase II ESA, 13 samples, typically those generally containing the most amount of observed wastes, were analyzed for TPH as gasoline range organics (GRO), diesel range organics (DRO) and oil range organics (ORO).

Polychlorinated Biphenyls (PCBs) by EPA test method 8082. PCBs are often present at waste disposal sites and were previously detected in some wastes at the site. Six samples, typically from locations containing the most amount of observed waste were analyzed for OCPs.

Semi-Volatile Organic Compounds (SVOCs) by EPA test method 8270C. SVOCs are often present at waste disposal sites, particularly at sites where wastes were burned. Eight samples, those generally from locations containing the most amount of observed wastes were analyzed for SVOCs.

Volatile Organic Compounds (VOCs) by EPA test method 8260B. VOCs are often present at waste disposal sites; however, none of the previous samples analyzed contained detectable VOCs. Based on this and the waste types, five samples, those generally from locations containing the most amount of observed wastes were analyzed for VOCs.

Organochlorine pesticides (OCPs) by EPA test method 8081A. OCPs are often present at waste disposal sites, particularly at locations where current or previous site uses were agricultural. Six samples, typically from locations containing the most amount of observed wastes were analyzed for OCPs.

Table 1 summarizes the analytical testing, test method and number of samples analyzed.

Table 1 – Analytical Testing

Constituents of Potential Concern (COPC)	EPA Test Method	Number of Samples
Title 22 metals	6010B/7471A	33
Total lead only	6010B	18
Total Petroleum Hydrocarbons (TPH)	8015B	13
Polychlorinated Biphenyls (PCBs)	8082	6
Semi-Volatile Organic Compounds (SVOCs)	8270C	8
Volatile Organic Compounds (VOCs)	8260B	5
Organochlorine Pesticides (OCPs)	8081A	6
Soluble Testing (STLC, TCLP)	6010B	12

Notes:
The samples selected for additional metals analyses and testing were typically those observed to contain the most amount of wastes based solely on field observations during the additional Phase II ESA.

14 QUALITY ASSURANCE/QUALITY CONTROL

Data validation associated with the analytical testing included evaluating the following:

- Sample holding time.

- Sample methods.
- Analytical method.
- Sample preservation.
- Chain-of-custody records.
- Detection limits.
- Possible transcription errors.
- Surrogate recoveries.
- Matrix spike recoveries and matrix spike duplicate recoveries.
- Calibration checks.

Field duplicates generally involve collecting two separate samples of the same matrix at the same time and same location, and using the same sampling procedures to document that sampling techniques are consistent and are not influencing the analytical results. However, burned wastes are inherently heterogeneous, therefore, even if two samples are collected in the same exact manner and side by side, the analytical results will often be different and may not be comparable because the wastes or materials that compose the fill are inherently different. Field duplicates of wastes are therefore not a reliable indicator of accuracy, representativeness, or precision and were therefore not collected.

A trip blank consists of a sample of deionized water provided by the laboratory that is kept with samples to be analyzed for VOCs, after sample collection and during transport to the laboratory. Waste samples collected as part of this investigation are solid, not liquid samples; therefore, trip blanks are not applicable to this investigation. The proposed sample collection methodology does not require using sampling equipment; therefore, equipment blanks are not required.

Based on the analytical report, it appears that there were no problems noted with the analytical testing and the results and the analytical data can be relied upon.

15 SITE RESTORATION AND MANAGEMENT OF INVESTIGATIVE DERIVED WASTE

After completion of field activities, each area investigated was left in an orderly condition with equipment, unused materials, and other miscellaneous items resulting from, or used in, the investigation removed from the site. Excavated materials were placed directly back into the excavation from which they were removed. Used personal protective equipment (PPE) (e.g., sampling gloves) were bagged and disposed of in a municipal refuse dumpster.

16 SUMMARY OF FINDINGS

The following summarizes the findings of the additional Phase II ESA:

16.1 Test Pit Logs

The following information was recorded on individual test pit logs included in Appendix D:

- Project name and number.
- Sample locations and depths, a unique test pit identifier was used (TP22-6) indicating test pit 22 and a sample collected at a depth of approximately 6 feet bgs.
- Date test pit was excavated/backfilled.
- Name of person logging and sampling the excavation.
- Depths and locations of samples collected; the logs indicated total depth excavated; depth of cover soils (if present) and wastes and formation (alluvium), as applicable.
- Descriptions/visual classification of subsurface materials encountered, based solely on observations, including:
    - General descriptions of cover soils overlying the wastes (as applicable).
    - General descriptions of subsurface materials (e.g., fill, wastes, formation; and typically an estimated percentage of wastes relative to fill soils based on visual observations and a general description of the primary constituents of the wastes (e.g., concrete, metal, glass, etc.).
    - Lithologic descriptions of the underlying formation (alluvium).

16.2 Waste Disposal Site History

There do not appear to be available records pertaining to waste disposal activities at the Strathern Park North (site) and the LEA reported that they were unaware of wastes at this property. Prior to the preparation of this Phase II ESA, the waste disposal site was not listed in the SWIS database meaning that it was not a known and/or documented waste disposal site. However, we were informed by CalRecycle staff on July 29, 2021, that the site was added to the SWIS database and assigned SWIS #19-CR-0835. There are numerous undocumented waste disposal sites similar to this site, statewide and it has been our experience that parks are often locations of previous waste disposal sites. The park (or a portion of the park) and possibly other locations extending offsite, including residential properties, appear to be the location of an undocumented, pre-regulations waste disposal site.

Historical aerial photographs were relied upon to assist with evaluating historic waste disposal activities particularly because there was an absence of other documentation about the site. Review and interpretation of the 1952 and 1953 historical aerial photographs suggest that prior to 1952, and sometime after 1947, the eastern area of the park corresponding to the existing baseball fields appears to be the location of significant surface disturbances that are likely the location of waste disposal activities. An unpaved road originating from the eastern park area in

the vicinity of structures continues onto the site and appears to terminate at a location interpreted to be a large stockpile of material. There are other areas of what appear to be highly disturbed areas stockpiled with rows of materials on site which are interpreted to be related to waste disposal which appears to be more concentrated at the eastern portion of the park area. These surface disturbances/waste disposal activities appear to have occurred prior to construction of the SR-170 freeway.

Although not known, the surface disturbances that appear to be related to waste disposal activities both on and offsite to the east (e.g., at Strathern Park) may be related in part to residential construction projects in the area. The presence of a structure offsite at the eastern area of the future park that appears to be accessed via Whitsett Avenue with unpaved roads that extend from the structure to disturbed areas on and offsite corresponding to most of Strathern Park North suggests that the site and eastern area may have been a more formal waste disposal site. The 1967 photograph indicates the site is the location of significant surface disturbances that appear to be unpaved roads and possibly stockpiled materials. Although not clear, the 1953 aerial photograph indicates similar surface disturbances to the south of the park, possibly extending into future Strathern Street and to the south into Jamie Beth Slaven Park, which may also be the location of past waste disposal activity.

In summary, it appears that surface disturbances at the site and offsite at the eastern developed park area (and possibly continuing beyond the park), suspected to be related to waste disposal activities, began sometime after 1947 and prior to 1952. It appears waste disposal activities may have stopped by 1964; however, the 1967 aerial photograph indicates significant surface disturbances at the site in 1967. The site was graded by 1970.

The locations/areas of surface disturbances observed in some of the historical aerial photographs that are suspected to be related to former waste disposal activities appear to be in locations where wastes were observed during the previous Phase II ESA and geotechnical evaluation, and this additional Phase II ESA.

16.3 Phase II Environmental Site Assessment

On April 27 and 28, 2021, 22 exploratory test pits were excavated at the site and were used to characterize and delineate wastes.

Test pits were located and oriented to obtain the maximum information about the extent of the wastes, locations were generally consistent with the LEA-approved work plan, and based on the following:

- Current site conditions and planned Construction Project layout at this time.
- Historical aerial photographs indicating the locations of surface disturbances that were interpreted to be related to waste disposal.
- To as best as possible in the time allotted, cover most of the site area.
- To fill in data gaps from the previous limited Phase II ESA and geotechnical study and/or to better define the lateral extent of wastes.

Authoritative protocol was used during the investigation (e.g., adjusting the locations of exploratory test pits based on information obtained during the investigation) to maximize the amount of information obtained during the additional Phase II ESA and to take into account the evolving conceptual site model.

16.4 Analytical Results

Analytical results were compared to hazardous waste criteria (when values were available), since the planned Construction Project will involve excavating the wastes as part of the design of the infiltration gallery, and offsite disposal of the wastes to an appropriate waste disposal facility/recycling facilities. However, since it is anticipated that some wastes will be remaining at the site, at locations outlying the lateral extent of the infiltration gallery and at the developed park area to the east, analytical results were also compared to human health screening levels. Metals analytical results are summarized on Table 2 and analytical results of other COPCs are summarized on Table 3. Analytical reports and chain-of-custody documentation are provided as Appendix G.

Title 22 Metals

Only those metals detected at concentrations exceeding hazardous waste criteria and/or human health screening levels are discussed in this section.

Arsenic

The 33 samples were analyzed for total arsenic concentrations. Arsenic was detected in 27 samples at concentrations ranging from 1.1 to 23 mg/kg. The arsenic concentrations significantly less than the arsenic Total Threshold Limit Concentration (TTLC) of 500 mg/kg and less than 10 times the arsenic Soluble Threshold Limit Concentration (STLC) of 5 mg/L (50 mg/L); therefore, do not exceed hazardous waste criteria.

The arsenic concentrations of the 27 samples exceed human health screening levels for residential and industrial/commercial soils. However, based on conducting numerous similar waste disposal site projects statewide and the DTSC Acceptable Cleanup Level of 12 mg/kg for southern California soils, it is our opinion that only the two samples of burned wastes from test pits TP7 and TP10, with arsenic concentrations (19 and 23 mg/kg) greater than 12 mg/kg would likely be considered impacted by arsenic.

Copper

The 33 samples were analyzed for total copper concentrations. Copper concentrations ranged from 2.8 to 350 mg/kg. The sample containing 350 mg/kg was from test pit TP10 which is one of the locations of burned wastes.

Only one sample contained copper at a concentration (350 mg/kg) that exceeded 10 times the copper STLC of 25 mg/L (250 mg/L). Based on this, the sample was additionally analyzed for soluble copper and the copper STLC was 17 mg/L, less than the STLC of 25 mg/L. None of the samples analyzed contained copper at a concentration that exceeded the copper TTLC of 2,500 mg/kg.

Total copper concentrations did not exceed human health screening levels.

Lead

The 51 samples were analyzed for total lead concentrations (assigned as Title 22 metals or lead analysis only). Lead concentrations ranged from not detected in one sample from a location outlying wastes to 1,800 mg/kg in a sample of burned wastes.

The three test pits (TP-7, TP-10 and TP-21) with burned wastes contain the highest lead concentrations ranging from 76 to 1,800 mg/kg (excluding a sample of unknown cobalt blue waste material analyzed from test pit TP-7). One burned waste sample from each of these test pits was additionally analyzed for soluble lead. Soluble lead concentrations were 7.4, 17, and 18 mg/L, exceeding the lead STLC of 5 mg/L. Based on this, if the wastes are excavated and compared to hazardous waste criteria, they would be classified as California hazardous for lead. (The sample containing 1,800 mg/kg and 18 mg/L soluble lead would be classified as California hazardous for both total and soluble lead.)

One sample from test pits TP16, TP18 and TP19, where burned wastes were not observed contained total lead concentrations ranging from 57 to 110 mg/kg, exceeding 10 times the lead STLC of 5 mg/L (50 mg/L). Soluble lead concentrations of these samples additionally analyzed ranged from not detected to 0,53 mg/L, less than the lead STLC of 5 mg/L.

None of the samples analyzed contained total lead at a concentration that exceeded the lead TTLC of 1,000 mg/kg.

Total lead concentrations of burned waste samples from test pits TP7, TP10 and TP21 exceeded human health screening levels for residential soils and/or industrial/commercial soils. Total lead concentrations from soil samples from test pit TP16 exceeded human health screening levels for residential soils.

Zinc

The 33 samples were analyzed for total zinc concentrations. Zinc concentrations ranged from 11 to 3,900 mg/kg. The sample containing 3,900 mg/kg was from test pit TP21 which is the location of burned wastes and is outside the anticipated limits of project-related ground-disturbing activity.

Only one sample contained zinc at a concentration (3,900 mg/kg) that exceeded 10 times the zinc STLC of 250 mg/L (2500 mg/L). Based on this, the sample was additionally analyzed for soluble zinc, and the zinc STLC was 700 mg/L, greater than 250 mg/L. Based on the soluble zinc concentration, if the wastes are excavated and compared to hazardous waste criteria, this waste would be classified as California hazardous. There is no TCLP value for zinc.

None of the samples analyzed contained total zinc at concentrations that exceeded the zinc TTLC of 5,000 mg/kg.

Total zinc concentrations did not exceed human health screening levels.

Total Petroleum Hydrocarbons (TPH)

Total Petroleum Hydrocarbons - Gasoline Range Organics (TPH-GRO) was not detected in the 13 samples analyzed.

TPH - Diesel Range Organics (DRO) was detected in two of the 13 samples analyzed, both at a relatively low concentration of 16 mg/kg.

TPH – Oil Range Organics (ORO) was detected in four of the 13 samples analyzed at relatively low concentrations ranging from 22 to 50 mg/kg.

There are no listed hazardous waste criteria levels for petroleum hydrocarbons and concentrations of samples analyzed were less than human health screening levels for residential and industrial/commercial soils.

Polychlorinated Biphenyls (PCBs)

PCBs were not detected in the six samples analyzed.

Organochlorine Pesticides (OCPs)

Six samples were analyzed for OCPs.

One sample from test pit TP19 contained chlordane at a concentration of 290 ug/kg, less than the hazardous waste criteria TTLC of 2,500 ug/kg (2.5 mg/kg).

One sample from test pit TP7 of burned wastes, contained 4,4'DDD at a concentration of 5.1 g/kg and 4,4'DDE at a concentration of 600 ug/kg, less than the hazardous waste criteria TTLC of 1,000 ug/kg (1 mg/kg). One sample from test pit TP21 also of burned wastes, contained 4,4'-DDE at a concentration of 6.9 ug/kg, also less than the hazardous waste criteria.

One sample from test pit TP20 contained 26 ug/kg 4,4'DDE less than the hazardous waste criteria.

No other OCPs were detected in the samples analyzed.

OCPs were not detected at concentrations exceeding hazardous waste criteria or human health screening levels.

Volatile Organic Compounds (VOCs)

VOCs were not detected in the five samples analyzed.

Semi-Volatile Organic Compounds (SVOCs)

SVOCs were not detected in the eight samples analyzed.

Summary of Analytical Results

Analytical results indicate that the wastes at the site contain some elevated metal concentrations. As would be expected, the higher lead concentrations are related to burned wastes.

One sample of burned wastes from test pit TP-7 contains total lead at a concentration of 1,800 mg/kg and soluble lead at 18 mg/L, exceeding the lead TTLC of 1,000 mg/kg and the lead STLC of 5 mg/L. Two samples, one each from test pits TP7 and TP10, contain soluble lead at concentrations of 7.4 and 17 mg/L, exceeding the lead STLC of 5 mg/L. One sample of burned wastes from test pit TP-21 contains soluble zinc at a concentration of 700 mg/L, exceeding the zinc STLC of 250 mg/L. Based on this, if these wastes are excavated, they would be classified as California hazardous for lead and zinc. It should be noted, however, that test pits TP-7 and TP-21 are located east and outside of the anticipated area of the planned stormwater infiltration project. No other samples analyzed contain metals at concentrations exceeding their respective hazardous waste criteria.

Analytical results of alluvium underlying wastes and of fill soils/alluvium outlying wastes generally indicate that soils have not been adversely impacted by COPCs.

The requested STLC and TCLP analytical testing was intended to provide additional analytical results to assist with hazardous waste criteria support and to indicate that the subsurface wastes are not adversely impacting soils (e.g., soluble/migrating). However, the available total metal concentrations analytical results of underlying and outlying soils is actually better evidence that metals are not soluble/migrating from the wastes.

16.5 Nature and Extent of Wastes

The following information is provided about the nature and extent of wastes and cover soils based on this additional Phase II ESA and other background information.

At the locations explored, the wastes typically are approximately 4 to 5.5 feet thick. The base of the wastes is typically at depths of approximately 5.5 to 6.5 feet bgs; however, it ranges from approximately 5 to 7.5 feet bgs. Wastes did not extend to depths greater than approximately 7.5 feet bgs based on the locations explored.

16.5.1 Waste Types

Results of this additional Phase II ESA indicate that there are generally two distinct types of wastes at the site as follows:

Construction Wastes with Minor Amounts of Other Wastes

What is generally referred to as construction wastes were observed at the majority of the site where wastes were encountered. The wastes were observed to generally consist primarily of concrete and asphalt, and lesser amounts of metal debris, including a few large pieces of structural steel, bricks, cinder blocks, bottles, glass, ceramics, plastic, metal cans, and tires at the locations explored.

Burned Wastes

Burned wastes were encountered in three test pits, TP-7, TP-10 and TP-21, and typically consist of darkly colored ashy soils with abundant broken glass, fused and melted glass, metal debris and other waste debris (e.g., ceramic, porcelain, etc.), typical of sites where wastes were burned.

At locations where the burned wastes were observed, they generally appear to underlie the construction wastes, likely because the burned wastes are older.

16.5.2 Estimated Extents of Wastes

The estimated waste extent is based on a review of select historical aerial photographs indicating surface features/disturbances, some interpreted to be related to waste disposal; and results of this additional Phase II ESA and the previous limited Phase II ESA and geotechnical study indicating where wastes were observed and where they were absent. The locations of the construction wastes appear to generally correlate with the area that has been interpreted to be the location of possible dumping/mounded area, as noted best on the 1953 aerial photograph (Figure 5 and Appendix B). Wastes also extend beyond this mound area. Waste locations and the estimated extent based on exploratory locations are shown on Figures 4 through 6.

Burned wastes were encountered at the easternmost area of the site and in the central southern area of the site and likely extend easterly offsite into the developed area of the park. Based on interpretation of the 1953 aerial photograph and results of this additional Phase II ESA, it appears likely that burned wastes may also underlie the majority of the easterly developed area of the park. Although not known, it is possible that wastes continue offsite to the south into Strathern Street and possibly Jamie Beth Slaven Park, further south.

Wastes at the site were characterized and delineated. Based on the current planned construction project, approximately 15 to 20 feet of excavation will be conducted for the infiltration basin; therefore, wastes within the construction envelope should be entirely removed as part of the construction project based on the relatively consistent maximum waste depths, which are less than the anticipated construction depth.

Although not known, interpretation of historical aerial photographs and the results of this additional Phase II ESA and the previous limited Phase II ESA and geotechnical study suggest that the easterly developed park area may have been the main area of waste disposal activities and likely some or most of the wastes that are suspected to exist at that location were burned. Some of the burned wastes from the eastern park area appear to extend westerly onto the site. The site appears to have been mostly used for dumping of Construction Wastes; however,

burned wastes are present at the site. In general, it appears that wastes were not observed at the northern approximately 1/3 of the site with the exception of previous boring P-3 and previous test pit TP-3.

Waste Cover

The topography of the site indicates the area of wastes appears to be at a higher elevation than properties to the north (residential) and southwest (transmission line easement), which may be related to covering the wastes. Based on site observations and results of the test pits where wastes were observed, wastes in general appear to be adequately covered, typically with 1 to 3.5 feet of fill soils, typically without wastes. However, at a few locations, some minor amounts of waste debris are present in the cover soils.

17 RECOMMENDATIONS

The following recommendations are provided at this time:

- This Phase II ESA report should be submitted to the LEA, CalRecycle and the Los Angeles Regional Water Quality Control Board.
- As indicated in the April 22, 2021 work plan approval letter, the LEA is requiring that a WMP be prepared and implemented any time subsurface activities are conducted at Strathern Park North (a portion of which is the site) based on the park being the location of waste disposal. The LEA stated the WMP should include the entire park The WMP should be prepared and submitted to the LEA for their approval prior to beginning the Construction Project.
- Based on the presence of wastes at the site, including burned wastes, which are classified as California hazardous, the park was assigned SWIS #19-CR-0835 and was entered into the database. It is likely the park will be inspected by the LEA at a frequency to be determined by them and the waste disposal site will need to meet state minimum standards and comply with applicable portions of Title 27 CCR.
- As anticipated, the LEA stated that pursuant to 27 CCR 21190, a PCLUP will be required to be prepared and submitted to the LEA and CalRecycle for their approval prior to beginning the Construction Project. As stated by the LEA, the plan should reflect the findings of this additional Phase II ESA (as well as the previous limited Phase II ESA and geotechnical study).
- Staff at the park should be notified of the possible presence of burned wastes at the site and particularly that they are anticipated to exist in the area of the existing playing fields in the event that subsurface work such as irrigation system development or replacement or other activities require excavating into known or suspected wastes. Additional waste evaluation may be warranted in the area of the baseball fields. At a minimum, these fields as well as any other areas at the park that are not covered with pavement need to be inspected to assure that wastes, if present are not exposed at the surface. Inspection requirements and frequency would likely be addressed in the forthcoming PCLUP.
- The LEA is requiring construction of Landfill Gas (LFG) monitoring wells. Based on the site configuration and presence of adjacent residences, it is anticipated that two to three LFG wells will be required at the site, one to the north and the other to the east and possibly one waste

LFG well in the eastern developed area of the park. Based on the waste depth, the LFG wells can be single completion wells to depths of approximately 10 feet bgs. The depth of the wells could change if a site investigation is conducted to the east and burned or other wastes are encountered at greater to depths. If a subsurface investigation is not conducted at the eastern developed area of the park prior to constructing the LFG wells, then the wells could be conservatively constructed to depths of approximately 15 feet bgs in the event that wastes, if present, extend to greater depths in this area of the park.

- The LEA recommended clean-closure (e.g., waste removal) within the construction project footprint and stated that if all of the waste cannot be removed, then the wastes that remain in place will need to comply with state minimum standards and long term maintenance and monitoring. Based on the current construction project design/layout, wastes are present beyond the lateral extent of the construction project and therefore a portion of the site and possibly also the eastern developed park area will be subject to state minimum standards, post closure operations and maintenance which will be addressed in the forthcoming PCLUP.

18 LIMITATIONS

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Variations in site conditions may exist and conditions not observed or described in this report may be encountered during subsequent activities. Please also note that this study did not include an evaluation of geotechnical conditions or potential geologic hazards.

Ninyo & Moore's opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analysis. Further assessment of potential adverse environmental impacts from past on-site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between sampling locations. Variations in soil and/or groundwater conditions will exist beyond the points explored in this evaluation.

The environmental interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and concentration of specific chemical or physical constituents in samples collected from the subject site. The testing and analyses have been conducted by an independent laboratory which is certified by the State of California to conduct such tests. Ninyo & Moore has no involvement in, or control over, such testing and analysis. Ninyo & Moore, therefore, disclaims responsibility for any inaccuracy in such laboratory results.

Our conclusions, recommendations, and opinions are based on an analysis of the observed site conditions. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

Notes:

bgs = below ground surface
EPA = United States Environmental Protection Agency
DTSC Acceptable Clean Up Levels - DTSC's Determination of a Southern California Regional Background Arsenic concentrations in soil (March, 2008)
DTSC HERO HHRA - Department of Toxic Substances Control Human and Ecological Risk Office Human Health Risk Assessment, Note 3, Recommended Screening Levels (June 2020)
ID = identification
mg/kg = milligrams per kilogram
mg/l = milligrams per liter
-- = sample not analyzed
J = estimated value
ND = not detected above the laboratory reporting limit
NL = not listed
RSLs = United States Environmental Protection Agency Regional Screening Levels, May 2020
STLC = Soluble Threshold Limit Concentration
TCLP = Toxicity Characteristic Leaching Procedure
TTLC = Total Threshold Limit Concentration by EPA Method 6010B/7471A

xxx the concentration exceeds one or more human health screening levels for residential soil
xxx the concentration exceeds one or more human health screening levels for industrial and/or commercial/industrial soil
the concentration exceeds the Total Threshold Limit Concentration and/or the Soluble Threshold Limit Concentration (Cal Haz waste)
the concentration exceeds the Toxicity Characteristic Leaching Procedure (Fed Haz Waste)

STORMWATER CAPTURE PARKS PROGRAM

Meeting to Discuss Phase II ESA (Environmental Site Assessment) at Strathern Park North

Location: Google Hangouts - Conference Call

Date: June 9, 2020

Time: 1:00 - 2:00 PM

Attendees:

Name	Organization	Email
Peter Tonthat	LADWP	peter.tonthat@ladwp.com
Darryl Ford	RAP	darryl.ford@lacity.org
Keith Gilbert	Ninyo & Moore	kgilbert@ninyoandmoore.com
Spencer Marcinek	Ninyo & Moore	smarcinek@ninyoandmoore.com
Beth Abramson-Beck	Ninyo & Moore	babramsonbeck@ninyoandmoore.com
Scott Dellinger	CDM Smith	dellingeras@cdmsmith.com
Larry Magura	CDM Smith	maguralm@comcast.net
Christopher Johnson	BOE/CWD	christopher.johnson@lacity.org
Bryan Powell	BOE/CWD	bryan.powell@lacity.org
Wirikit (Fa) Wichianchan	BOE/CWD	wirikit.wichianchan@lacity.org
Amy Lam	BOE/CWD	amy.lam@lacity.org

Items of Discussion:

1. **Ninyo & Moore presented their findings from Limited Phase II Site Assessment to LADWP and RAP**
    a. Ninyo & Moore encountered waste materials, generally consisted of construction debris (i.e., concrete, asphalt, brick) and other miscellaneous materials (i.e., plastic, glass, ceramic, and tires)
    b. The materials were encountered to depths of up to approximately 9 feet below the existing ground surface
2. **Next Steps & Recommendations:**
    a. BOE to send email to Local Enforcement Agency (LEA) notifying them about inert waste found at the project site and attach Limited Phase II ESA Report for Strathern Park
        i. If the Limited Phase II ESA Report is completed by this week (6/12/20), BOE will forward that to LEA
    b. Based on guidance from the LEA, the City will perform additional site investigations. CDM Smith and Ninyo & Moore will implement the additional site investigations by:
        i. Developing a workplan
        ii. Performing additional historical investigations
        iii. Developing test pits locations
            1. Test pits may be located within existing RAP baseball fields
        iv. Delineating the extent of waste
        v. Characterizing the waste
    c. The City, CDM Smith, and Ninyo & Moore will prepare a Post Closure Land Use Report for review by the LEA

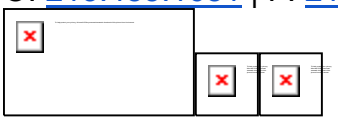
Subject: Stormwater Capture Parks - Undocumented Waste at Strathern Park

Hello Everyone,

Thank you for taking the time to attend our focus meeting on *Undocumented Waste at Strathern Park* for the Stormwater Capture Parks Program on 9/21/20. Please see below for the meeting minutes and action items from our meeting. Please let me know if you have any comments or questions.

Undocumented Waste at **Strathern Meeting Minutes**

September 21, 2020



1. Comments from LEA/RWQCB/CalRecycle on the Limited Phase II ESA report
    a. Could not find documentation of Strathern Park North as a landfill site.
    b. RWQCB mentioned that a post-closure land use plan is not necessary since the waste was left at the site in the 1950s (before the Hazardous and Solid Waste Amendment - November 8, 1984).
    c. Stormwater components shall not be constructed over waste material
        i. Stormwater components shall not create leachate.
        ii. Stormwater structures shall be constructed on proper subgrade. Remove waste material if necessary.
        iii. Infiltration galleries will be installed approximately 20 to 25 feet below surface so galleries will likely require removal of waste and will be installed below the lowest point of waste encountered.
1. Delineation of waste area
    a. LEA mentioned that the delineation of the waste can be limited to project limits. BOE does not have to explore the existing ballfield areas for waste.
1. Miscellaneous
    a. Strathern Park North is not in a methane or methane buffer zone. Ninyo & Moore mentioned they performed a small test for methane with their borings and did not detect any methane gas.
        i. See Section 10.7 Soil Gas Screening and Section 14.2 Duplicate and Field Screening of the draft Phase II ESA report.

Action Items:

1. LEA to check with RWQCB and CalRecycle regarding the following:
    a. If BOE is only required to delineate waste within project limits.
    b. Confirm with CalRecycle that a Post Closure Land Use Plan is not needed.
    c. If a Post Closure Land Use Plan is not required, what sort of oversight documentation and reviews are required if any?
1. LEA to send BOE a compiled list of comments from RWQCB and CalRecycle.

Thank you,
Fa

Subject: LEA Comments on Undocumented Waste at Strathern Park

Dear Mr. Wichianchan,

The City of Los Angeles Local Enforcement Agency (LEA) has received the Limited Phase II Environmental Site Assessment, dated June 30, 2020, for the proposed stormwater capture parks program at Strathern Park North. Since the LEA shares jurisdiction with the California Department of Resources Recycling and Recovery (CalRecycle) and the Los Angeles Regional Water Quality Control Board (LARWQCB), the report was forwarded to these agencies for review and comment.

The agencies have all searched our records and archives and were not able to find any information regarding a landfill at this location. It appears from the report that the waste was found from 3 to 13 feet in depth and consisted mostly of AC, concrete, brick, bottles, glass ceramic, plastic and tires in the borings and test pits. It is speculated that this material may have been placed at this location during the 1950s from nearby construction projects. No methane gas was detected during the study.

In order to avoid any major impacts to the site from the construction of the stormwater capture park, the agencies have the following conditions:

- The undocumented waste should be delineated and sample for COcs (chemicals of concern) related to waste materials within the project site.

- The project should be designed so as not to be constructed within the waste mass to prevent issues with leachate and/or landfill gas generation.

- Infiltration galleries that need to be constructed within the waste mass will be required to remove waste material and to properly disposed of it at a permitted facility.

- Submit a work plan that document the results of the waste delineation, details the specifics of the construction project and how it relates to the onsite waste, the procedures for dealing with any waste that is encountered and the environmental monitoring procedures that will be utilized during the construction. Part of the work plan should consists of a soils management plan, that addresses any SWPPP requirements and potential impacts to storm water, fugitive dust etc.

- After the completion of the project, an as-built report should be submitted.

If you have any questions, please do not hesitate to contact me.

Sincerely,

David Thompson
LEA Program Manager

Subject: Strathern Park North
LEA Approval of Work Plan for Phase II Assessment

Dear Ms. Abramson-Beck,

On April 8, 2021, the City of Los Angeles Local Enforcement Agency (LEA) received the ***Work Plan to Conduct Additional Phase II Environmental Site Assessment,*** dated April 7, 2021, for the Stormwater Capture Parks Program at a portion of Strathern Park North. The work plans objectives are to characterize and delineate the waste at the site, evaluate the current cover and conduct sampling and analytical testing to characterize the wastes. The LEA has shared the work plan with our partnering state agency, California Department of Resources Recycling and Recovery (CalRecycle) for their review and comment.

After discussion with CalRecycle, the LEA has the following comments regarding the site:

- The LEA approves of the Work Plan for the Additional Phase II Environmental Site Assessment. The operator can proceed with the work according to this plan. The LEA must be notified and grant approval of any substantial changes to this work plan prior to implementation.

- After completion of the Phase II ESA, a Waste Management Plan should be prepared to be used any time subsurface activities are conducted at Strathern Park North (a portion of which is the site) based on the park being the location of waste disposal. The WMP should include the entire park.

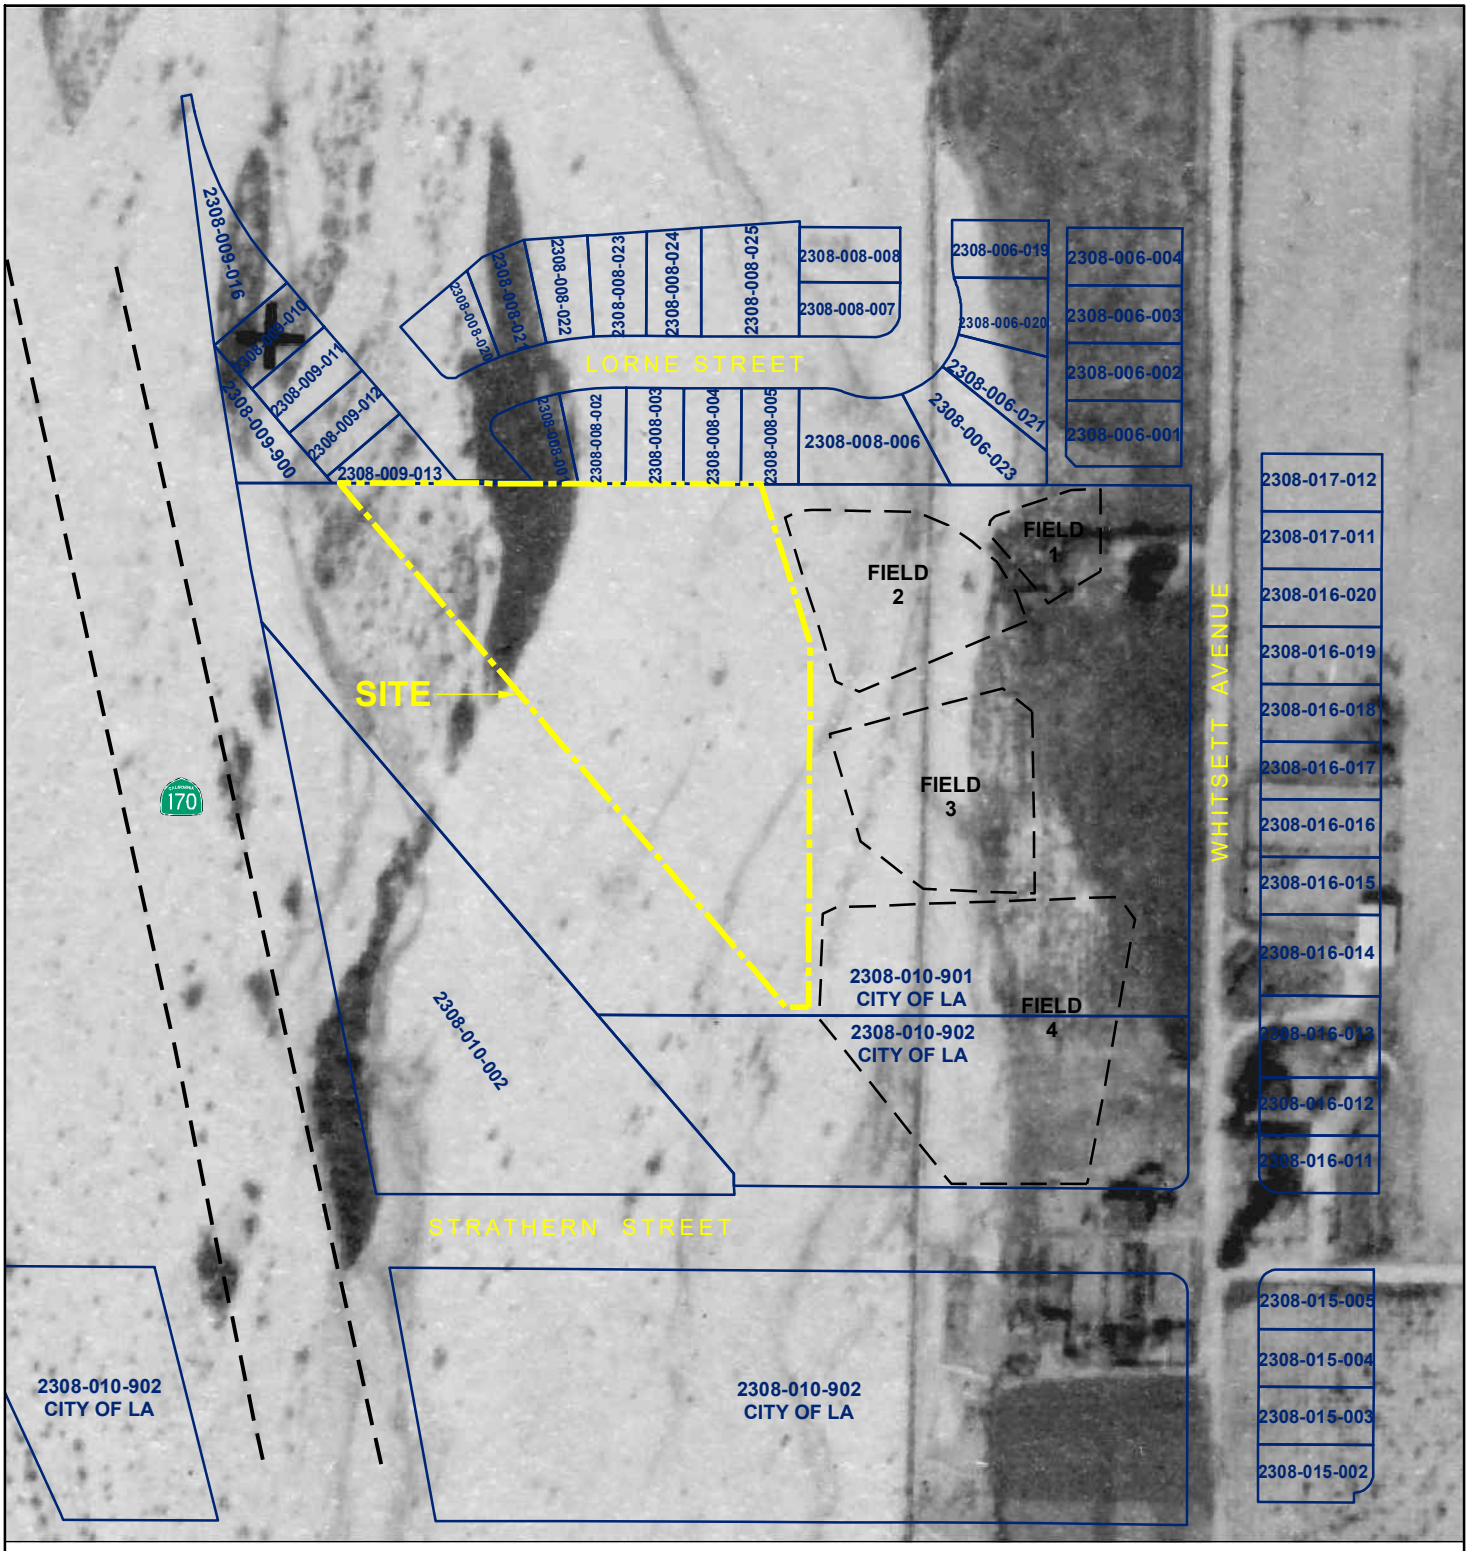
- Based on the original geotechnical investigation performed and information from boring and trench logs, the site is a disposal site and would be subject to solid waste state minimum standards.

- The site will need to be included on CalRecycle's Solid Waste Information System (SWIS) and obtain a site specific number. Please complete and return the attached form to the LEA with the necessary site owner and operator information. The LEA will work with CalRecycle on issuing the SWIS number.

- Pursuant to 27 CCR 21190, a post closure land use plan is required for this project. The plan should reflect the findings from this Phase II study. As part of this plan, a landfill gas monitoring plan should be included that demonstrates the protection of the adjacent residential property.

- It is recommended that clean-closure of the waste in the project site. If all of the waste cannot be removed, then the waste that remain in place will need to comply with state minimum standards and long-term maintenance and monitoring.

If you have any questions regarding this approval, please feel free to contact me at 213-252-3932.



Sincerely,

David Thompson
LEA Program Manager

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Atlas No. 121162SWG
Report No. 1

MS. BETH ABRAMSON-BECK, PG
NINYO & MOORE
5710 RUFFIN ROAD
SAN DIEGO, CA 92123

SUBJECT: Geophysical Evaluation
Strathern Park North
8041 Whitsett Avenue, North Hollywood, California

Dear Ms. Abramson-Beck:

In accordance with your authorization, Atlas Technical Consultants LLC (Atlas) has performed a geophysical evaluation pertaining to a portion of the Strathern Park North project located at 8041 Whitsett Avenue in North Hollywood, California. Specifically, our services included the performance of magnetic (MAG) and electromagnetic (EM) evaluations at preselected portions of the site. The purpose of the study was to delineate the limits of the preexisting landfill, as well as evaluate the presence of subsurface objects/debris within the study boundary limits. Our services were conducted on April 27th, 2021. This report presents the survey methodology, equipment used, analysis, and findings.

We appreciate the opportunity to be of service on this project. Should you have any questions related to this report, please contact the undersigned at your convenience.

Respectfully submitted,

Stephan A. Callas
Senior Staff Geophysicist

Patrick F. Lehrmann, P.G., P.Gp.
Principal Geologist/Geophysicist

1. INTRODUCTION

In accordance with your authorization, Atlas Technical Consultants LLC (Atlas) has performed a geophysical evaluation pertaining to a portion of the Strathern Park North project located at 8041 Whitsett Avenue in North Hollywood, California (Figure 1). Specifically, our services included the performance of magnetic (MAG) and electromagnetic (EM) evaluations at preselected portions of the site. The purpose of the study was to delineate the limits of the preexisting landfill, as well as evaluate the presence of subsurface objects/debris within the study boundary limits. Our services were conducted on April 27th, 2021. This report presents the survey methodology, equipment used, analysis, and findings.

2. SCOPE OF SERVICES

Our scope of services included:

- Performance of MAG and EM evaluations across accessible portions of the site using a Geometrics G858 cesium vapor magnetometer and Geonics EM31-MK2 terrain conductivity meter in conjunction with a Trimble Pro XRS global positioning system (GPS) for spatial control.
- Compilation and geophysical analysis of the collected data.
- Preparation of this report presenting our findings and conclusions.

3. SITE AND PROJECT DESCRIPTION

The study area is generally located just east of California State Route 170 (The Hollywood Freeway) on the northwest corner of the intersection between Strathern Street and Whitsett Avenue. Specifically, the project site is located at 8041 Whitsett Avenue in North Hollywood, California (Figure 1).

Based on our discussions with you and review of historical aerial images, it is our understanding that the limits of the preexisting landfill at the project site are unknown. It is also our understanding that your office is conducting an environmental assessment of the former landfill. Our study included the use of MAG and EM evaluations for an approximately 3-acre portion of the site. The study limits were selected by a representative of your office based on reported information regarding the preexisting landfill materials. Figure 2 presents the current site conditions.

4. GEOPHYSICAL INSTRUMENTATION AND APPLICATIONS

Our geophysical evaluation was accomplished through the collection of MAG and EM31 data. Specifically, to assess the areal extent of landfill materials and subsurface anomalies, the MAG and EM31 were used in conjunction to evaluate soil conductivity and the presence of subsurface metallic objects, potentially related to the lateral extent of landfill debris. The following sections detail the methods and instrumentation used.

4.1 MAG Evaluation

Magnetometer data was collected within the study boundary limits in order to assess the presence of ferromagnetic metals. The MAG data was acquired using a Geometrics G-858 cesium vapor magnetometer, which measures the strength of the earth's magnetic field and the superposed magnetic field of ferromagnetic materials in its vicinity. The precision of the instrument is approximately 1/10th gamma. The earth's magnetic field strength at the project site's latitude was roughly 46,566.7 gammas on April 27th, 2021 (https://www.ngdc.noaa.gov/geomag-web/#igrfwmm). The earth's magnetic field is inclined in the direction of the north magnetic pole. Because of this inclination, a buried ferromagnetic object is typically expressed as a paired anomaly with a positive (above background) slightly to the south and a negative slightly in the direction of magnetic north. Solar geomagnetic activity for the magnetometer survey was predominantly quiet, according to the National Oceanic and Atmospheric Administration (NOAA) (ftp://ftp.swpc.noaa.gov/ pub/warehouse). In addition, pre- and post-survey measurements were collected at a test station to assess diurnal variations. Variations of less than 20 gammas were observed. Due to these relatively small magnetic field variances, no diurnal corrections were made to the recorded magnetometer data.

The MAG data was collected in conjunction with a Trimble Pro XRS GPS along profile lines that were spaced approximately 5 to 10 feet apart, access permitting. The data was later downloaded to a laptop computer and then processed and analyzed using Magmap (Geometrics, 2017) and Surfer (Golden Software, Inc., 2002). The results are presented using both contour lines and a color gradient image in gammas. Typically, relatively significant features are revealed in the MAG data as red/pink and blue/purple. The orange and yellow areas likely represent smaller objects.

4.2 EM31 Evaluation

EM data was collected within the study boundary limits using a Geonics EM31-MK2 terrain conductivity meter in order to assess the presence of conductors and non-conductors in the subsurface. The EM31 is a frequency domain terrain conductivity meter that operates at a frequency of 9.8 kHz and has an effective exploration depth of approximately 20 feet. It is comprised of two coils: a transmitter coil and receiver coil. The transmitter coil induces circular eddy currents that generate a magnetic field in the subsurface, which is related to the terrain conductivity. There are two components of the magnetic field that are measured by the EM31: the quadrature-phase (QP) and the in-phase (IP) components. The QP provides an electrical conductivity measurement, in millimho per meter (mmho/m). The IP measurements represent the ratio of the induced secondary magnetic field to the primary magnetic field in parts per thousand (ppt). The IP measurement is significantly more sensitive to large metallic objects than the QP. Before the collection of EM31 datasets, calibration of the instrument was performed.

The EM data was collected in conjunction with a Trimble Pro XRS GPS along profile lines that were roughly spaced 5 to 10 feet apart, access permitting. The data was downloaded to a laptop computer and then processed and analyzed using DAT31W (Geonics, Inc., 2018) and Surfer (Golden Software, Inc., 2002). Both the QP and IP results are presented using contour lines and a color gradient image. Typically, relatively significant features are revealed as significant

variations from the background values. In the IP results, high values are shown as red/pink colors and low values are shown as blue/purple colors. Typically, in the QP results blue/purple represent low conductivity (high resistivity) values and red/pink represent high conductivity (low resistivity) values.

5. FINDINGS AND CONCLUSIONS

As previously discussed, the primary purpose of our study was to delineate the limits of the preexisting landfill as well as evaluate the presence of subsurface objects/debris within the study boundary limits. This was accomplished by assessing ferromagnetic, conductive, and resistive materials in the study areas through the collection of MAG and EM31 data. The results of the MAG evaluation are illustrated in Figure 3a. The results of the EM31 QP and IP evaluations are presented in Figures 3b and 3c, respectively.

The results of the MAG evaluation are illustrated in Figure 3a using both contour lines and a color gradient image in gammas. Relatively significant features are revealed in the MAG data as hot (red/purple) and cool (blue) colors. The results of the MAG data displayed several areas of high and low magnetic responses. These responses did not indicate a clear lateral landfill limit; however, the eastern portion of the site displays an anomalous area of concentrated high and low magnetic responses. This anomalous area may be related to landfilled material and/or zones of subsurface ferrous objects/materials; however, the exact cause and/or nature of this response in not known. Within this area, there appears to be an unidentified line that terminates towards the central portion of the site. Additionally, there appears to be an area of low magnetic response in the southern-most corner of the site. The cause and/or nature of this response is not known. It should be noted that the MAG data revealed several strong high and low magnetic responses boarding the site adjacent to the chain link fence; these are likely the result of surficial metallic objects such as chain link fencing, parking stops, baseball equipment and/or unidentified lines. However, these surficial features could mask subsurface debris and/or landfilled materials.

The results of the EM31 QP evaluation are illustrated in Figure 3b using both contour lines and a color gradient image in millimhos per meter (mmho/m). The cool colors (blue) represent lower conductivity values, whereas the warm colors (red/pink) represent higher conductivity values. The results of the QP data revealed a distinct regional change in values across the study area. Specifically, the northern portion of the site contained an area of lower conductivity materials, which appears to extend towards the central portion of the study area. The southern portion of the site has a more conductive response (Figure 3b). The exact cause and/or nature of these responses is not known; however, they could be related to changes in fill conductivity or moisture content. Additionally, there is a higher conductivity response along the perimeter of the study area. This response appears to be the effect of the chain link fencing and other surface metallic objects.

The results of the EM31 IP evaluation are illustrated in Figure 3c using both contour lines and a color gradient image in parts per thousand (ppt). The cool colors (blue) represent lower values, whereas the warm colors (red/pink) represent higher values. The results of the IP data revealed a very subtle change in the central and southern portion of the study area. The scattered low

amplitude responses in the central and south portions of the site appear to correlate well with the area of concentrated high and low magnetic responses in the MAG data (Figure 3a). The exact cause and/or nature of this response is not known; however, could be related to landfilled materials. Additionally, there appears to be a concentrated area of high and low responses in the southern-most corner of the site. This anomalous area correlates well with the results of the MAG and EM31 QP data (Figure 3a and 3c). The exact cause and/or nature of this response is not known.

In conclusion, the results of the MAG and EM31 IP evaluations appear to correlate well. They reveal an anomalous area of high and low magnetic responses in the eastern portion of the site and could be related to shallow buried metallic objects and/or landfilled materials. As previously discussed, the results of the EM31 QP data display a distinct regional change in conductivity. The northern portion of the site contains an area of lower conductivity values that extends towards and gradually becomes more conductive near the southern portion of the study area. The cause and/or nature of this response is not known; however, it could be related to changes in soil conductivity and/or moisture content. Additionally, there appears to be an anomalous area in the southern-most corner of the site that is present in the MAG, QP, and IP results. The cause and/or nature of these responses are not known.

Our study utilized industry standard equipment (i.e. magnetic electromagnetic instruments) and was conducted in general accordance with current practice. It should be noted that the presence of existing structures and surface objects (i.e. fences, reinforced concrete parking stoppers, etc.) may have potentially limited the study. Where obstructions were present, subsurface data could not be collected. Moreover, EM/magnetic responses produced by metal surface objects and underground lines can potentially obscure subsurface features. Figure 2 present the general site conditions and some of the obstructions encountered.

6. LIMITATIONS

The field evaluation and geophysical analyses presented in this report have been conducted in general accordance with current practice and the standard of care exercised by consultants performing similar tasks in the project area. No warranty, express or implied, is made regarding the conclusions and opinions presented in this report. There is no evaluation detailed enough to reveal every subsurface condition. Variations may exist and conditions not observed or described in this report may be present. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Atlas should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document. This report is intended exclusively for use by the client. Any use or reuse of the findings, conclusions, and/or recommendations of this report by parties other than the client is undertaken at said parties' sole risk.

TEST PIT LOG

STRATHERN PARK
NORTH HOLLYWOOD, CALIFORNIA

PROJECT NO.	DATE
211294007	7/21

DATE EXCAVATED 4/28/21 TEST PIT NO. TP15

GROUND ELEVATION ~810' ± (MSL) LOGGED BY BAB

METHOD OF EXCAVATION Trackhoe Excavator

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

① FILL:
Brown, dry to moist, clayey silty SAND.

② ALLUVIUM:
Gray, moist, loose, SAND; with gravels and cobbles.

NOTES

Total Depth = 7.5 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.

NOTES:
-Test pit is an extension of test pits TP-13 and TP-14.
-Waste not observed.

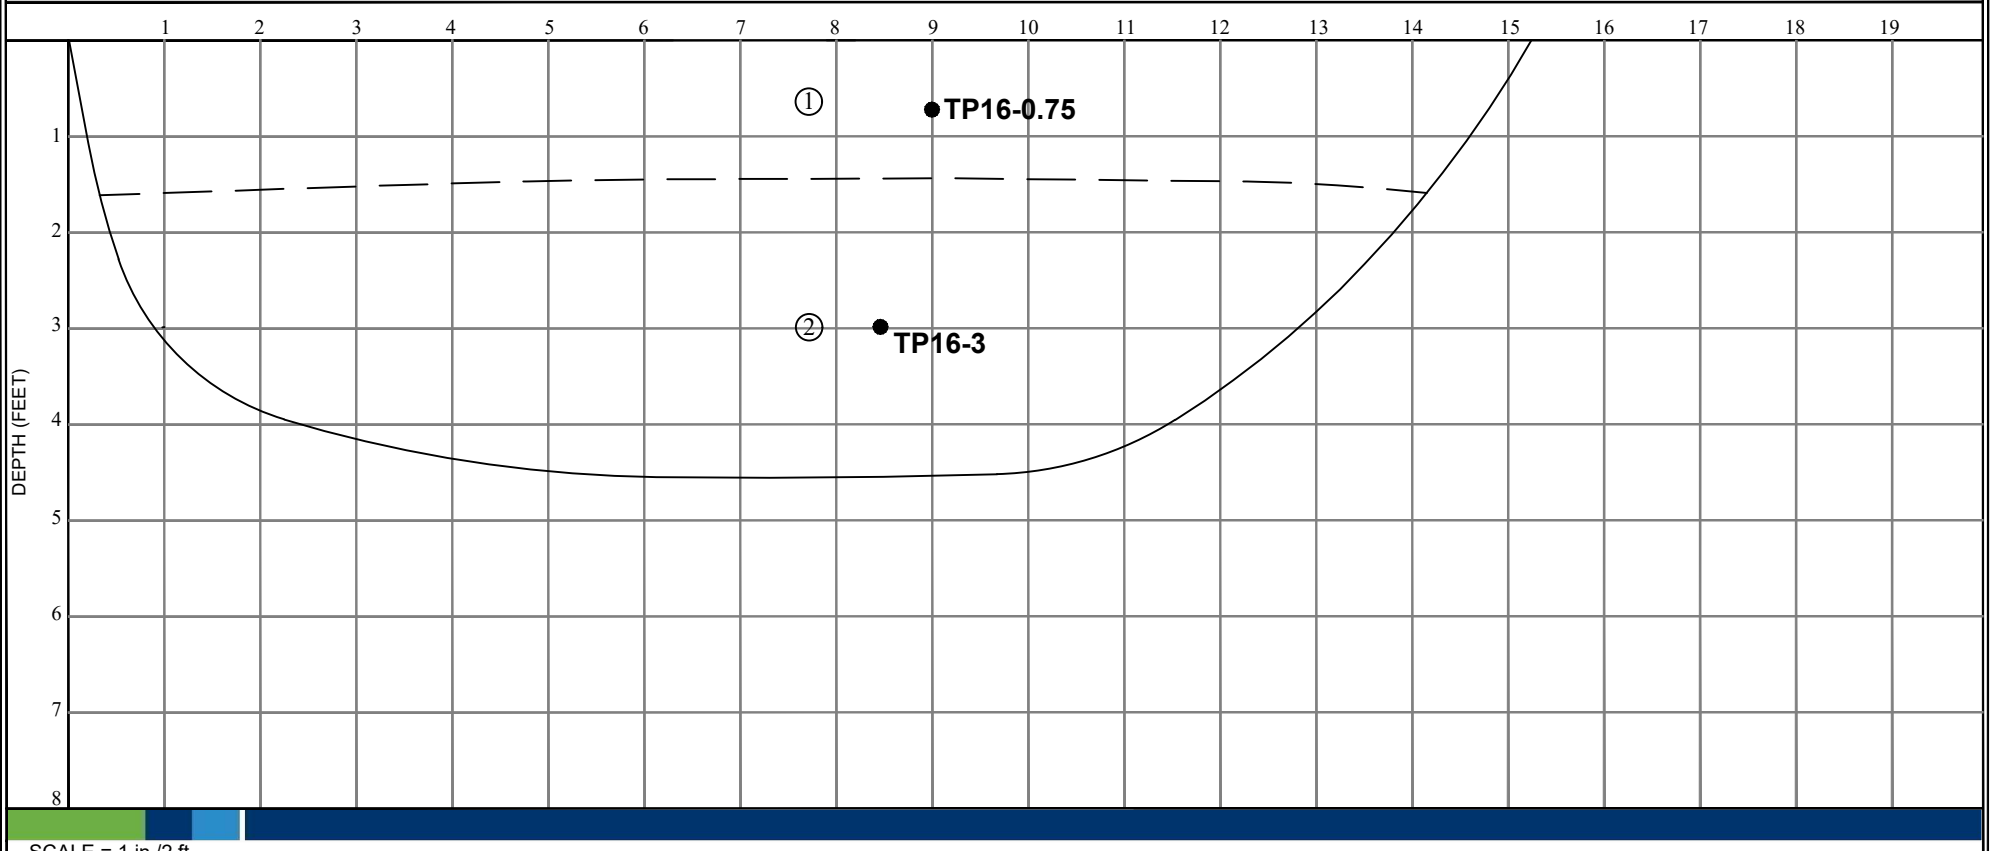
METHOD OF EXCAVATION Trackhoe Excavator

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

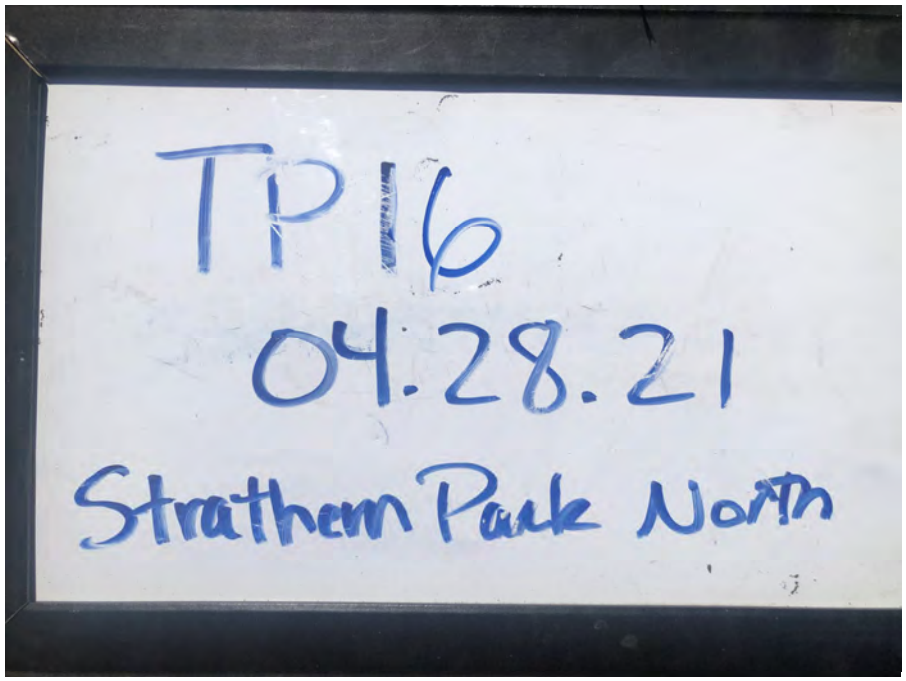
① FILL + MINOR WASTE:
Brown, dry to moist, clayey silty SAND; with some gravels and cobbles; with minor wastes, consisting of concrete and large metal/steel (?), beam.



② ALLUVIUM:
Gray, moist, loose, SAND; with gravels and cobbles.

NOTES

Total Depth = 4.5 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.



NOTES:
-Waste contact between test pits TP16 and TP11.
-Test pit is an extension of test pits TP-13, TP-14, and TP-15.

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

① FILL:
Brown, dry to moist, clayey silty SAND, one piece of brick.

② ALLUVIUM:
Gray, dry to moist, loose, SAND; with gravels.

NOTES

Total Depth = 7 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.

NOTES:
-Waste not observed except for one piece of brick.

DATE EXCAVATED 4/28/21 TEST PIT NO. TP18

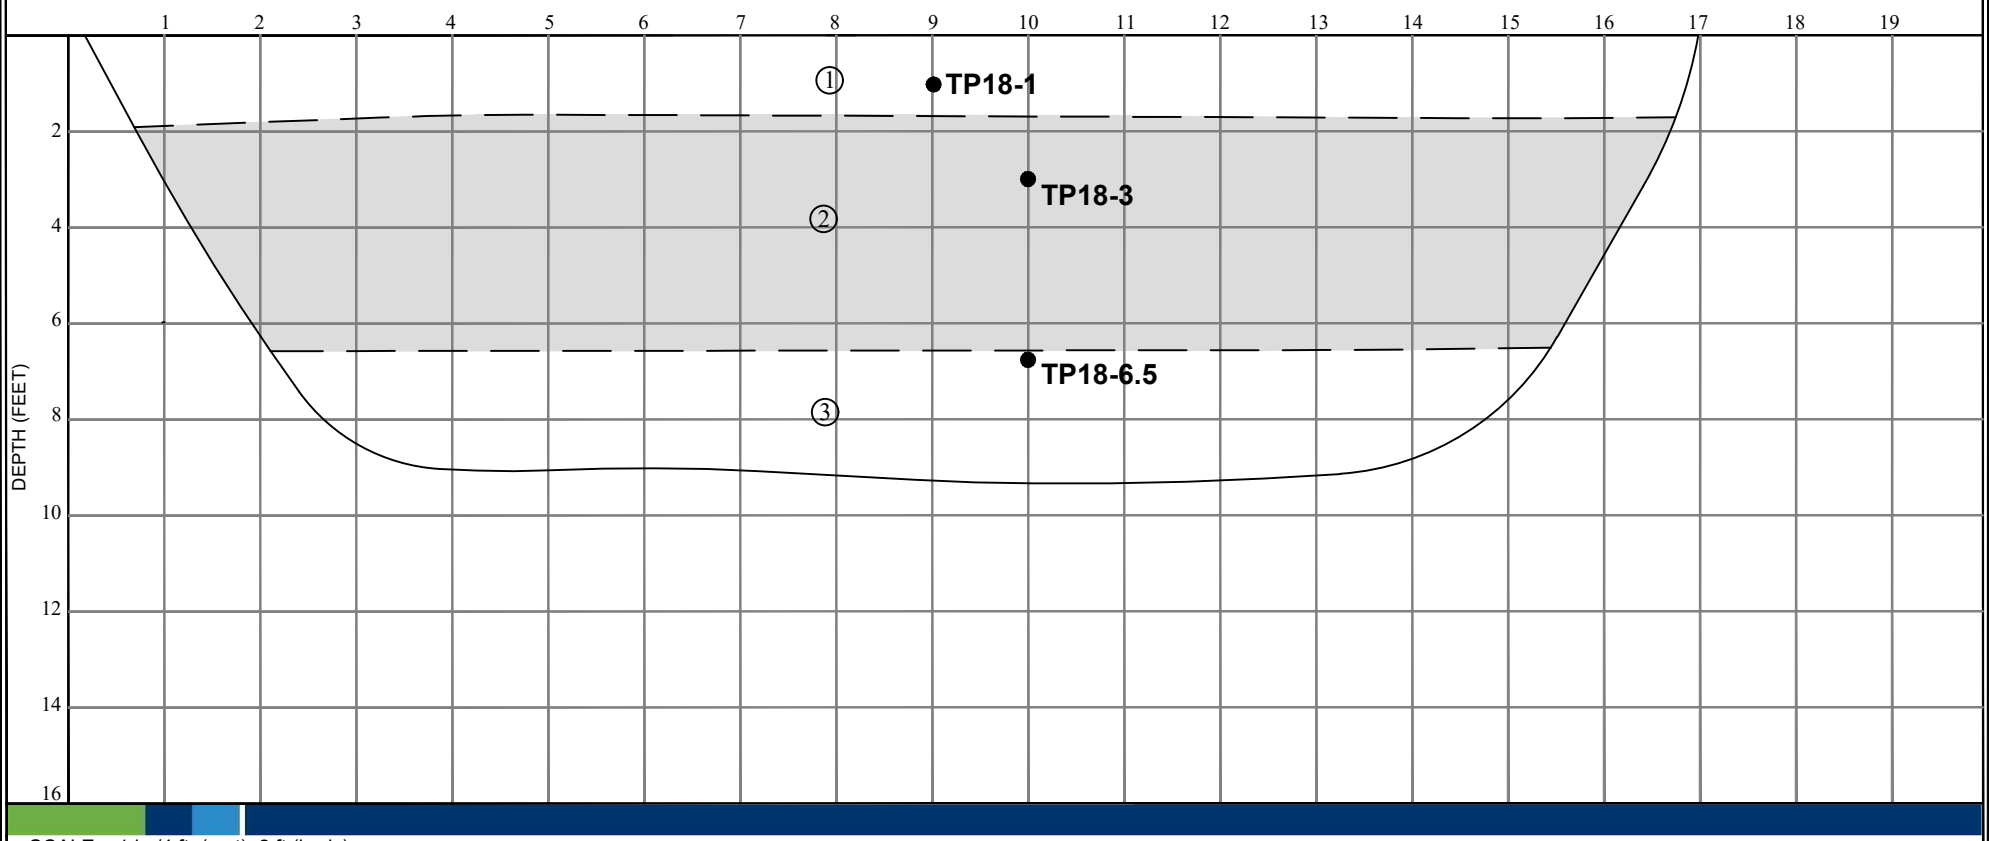
GROUND ELEVATION ~810' ± (MSL) LOGGED BY BAB

METHOD OF EXCAVATION Trackhoe Excavator

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

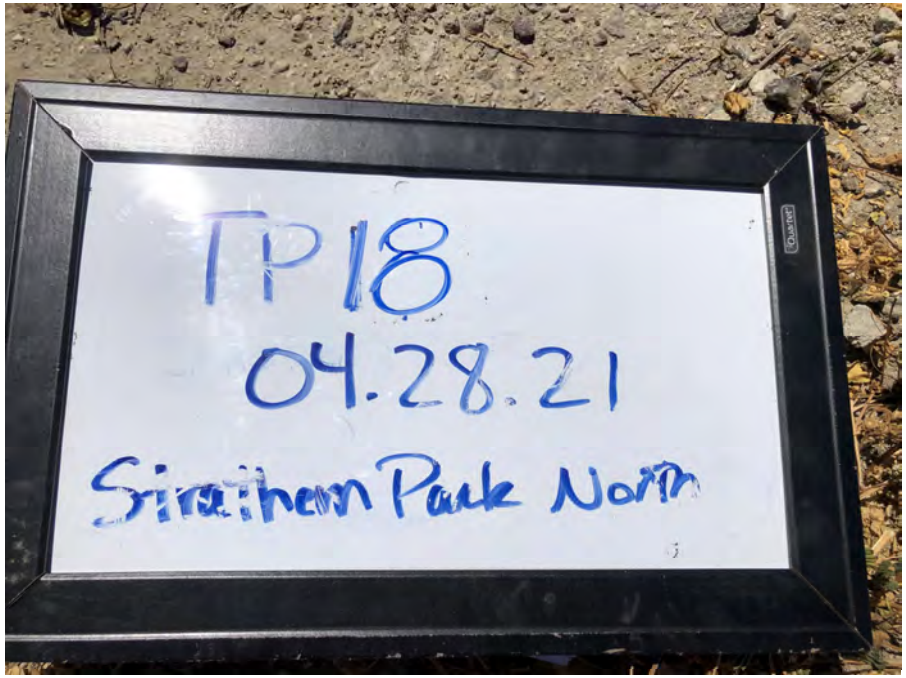
① FILL:
Light brown to brown, dry to moist, clayey silty SAND.



② FILL + WASTE:
Light brown to brown, moist, silty SAND; with wastes, estimated at approximately 35 to 40 percent, consisting primarily of concrete rubble and slabs, asphalt, cinder blocks, brick, metal wire, occasional glass bottle, occasional wood, tile, brillo pad, reinforced wire mesh.

③ ALLUVIUM:
Gray, moist, loose, SAND.

NOTES



Total Depth = 9 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

① FILL:
Brownish, moist, clayey silty SAND; with occasional concrete; plastic and asphalt.

② FILL + WASTE:
Brownish, moist, clayey silty SAND; with wastes, estimated at approximately 35 to 40 percent, consisting primarily of concrete rubble, some large pieces of cinder blocks, brick, asphalt, metal wire, metal pipe.

③ ALLUVIUM:
Gray, moist, loose, SAND; with gravels and cobbles.

NOTES

Total Depth = 6.5 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.

NOTES:
-Severe caving of excavation.

GROUND ELEVATION ~810' ± (MSL) LOGGED BY BAB

METHOD OF EXCAVATION Trackhoe Excavator

LOCATION See Figure 4

DESCRIPTION / INTERPRETATION

① BASE:
Approximately 0.5 feet thick.

② FILL:
Brown, moist, silty fine SAND; not definitive contact.

③ FILL + WASTE:
Dark brown, moist loose, clayey silty SAND; with wastes, estimated at approximately 25 percent, consisting primarily of asphalt, concrete, occasional metal wire, brick, occasional broken glass, metal rebar.

④ FILL + BURNED WASTE:
Mottled black brown to brown, moist, clayey silty SAND; with burned wastes, estimated at approximately 50 to 75 percent, consisting primarily of broken and melted glass, fused glass, metal debris.

⑤ ALLUVIUM:
Gray, moist, loose, SAND; with gravels and cobbles.

NOTES

Total Depth = 7 feet.
Groundwater not encountered during excavation.
Excavation backfilled on 04/28/21.

NOTES:
-Test pit located west of TP7 to delineate burned waste.
-Wastes at TP7 extend west to TP21.

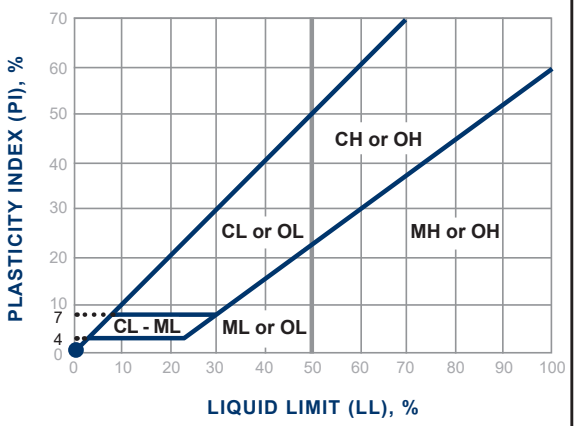
APPENDIX E

Previous Test Pit Logs, Boring Logs, and Cone Penetrometer Tests – March 2020



Soil Classification Chart Per ASTM D 2488

Primary Divisions			Secondary Divisions	
			Group Symbol	Group Name
COARSE-GRAINED SOILS more than 50% retained on No. 4 sieve	**GRAVEL** more than 50% of coarse fraction retained on No. 4 sieve	CLEAN GRAVEL less than 5% fines	GW	well-graded GRAVEL
			GP	poorly graded GRAVEL
		GRAVEL with DUAL CLASSIFICATIONS 5% to 12% fines	GW-GM	well-graded GRAVEL with silt
			GP-GM	poorly graded GRAVEL with silt
			GW-GC	well-graded GRAVEL with clay
			GP-GC	poorly graded GRAVEL with clay
		GRAVEL with FINES more than 12% fines	GM	silty GRAVEL
			GC	clayey GRAVEL
			GC-GM	silty, clayey GRAVEL
	SAND 50% or more of coarse fraction passes No. 4 sieve	CLEAN SAND less than 5% fines	SW	well-graded SAND
			SP	poorly graded SAND
		SAND with DUAL CLASSIFICATIONS 5% to 12% fines	SW-SM	well-graded SAND with silt
			SP-SM	poorly graded SAND with silt
			SW-SC	well-graded SAND with clay
			SP-SC	poorly graded SAND with clay
		SAND with FINES more than 12% fines	SM	silty SAND
			SC	clayey SAND
			SC-SM	silty, clayey SAND
FINE-GRAINED SOILS 50% or more passes No. 200 sieve	**SILT and CLAY** liquid limit less than 50%	INORGANIC	CL	lean CLAY
			ML	SILT
			CL-ML	silty CLAY
		ORGANIC	OL (PI > 4)	organic CLAY
			OL (PI < 4)	organic SILT
	SILT and CLAY liquid limit 50% or more	INORGANIC	CH	fat CLAY
			MH	elastic SILT
		ORGANIC	OH (plots on or above "A"-line)	organic CLAY
			OH (plots below "A"-line)	organic SILT
	Highly Organic Soils		PT	Peat

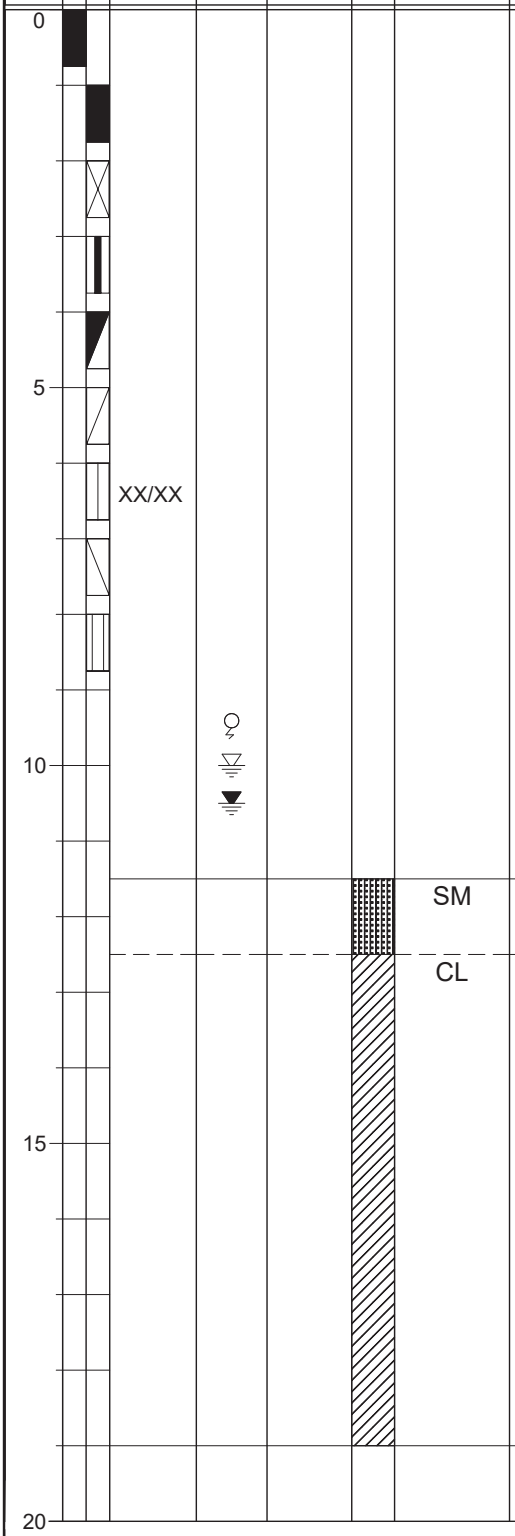
Grain Size

Description		Sieve Size	Grain Size	Approximate Size
Boulders		> 12"	> 12"	Larger than basketball-sized
Cobbles		3 - 12"	3 - 12"	Fist-sized to basketball-sized
Gravel	Coarse	3/4 - 3"	3/4 - 3"	Thumb-sized to fist-sized
	Fine	#4 - 3/4"	0.19 - 0.75"	Pea-sized to thumb-sized
Sand	Coarse	#10 - #4	0.079 - 0.19"	Rock-salt-sized to pea-sized
	Medium	#40 - #10	0.017 - 0.079"	Sugar-sized to rock-salt-sized
	Fine	#200 - #40	0.0029 - 0.017"	Flour-sized to sugar-sized
Fines		Passing #200	< 0.0029"	Flour-sized and smaller

Plasticity Chart

Apparent Density - Coarse-Grained Soil

Apparent Density	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)
Very Loose	≤ 4	≤ 8	≤ 3	≤ 5
Loose	5 - 10	9 - 21	4 - 7	6 - 14
Medium Dense	11 - 30	22 - 63	8 - 20	15 - 42
Dense	31 - 50	64 - 105	21 - 33	43 - 70
Very Dense	> 50	> 105	> 33	> 70



Consistency - Fine-Grained Soil

Consis-tency	Spooling Cable or Cathead		Automatic Trip Hammer	
	SPT (blows/foot)	Modified Split Barrel (blows/foot)	SPT (blows/foot)	Modified Split Barrel (blows/foot)

BORING LOG EXPLANATION SHEET

Bulk sample.

Modified split-barrel drive sampler.

No recovery with modified split-barrel drive sampler.

Sample retained by others.

Standard Penetration Test (SPT).

No recovery with a SPT.

Shelby tube sample. Distance pushed in inches/length of sample recovered in inches.

No recovery with Shelby tube sampler.

Continuous Push Sample.

Seepage.

Groundwater encountered during drilling.

Groundwater measured after drilling.

SM

MAJOR MATERIAL TYPE (SOIL):

Solid line denotes unit change.

CL

Dashed line denotes material change.

Attitudes: Strike/Dip
b: Bedding
c: Contact
j: Joint
f: Fracture
F: Fault
cs: Clay Seam
s: Shear
bss: Basal Slide Surface
sf: Shear Fracture
sz: Shear Zone
sbs: Shear Bedding Surface

The total depth line is a solid line that is drawn at the bottom of the boring.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: Ninyo & Moore Project: Strathern Park North

Date Received: 4/28/2021 Sampler's Name Present: ☑ Yes ☐ No

Section 2

Sample(s) received in a cooler? ☑ Yes, How many? 2 ☐ No (skip section 2) Sample Temp (°C) (No Cooler): _____

Sample Temp (°C), One from each cooler: #1: 5.5 #2: 5.0 #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: ☑ Ice ☐ Ice Packs ☐ Bubble Wrap ☐ Styrofoam ☐ Paper ☐ None ☐ Other _____

Cooler Temp (°C): #1: 1.3 #2: 1.2 #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✔		
Are sample IDs present?	✔		
Are sampling dates & times present?	✔		
Is a relinquished signature present?	✔		
Are the tests required clearly indicated on the COC?		✔	
Are custody seals present?		✔	
If custody seals are present, were they intact?			✔
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)	✔		✔ ER 4/28/21
Did all samples arrive intact? If no, indicate in Section 4 below.	✔		
Did all bottle labels agree with COC? (ID, dates and times)	✔		
Were the samples collected in the correct containers for the required tests?	✔		
Are the containers labeled with the correct preservatives?			✔
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✔
Was a sufficient amount of sample submitted for the requested tests?	✔		

Section 5 Explanations/Comments

Per client, will assign tests. No sampling time on COC for Sample 35 (TP11-3.5) per container time is 07:50.

Section 6

For discrepancies, how was the Project Manager notified? ☐ Verbal PM Initials: _____ Date/Time _____

☑ Email (email sent to/on): RKC / 4/28/2021

Project Manager's response:

Completed By: _____ Date: 4/28/2021

Flag Status: Flagged

Hi Ranjit,
Hope all is well.
Please conduct the following additional testing indicated as a blue x with pink highlight and blue circle.
Thank you so much!

Subject: Strathern Park North - Enthalpy Data (444657) (Invoice CINV-033567)

Hi Beth Abramson,

Project ID changed from "Strathem Park North" to "Strathern Park North". The office being invoiced has also been changed from Ninyo - San Diego to Ninyo - Irvine per Dan Chavez.

Please find attached the following files:
• Invoice
• PDF Deliverable
• Standard Format EDD (444657_standard.zip)

Email was also sent to: kgilbert@ninyoandmoore.com, nmaccountspayable@ninyoandmoore.com

1.0 PURPOSE

This Storm Water Pollution Prevention Plan (SWPPP) lists and describes Best Management Practices (BMPs) that will be used during this construction project to minimize the potential for pollutants to leave the site during construction activities. Construction BMPs can include structural devices, material storage methods, and operational procedures used to prevent, control, and treat storm water pollution emanating from the site. Construction activities can disturb large areas that result in erosion and transportation of related particulates such as sediments and dust to nearby waterways. In excess amounts, these particulates can increase water turbidity and consequently impair aquatic life and beneficial uses of the water.

Pollutants such as hydrocarbons, metals, nutrients, toxic substances, trash, and other debris can be generated from a variety of construction activities and can travel with eroded sediments. Potential pollutants traveling with the sediments may include the organic components in the top soil, plant residues, nutrient elements, organic material, deposited atmospheric pollutants, and other liquid and solid wastes.

The amended federal Clean Water Act of 1987 (CWA) added a requirement to address construction site storm water pollution. In California, construction activities consisting of one acre or more of soil are subject to the National Pollutant Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Runoff Associated with Construction Activity (General Permit). This permit requires all dischargers (i.e. landowners or developers) to prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) prior to disturbing a site. This (SWPPP) is designed to meet the requirements of the General Permit. This SWPPP must also be implemented at the appropriate level to protect water quality at all times throughout the entire construction project, including both dry and wet weather. BMPs must be implemented and maintained to control erosion, sediment, other construction pollutants, and non-storm water discharges year-round. Other requirements of this SWPPP include employee training, site inspections, and proper maintenance of BMPs as necessary. Los Angeles Department of Water and Power (LADWP) construction crews and personnel, as well as its contractors and subcontractors, are required to follow the guidelines and BMPs outlined in this SWPPP. They are also required to ensure proper implementation and maintenance of such BMPs for the entire duration of this project.

A copy of this SWPPP must be maintained at the construction site. This SWPPP must be modified as necessary to reflect any changes in personnel or construction site conditions.

Amendments to this SWPPP must be documented using the forms provided in Appendix G**.**

2.0 OBJECTIVES

A. The SWPPP shall be designed to address the following objectives:

1. All pollutants and their sources, including sources of sediment associated with construction, construction site erosion and all other activities associated with construction activity are controlled;

2. Where not otherwise required to be under a Regional Water Board permit, all non-storm water discharges are identified and either eliminated, controlled, or treated;

3. Site BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the BAT/BCT standard;

4. Calculations and design details as well as BMP controls for site run-on are complete and correct, and

5. Stabilization BMPs installed to reduce or eliminate pollutants after construction are completed.

B. To demonstrate compliance with requirements of this General Permit, the QSD shall include information in the SWPPP that supports the conclusions, selections, use, and maintenance of BMPs.

C. The discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone. -

2.1 TRAINING QUALIFICATIONS AND CERTIFICATION REQUIREMENTS

A. General

The discharger shall ensure that all persons responsible for implementing requirements of this General Permit shall be appropriately trained in accordance with this section 2.1.(See Section *5.5 (a) Employee Training Program* for more details). Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Those responsible for preparing and amending SWPPPs shall comply with the requirements in this section.

The discharger shall provide documentation of all training for persons responsible for implementing the requirements of this General Permit in the Annual Reports.

B. SWPPP Certification Requirements

1. Qualified SWPPP Developer: The discharger shall ensure that SWPPPs are written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

   a. A California registered professional civil engineer;

   b. A California registered professional geologist or engineering geologist;

   c. A California registered landscape architect;

   d. A professional hydrologist registered through the American Institute of Hydrology;

   e. A Certified Professional in Erosion and Sediment Control (CPESC) ™ registered through Enviro Cert International, Inc.;

   f. A Certified Professional in Storm Water Quality (CPSWQ) ™ registered through Enviro Cert International, Inc.; or

   g. A professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET);

   Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

2. The discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

3. Qualified SWPPP Practitioner: The discharger shall ensure that all BMPs required by this General Permit are implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   a. A certified erosion, sediment and storm water inspector registered through Enviro Cert International, Inc.; or

   b. A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc. Effective two years

after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

4. The LRP shall list in the SWPPP, the name of any Approved Signatory, and provide a copy of the written agreement or other mechanism that provides this authority from the LRP in the SWPPP.

5. The discharger shall include, in the SWPPP, a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

6. The discharger shall ensure that the SWPPP and each amendment will be signed by the Qualified SWPPP Developer. The discharger shall include a listing of the date of initial preparation and the date of each amendment in the SWPPP.

3.0 List of Contractors and Subcontractors

The tables below list the contractors and subcontractors conducting work at the site.
Table 1 Contractors and Subcontractors.

General Contractor: TBD

4.0 PROJECT INFORMATION

4.1 Project Description

As part of the Stormwater Capture Parks Program with Los Angeles Department of Public Works Bureau of Engineering (LABOE) and the Los Angeles Department of Water and Power (LADWP), the Strathern Park North Stormwater Capture Project includes the construction of a subsurface infiltration gallery, storm drain diversion structure and piping, and improved park facilities. The project will divert and infiltrate stormwater to replenish the San Fernando Groundwater Basin in order to increase local water supply; alleviate localized flooding; improve water quality; attenuate peak flow at downstream water bodies (i.e. Los Angeles River); and improve park amenities, and recreational and environmental education opportunities for the local community. The stormwater capture facilities are sized to ensure full capture of the entire 85th percentile, 24-hour storm event for the tributary areas upstream of the site. The total project site boundary area is approximately 300,000 square feet (sf), with 155,000 sf having land disturbing activities. Site improvements will add approximately 27,000 sf of impervious surface.

After the installation of proposed stormwater facilities are completed in the park, the excavated areas will be backfilled and graded to provide appropriate access to and drainage from the proposed field improvements. A geotechnical investigation and limited Phase 2 Environmental Site Assessment (ESA) were conducted to evaluate the subsurface conditions at the site. During these investigations, non-hazardous waste material was encountered in the proposed infiltration gallery area. These materials generally consisted of construction debris (i.e. concrete, asphalt, brick) and other miscellaneous materials such as plastic, glass, ceramic, and tires. The excavated soil containing waste material cannot be reused for grading and the waste material cannot be sorted out of the soil. Soil that does not contain waste, however, may be reused. It is unknown, at this time, the full extent of waste material in the soil. Based on the geotechnical investigations, waste was observed up to 13 feet deep and generally covered with approximately 0.5 to 2 feet of fill soil but will need to be verified during construction.

4.2 Project Risk Level Assessment

The California State Waterboard Risk Determination Worksheet was used to assess projects potential risk from the site sediment and the receiving waterbody. Both the site sediment and receiving water risk levels were determined to be low leading to a combined risk Level 1, see Appendix K.

Summary of Risk Factors

Sediment Risk (SR) Factor:

- R Factor Value: 56
- K Factor Value: 0.24
- LS Factor: 0.96

- Watershed Erosion Estimate: 12.9024 tons/acre
- Site Sediment Risk Factor: Low

Receiving Water (RW) Risk Factor:

- Project Receiving Water Risk: Low

Project Combined Risk: Level 1

4.2 Project Location

Strathern Park North is owned by the Los Angeles Department of Recreation and Parks (RAP). The park is bordered by Whitsett Avenue to the east, Strathern Street to the south, State Route 170 (Hollywood Freeway) to the west, and residential homes to the north in the Sun Valley neighborhood of the City of Los Angeles. The park is predominately surrounded by single and multi-family residential home. Opposite the park on Strathern Street is Jamie Beth Slaven Park.

To the west of the park, there is a 150-foot-wide easement for Los Angeles Department of Water and Power (LADWP) transmission line right of way that consists of four transmission towers with high-voltage overhead power lines, three caged water production wells and booster pumps, and a 60-inch underground water transmission main. Most of this easement area is paved.

4.3 Project Schedule

A condensed list of significant construction milestones can be found in the table below.

CONSTRUCTION PHASE	ESTIMATED COMPLETION DATE
Initial Construction Support Activities	08/11/2023
Infiltration Gallery	06/28/2024
Influent Facilities to Infiltration Gallery	06/21/2024
Site Work and Amenities	12/06/2024
Startup and Testing	12/31/2024

4.4 Existing Site Conditions

The entire property at Strathern Park is approximately 560,000 square feet (sf), or approximately 13 acres. Approximately 217,000 sf of the existing site is impervious surface. The site features four baseball fields, recreation center, and batting cages. There is an existing asphalt pavement parking lot for vehicular entry/egress off Whitsett Ave in the east side of the park. The park slopes from approximate elevations of 810 to 800 feet towards Strathern St and Whitsett Ave and to 805 feet towards Potter Ave. Runoff will drain southernly away from the park.

The perimeter of the park along Whitsett Ave and Strathern St. is observed to be raised several feet above the adjacent sidewalk elevation. The potential for stormwater to run on to the construction site from surrounding areas is unlikely.

The site consists of up to approximately 13 feet of undocumented fill, underlain by granular alluvial materials. The fill and alluvium are generally comprised of moist, very loose to very dense, poorly graded sand, poorly graded sand with silt, poorly graded sand with clay, well-graded sand with silt, silty sand, clayey sand, and sandy silt, as well as variable amounts of gravel and cobbles. The fill is potentially compressible. In general, excavations and drilling in the existing fill soil and alluvium should be feasible, but difficulties should be anticipated upon encountering waste and cobbles in the alluvium and undocumented fill. Groundwater was not encountered in the total depth explored of approximately 70.5 feet. Historical high groundwater levels range from approximately 110 and 120 feet below ground surface (bgs). Monitoring wells located approximately 800 feet southeast and 2,800 feet northwest of the site indicate that the depth to groundwater ranges from approximately 194 to 307 feet.

5.0 EFFLUENT LIMITS, POLLUTANT SOURCES, AND BMP IDENTIFICATION

5.1 Introduction

The General Permit requirements must be met on a year-round basis, not just during the wet season. Therefore, this SWPPP, and prescribed Best Management Practices must be implemented at the appropriate level and in a proactive manner during all seasons until the construction project is complete. Post-construction BMPs will be implemented after the project is complete as required by the General Permit (refer to Section 9.0 POST-CONSTRUCTION STANDARDS of this Plan).

BMPs are defined as "any program, technology, process, siting criteria, operational methods or measures, or engineered systems, that when implemented, prevent, control, remove or reduce pollution."

5.2 *Effluent Standards: Numeric and Narrative Limitations*

A. Numeric – There is no Numeric Effluent Limitation (NEL) for pH or Turbidity.

B. Narrative – Risk Level 2 dischargers shall comply with the Narrative Action Levels as follows:

1. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

2. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

3. The Numeric Action Level (NAL) for pH is 6.5 – 8.5. The test method is a field test with a calibrated portable instrument.

4. The NAL for turbidity is 250 NTU. The test method is EPA 180.1 and/or field test with a calibrated portable instrument.

5.3 Unauthorized Non-Storm Water Discharges

Elimination or reduction of "unauthorized non-storm water discharges" to the storm drain system or receiving waters is a major goal of the General Permit. Most non-storm water discharges are prohibited. Unauthorized non-storm water discharges can be generated from a variety of sources. Examples include, but are not limited to: waters from the rinsing or washing of vehicles, equipment, buildings and pavement; materials that have

been improperly disposed of or dumped and spilled, and leaked materials. Such discharges should be eliminated or reduced to the maximum extent practicable.

5.3 (a) Non-Storm Water Management

A. Dischargers shall implement measures to control all non-storm water discharges during construction.

B. Dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

C. Dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

5.4 Authorized Non-Storm Water Discharges

The General Permit authorizes certain non-storm water discharges that may be necessary for the completion of construction projects. Such discharges include, but are not limited to: irrigation of vegetative erosion control measures; fire hydrant flushing; potable water sources related to the operation and maintenance of potable water systems; drinking fountain water; atmospheric condensates including refrigeration, air conditioning, and compressor condensate; irrigation drainage; springs; ground water; and foundation or footing drainage. These discharges are allowed provided they are: 1) not relied upon to clean up failed or inadequate construction or post construction BMPs designed to keep materials on site; 2) infeasible to eliminate; 3) include BMPs described herein; and 4) do not cause or contribute to a violation of water quality standards. The General Permit prohibits the discharge of sediment-laden water offsite without prior treatment (detention or filtering).

5.5 Best Management Practices

The BMPs described in this document will be implemented to minimize the potential for pollutants to leave the project area and enter the storm drain system to the maximum extent practicable. The BMPs listed below are designed to minimize non-storm water discharges, minimize pollutants in storm water drainage and minimize the release of pollutants that can eventually be carried off by runoff, wind, or tracked out into the storm drain system. BMPs also include planning and preparing for rainfall. The site should be stabilized before a storm and BMPs should be checked for correct implementation prior to storm events. Appendix H lists sources for weather forecasts. Through proactive BMP implementation and good housekeeping measures, the construction site will pose a minimum threat of polluting local waterways through storm water runoff.

BMPs must be implemented to prevent or reduce the contact of non-storm water discharges with potential pollutant sources (i.e. waste storage areas, soil piles) and minimize to the extent practicable the flow or volume of non-storm water discharges.

Detailed descriptions of various types of BMPs for construction projects are located in Appendix M.

5.5 (a) Employee Training Program

All employees working on the site shall receive a general briefing about the importance of preventing storm water pollution, potential sources of storm water pollution, and the BMPs to be implemented at the site. New employees shall be briefed prior to work. Storm water pollution control training may be integrated with other training sessions, such as those conducted for worker safety, spill prevention, or hazardous materials management. Employees are encouraged to provide suggestions/feedback to improve training sessions and implementation of control practices.

Employees responsible for implementing, inspecting, maintaining, or repairing storm water pollution control practices should receive copies of relevant portions of this SWPPP and become familiar with their responsibilities. When such responsibilities shift from one employee to another, the outgoing employee shall pass on all necessary information to ensure the continuing effectiveness of the BMPs and SWPPP compliance, including copies of this SWPPP and inspection checklists. The table provided in Section 3.0 List of Contractors and Subcontractors, may be used to identify employees and their respective SWPPP responsibilities.

For projects that start during the dry season, refresher sessions on storm water pollution control must be conducted prior to the wet season. Additional training will be provided as necessary, based on site inspections and evidence of storm water quality problems.

Documentation of training will be maintained as part of this plan. Training documentation forms are located in Appendix F. Completed training records must be kept with this SWPPP.

5.5(b) Good Site Management "Housekeeping"

A. Documentation of BMPs in SWPPP
   Dischargers shall document all housekeeping BMPs in the SWPPP and in the REAP (See Section 6.0 Rain Event Action Plan (REAP)) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

B. Housekeeping
   Dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Dischargers shall implement the following good housekeeping measures:

1. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e., poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).
2. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).
3. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed)
4. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks. etc.).
5. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

C. Waste Management

Dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

1. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.
2. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.
3. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.
4. Cover waste disposal containers at the end of every business day and during a rain event.
5. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.
6. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.
7. Implement procedures that effectively address hazardous and non-hazardous spills.
8. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require:
   a. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly.
   b. Appropriate spill response personnel are assigned and trained.
   c. LADWP has spill notification phone numbers (Bulletin 2010-38), which must be included as a part of spill response training.

9. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

D. Vehicle Storage and Maintenance
Dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

Vehicles and equipment may pose a threat to storm water quality if their fluids come into contact with storm water runoff. When stored, place drip pans under vehicles or equipment. Vehicles and equipment will be inspected regularly to minimize leaks and drips. Equipment with chronic leakage problems will be returned to the yard for repair prior to continuing its use at the site. Refueling and vehicle maintenance at the construction site will be conducted only when absolutely necessary. When maintenance and repair of vehicles or equipment is required, every effort will be made to prevent any motor related fluids or wastes from leaving the designated repair area, which shall be located in designated areas away from storm drains and drainage areas. When vehicles or equipment are immobilized and need repair, drip pans and oil-absorbing mats should be placed beneath the vehicle in order to capture spilled fluids. Absorbent materials and other wastes (used oil filters, oily rags, etc.) must be disposed of properly with other hazardous wastes from the site (See Section 5.5 Best Management Practices). Vehicle washing will not be conducted onsite.

1. Prevent oil, grease, or fuel to leak into the ground, storm drains or surface waters.
2. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.
3. Clean leaks immediately and disposing of leaked materials properly.

E. Landscape Materials
Dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

1. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.
2. Contain all fertilizers and other landscape materials when they are not actively being used.
3. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.
4. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.
5. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

F. Potential Pollutant Sources

Dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 2 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.
b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.
c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.
d. Ensure retention of sampling, visual observation, and inspection records.
e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

G. Aerial Deposition

Dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

5.5 (c) Non-Storm Water Management

A. Dischargers shall implement measures to control all non-storm water discharges during construction. This includes groundwater, water used for dust control, water used for washing or rinsing, water leaks, chemical leaks, solid and liquid chemicals that are exposed to the elements.

B. Vehicle washing shall be done in a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

5.5 (d) Erosion Control

Construction activities that include grading and soil disturbance require a concentrated effort to prevent and minimize the transport of sediments into nearby storm drain inlets. Sediment can flow into nearby storm drain inlets through storm water runoff and non-storm water runoff. When the use of water is required, every effort should be made to

contain that water and allow it to evaporate in a bermed area. Remaining sediment and debris must be swept and removed from the street.

A. Dischargers shall implement effective wind erosion control (CASQA BMP WE-1).

B. Dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots. One or more of the following temporary soil stabilization measures may be applied to disturbed areas that will be inactive for extended periods. These measures may be used in conjunction with temporary linear sediment barriers.

- Hydraulic Mulch (CASQA BMP EC-3)
- Hydroseeding (CASQA BMP EC-4)
- Soil binders (CASQA BMP EC-5)
- Straw mulch (CASQA BMP EC-6)
- Geotextiles and mats (CASQA BMP EC-7)
- Wood mulching (CASQA BMP EC-8)

C. Dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

5.5 (e) Sediment Control

A. Dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

B. On sites where sediment basins are to be used, Dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook (CASQA BMP SE-2).

C. Dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

D. Dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 3.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and area not scheduled to be re-disturbed for at least 14 days

[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage.

[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 3. Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

One or more of the following sediment barriers will be used around disturbed areas that will be inactive for extended periods. These measures may be used in conjunction with temporary soil stabilization measures.

- Silt fence (CASQA BMP SE-1)
- Fiber rolls (CASQA BMP SE-5)
- Gravel bag berm (CASQA BMP SE-6)
- Sandbag barrier (CASQA BMP SE-8)
- Straw bale barrier (CASQA BMP SE-9)
- Drainage ditch

E. Dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

F. Dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire wash off locations) are maintained and protected from activities that reduce their effectiveness.

G. Dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity related materials that are deposited on the roads (by vacuuming or sweeping).

5.5 (f) Run-on and Run-off Controls

Dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off-site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

5.5 (g) Inspection, Maintenance and Repair

A. Dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

B. Dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

C. Upon identifying failures or other shortcomings, as directed by the QSP, Dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

D. For each inspection required, Dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

E. Dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

1. Inspection date and date the inspection report was written.
2. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.
3. Site information, including stage of construction, activities completed, and approximate area of the site exposed.
4. A description of any BMPs evaluated and any deficiencies noted.
5. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.
6. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.
7. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.
8. Photographs taken during the inspection, if any.
9. Inspector’s name, title, and signature.

5.5(h) Hazardous Waste Management and Disposal

Hazardous waste will be stored and handled in separate collection and containment areas in accordance with state and federal standards. Hazardous waste can be generated from equipment maintenance and refueling activities (e.g., anti-freeze, hydraulic fluids, gasoline, diesel fuel, waste oil). Other hazardous wastes include: pesticides, paints, cleaners, epoxies and sandblast grit. Hazardous waste will be stored in covered, labeled containers and secondary containment will be provided for liquid hazardous wastes. Different types of hazardous wastes will not be mixed so as to promote recycling and prevent undesirable chemical reactions.

5.5(i) Spill Prevention and Control

Leaks and spills from construction machinery generally contain petroleum products and heavy metals. Drip pans or some type of impermeable material will be placed under equipment that has been known to leak when such equipment is stored outdoors and not in use. Spills of any type will be cleaned up immediately. Drip pans will be cleaned as necessary to maintain their effectiveness. If absorbent is used for spills, it must be removed promptly and in a proper manner.

5.5(j) Materials Handling and Storage

The primary goal of BMPs for on-site storage of potential pollutants is to minimize the opportunity for them to come into contact with storm water. Hazardous materials, plasters, solvents, paints and other compounds must be properly handled and stored in order to reduce the risk of pollution or contamination. There will be a designated area for all hazardous materials storage, and for any filling or dispensing activity. This area must be located away from drainage paths and should not be directly on the ground (i.e. use plastic liners or containment pallets). This storage area will be covered, or at a minimum, the hazardous materials will be covered in some fashion, either by a tarp, within a covered construction tool bin, or within a storage container. The storage area should be surrounded by berms to prevent any materials from leaving the area should a spill or leak occur. Consideration should be paid to keeping only the minimum amount of hazardous materials on site. Follow manufacturer's instructions regarding storage and use of materials. If any product should come into contact with the soil, that soil will be removed immediately and properly disposed of as hazardous waste.

5.5 (k) Stockpile Management

Stockpile Management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, paving materials such as Portland cement, concrete rubble, asphalt concrete, aggregate base, asphalt minder and pressure treated wood.

1. Locate stockpiles a minimum of 50 ft away from concentrated flows of stormwater, draining courses, and inlets.

2. Protect all stockpiles from stormwater runoff using a temporary perimeter sediment barrier such as berms, dikes, fiber rolls, silt fences, sandbag, gravel bags, or straw bale barriers

3. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

4. Contain fertilizers and other landscape materials when they are not actively being used.

5. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

6. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

7. Stack erodible landscape material on pallets and cover such materials when not being used or applied.

5.5 (l) Scheduling

Work will not be conducted during storm events. Prior to finishing work before a storm event, the work area will be stabilized to reduce the potential for pollutants to leave the area and enter the storm drain system.

5.5 (m) Vehicle ingress and egress

Vehicles and equipment shall pass over metal shaker plates to loosen and remediate soil and debris from ingress/egress access points. Inspect ingress/egress access points daily and sweep tracked sediment as needed.

5.5(n) Concrete Truck Washing Waste

Concrete truck wash out will only be conducted over the open trench so that all concrete waste is captured and buried in the trench. When that is not feasible and the truck must be washed out in the work area, a containment area will be created to capture the wash water. When dry, concrete waste and residue will be swept and removed. Only as much concrete as needed will be mixed or brought on site in order to reduce the amount of concrete waste. If concrete truck rinsing must occur, it will be done in a contained area. Concrete rinse water must not enter the storm drain system. The concrete containment area must be cleaned out and maintained periodically to minimize the potential of storm water contamination.

6.0 RAIN EVENT ACTION PLAN (REAP)

Dischargers shall document all housekeeping BMPs in the SWPPP in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

A. The discharger shall ensure that a Qualified SWPPP Practitioner (QSP) develops a Rain Event Action Plan (REAP) 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The discharger shall

ensure a QSP obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

B. The discharger shall ensure that a QSP develops the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

C. The discharger shall ensure that the QSP ensures that the REAP include, at a minimum, the following site information:

1. Site Address
2. Calculated Risk Level 2
3. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
4. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
5. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

D. The discharger shall ensure a QSP includes in the REAP, at a minimum, the following project phase information:

1. Activities associated with each construction phase
2. Trades active on the construction site during each construction phase
3. Trade contractor information
4. Suggested actions for each project phase

E. The discharger shall ensure a QSP develops additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

1. Site Address
2. Calculated Risk Level 2
3. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
4. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
5. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number
6. Trades active on site during Inactive Construction
7. Trade contractor information
8. Suggested actions for inactive construction sites

F. The discharger shall ensure a QSP begins implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

G. The discharger shall ensure a QSP maintains onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

7.0 MONITORING AND REPORTING REQUIREMENTS

7.1 Introduction

This chapter addresses maintenance, inspection, and repair procedures for all construction-related BMPs to ensure that all graded surfaces, walls, berms, drainage structures, vegetation, erosion and sediment control measures, etc., are maintained in effective condition and are promptly repaired or restored. A properly trained person must be assigned the responsibility to conduct inspections. All completed inspection/ maintenance forms must be kept with this SWPPP. A written site- specific Construction Site Monitoring Program (CSMP) shall be developed and implemented prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required. Inspection forms are included in Appendix C.

The goals of the inspection program are:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions;

2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;

3. To determine whether immediate corrective actions, additional BMP or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges; and

4. To determine whether BMPs included in the SWPPP are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

The inspector should keep in mind that construction activity that cause or contribute to an exceedance of water quality standards must be corrected immediately. If storm water runoff is visibly oily or greasy, turbid, has a strong odor, or if it is known to contain pollutants such as pesticides, debris, sediment, settleable material or suspended material (i.e. trash), then it has potentially exceeded water quality standards.

If a violation of water quality standards is suspected, or if additional guidance or information is necessary, call the LADWP Wastewater Quality and Compliance Group (WQG) as soon as possible at (213) 367-0436.

7.2 Monitoring and Reporting Requirements

Table 4. Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
2	X	X	X	X	X	X	

7.2 (a) Construction Site Monitoring Program (CSMP) Requirements

A. Dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Table 4 - Summary of Monitoring Requirements, are completed.

B. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of this Storm Water Pollution Prevention Plan (SWPPP), included in **.**

C. As stated in Section *5.5(b) Good Site Management "Housekeeping"*, Risk Level 2 dischargers shall conduct an assessment and create a list of potential pollutant sources and a potential pollutant list. The list shall be kept with the SWPPP in the CSMP and shall identify all non-visible pollutants which are known, or should be known, to occur at the construction site.

D. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ.

E. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

7.2 (b) CSMP Monitoring Description

Dischargers shall include a description of the following items in the CSMP:

1. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

2. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples. **Note: the pH test must be performed immediately in the field. Turbidity test may be performed in the field or shipped to a lab provided the test is performed on the same day.**

3. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Table 5.

Table 5. Risk Level 2 Test Methods, Detection Limits, Reporting Units and Applicable NALs/NELs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2 Discharges other than ATS	1	NTU	250 NTU
		For ATS discharges	1	NTU	N/A
Any other pollutants identified for non-visible pollutant monitoring – see CSMP					

ATS = Active Treatment System

7.2 (c) Objectives

The CSMP shall be developed and implemented to address the following objectives:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs)/Numeric Effluent Limitations (NELs) of this General Permit.

2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

3. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

4. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

7.2 (d) Visual Observation and Sample Collection Exemptions

Dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

1. During dangerous weather conditions such as flooding and electrical storms.

2. Outside of scheduled site business hours.

If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 2 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7.3 Visual Monitoring (Inspection) Requirements for Qualifying Rain Events

Use form in

A. Dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

B. Dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

C. Dischargers shall conduct visual observations (inspections) during business hours only.

D. Dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

E. Within 2 business days (48 hours) prior to each qualifying rain event, Dischargers shall visually observe (inspect):

1. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.
2. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP and REAP. If needed, the discharger shall implement appropriate corrective actions.

3. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

F. For the visual observations (inspections) described in this Section, dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

G. Within two business days (48 hours) after each qualifying rain event, Dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

H. Dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

7.4 Water Quality Sampling and Analysis

Dischargers shall collect storm water grab samples from sampling locations, as defined in Section 7.4 (d) Effluent Sampling Locations. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

7.4 (a) Effluent Analysis Requirements

A. Dischargers shall analyze their effluent samples for:

1. pH and turbidity.

7.4 (b)Effluent Sampling Schedule

Dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

7.4 (c) Number of Effluent Samples

At minimum, Dischargers shall collect **3 samples per day** of the qualifying event (1/2 inch or more of rain causing the discharge).

7.4 (d) Effluent Sampling Locations

A. Dischargers shall collect storm water grab samples from sampling locations found in Table 6. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

B. Dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

C. Dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

Table 6. Sample Locations.[4]

Location ID:		
Location Description		
Coordinates	Lat:	Long:

Location Description		
Coordinates	Lat:	Long:
Location ID:		
Location Description		
Coordinates	Lat:	Long:

D. Dischargers shall ensure that storm water discharge collected and observed represents[5] the effluent in each drainage area based on visual observation of the water and upstream conditions.

E. Dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs or NELs.

F. Dischargers who deploy an Active Treatment System (ATS) on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

7.4 (e) Storm Water Sample Collection and Handling Instructions

A. Dischargers shall refer to Table 5 above for test methods, detection limits, and reporting units.

B. Dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

[4] To be determined.

[5] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment-laden water even if most water flowing through the fence is clear.

C. Dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP)[6].

7.4 (f)– Monitoring Methods

A. Dischargers shall include a description of the following items in the CSMP:

1. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

2. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples.

3. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Table 5 above.

B. Dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services. Dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

7.4 (g) Analytical Methods

A. Dischargers shall select analytical test methods from the list provided in Table 5 above for test methods, detection limits, and reporting units.

---

[6] Additional information regarding SWAMP's QAPrP and QAMP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/.
QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.
QAMP:http://www.waterboards.ca.gov/water_issues/programs/swamp/qamp.shtml.

B. pH: Dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 2 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section 7.6 – Records below.

C. Turbidity: Dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

7.4 (h) Non-Storm Water Discharge Monitoring Requirements

Visual Monitoring Requirements:

A. Dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

B. Dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

C. Dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 2 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

Effluent Sampling Locations:

A. Dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

B. Dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

C. Dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

7.4 (i) Non-Visible Pollutant Monitoring Requirements

A. Dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

B. Dischargers shall ensure that water samples are large enough to characterize the site conditions.

C Dischargers shall collect samples at all discharge locations that can be safely accessed.

D. Dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

E. Dischargers shall analyze samples for all non-visible pollutant parameters listed in the CSMP (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 2 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

F. Dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

G. Dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[6]

[6] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices

H. Dischargers shall keep all field /or analytical data in the SWPPP document.

7.4 (j)– Watershed Monitoring Option

Dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in *7.4 (d) Effluent Sampling Locations* (Section I.5 of Attachment D of the Permit). The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

7.5 Particle Size Analysis for Project Risk Justification

Dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

7.6 – Records

Dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Dischargers shall retain all records on-site while construction is ongoing. These records include:

1. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

2. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

3. The date and approximate time of analyses.

4. The individual(s) who performed the analyses.

5. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

6 Rain gauge readings from site inspections;

7. Quality assurance/quality control records and results.

8. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections 7.4 (h) Non-

Storm Water Discharge Monitoring Requirements and 7.4 (i) Non-Visible Pollutant Monitoring Requirements above).

9. Visual observation and sample collection exception records (see Section 7.2 (d) above).

10. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

7.7 NAL Exceedance Report

A. In the event that any effluent sample exceeds an applicable NAL, Dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

B. Dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

C. Dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

D. Dischargers shall include in the NAL Exceedance Report:

1. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

2. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

3. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

8.0 GENERAL REQUIREMENTS

8.1 SWPPP Certification

This SWPPP must be certified in accordance with the signatory requirements described below. Use the Compliance Certification Form provided at the end of this section, and make additional copies as needed.

8.2 Annual Site Compliance Evaluation and Certification

This SWPPP must be certified annually to ensure that construction activities comply with the requirements of the General Construction Permit. The certification should be based upon the results of required site inspections. This certification must be completed by July 1 of each year until the construction project is completed and a Notice of Termination (NOT) has been submitted to the State Water Resources Control Board.

8.3 SWPPP Amendments

This SWPPP will be amended whenever:

A. There is a change in construction or operations which may affect the discharge of pollutants to surface waters, ground waters, or the municipal storm drain system (e.g. Additional soils will be stored onsite, or excavation outside of the project area will be necessary);

B. There is a violation of any condition of the General Permit; or

C. The SWPPP has not achieved the general objective of reducing or eliminating pollutants in storm water discharges.

Use Appendix G to document all changes made to the SWPPP. Make additional copies of Appendix G as needed. Each amendment should be signed by the site construction manager or site supervisor and include the date of initial preparation and the date of each amendment. All amendments should be directly attached to this SWPPP.

8.4 SWPPP Availability

This SWPPP must be kept on the site while the site is under construction, beginning with the initial mobilization and ending with the termination of coverage under the permit. It should be available to site employees at all times and provided upon request to the Los Angeles Regional Water Quality Control Board or local storm water agency.

9.0 POST-CONSTRUCTION STANDARDS

A. All dischargers shall comply with the following runoff reduction requirements unless they are located within an area subject to post construction standards of an active Phase I or II municipal separate storm sewer system (MS4) permit that has an approved Storm Water Management Plan.

   1. This provision shall take effect three years from the adoption date of this permit, or later at the discretion of the Executive Officer of the Regional Board.

   2. The discharger shall demonstrate compliance with the requirements of this section by submitting with their NOI a map and worksheets in accordance with the instructions in Appendix 2 of Order No. 2009-0009-DWQ.The discharger shall use non-structural controls unless the discharger demonstrates that non-structural controls are infeasible or that structural controls will produce greater reduction in water quality impacts.

   3. The discharger shall, through the use of non-structural and structural measures as described in Appendix 2, of Order No. 2009-0009-DWQ replicate the pre-project water balance (for this permit, defined as the volume of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event (or the smallest storm event that generates runoff, whichever is larger). Dischargers shall inform Regional Water Board staff at least 30 days prior to the use of any structural control measure used to comply with this requirement. Volume that cannot be addressed using nonstructural practices shall be captured in structural practices and approved by the Regional Water Board. When seeking Regional Board approval for the use of structural practices, dischargers shall document the infeasibility of using non-structural practices on the project site, or document that there will be fewer water quality impacts

   4. For sites whose disturbed area exceeds two acres, the discharger shall preserve the pre-construction drainage density (miles of stream length per square mile of drainage area) for all drainage areas within the area serving a first order stream[14] or larger stream and ensure that post project time of runoff concentration is equal or greater than pre-project time of concentration.

B. All dischargers shall implement BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed at the site (Post-construction BMPs).

.

10.0 CERTIFICATION STATEMENT

This SWPPP must be evaluated and re-certified using this form annually by July 1 until the construction project is complete and a Notice of Termination has been submitted to the Regional Board. Use this form for the initial certification, annual re-certification, and re-certification following revisions. Additional blank forms can be made by copying the form included in Appendix J.

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment for knowing violations."

YES	NO	
		Are the BMPs called for in the SWPPP installed in the proper location according to the specifications for the SWPPP?
		Are all operational storm drain inlets protected from sediment inflow?
		Do any structural BMPs require repair or clean out to maintain adequate function? If yes, indicate which ones:
		Is there evidence of equipment leakage/ spillage of equipment/vehicle maintenance fluids?
		Are construction on-site traffic routes, parking, and storage of equipment and supplies restricted to areas specifically designated for those uses?
		Do any seeded or landscaped areas require maintenance, irrigation, and fertilization, seeding or mulching?
		Is there any evidence that sediment is leaving the site?

BMP and Drainage Area Inspection Form for Haskell Switching Station observed on _____, continued

Yes	No	
		Is there any evidence of floating and suspended material, sheen, discoloration, turbidity, or odor?
		Is there any evidence of sediment, debris, or mud on public roads at intersections with site access roads?
		Is there any evidence of incorrect waste disposal (paints, concrete, solid wastes)?
		Is the overall housekeeping sufficiently maintained?
		Is the vehicle/ equipment maintenance and cleaning areas clean and free of oil, grease or potential pollutants?
		Is the construction area access point stabilized? Has potential for mud/ dirt tracking from the site been minimized?
		Are liquid transfer areas (equipment fueling) clean and protected from rain?
		Are there any visible non-storm water discharges? Is there evidence that non-storm water discharges occurred in the past? If so, describe the non-storm water discharge:
		Are trashcans covered?
		Are sanitary waste facilities in working order and not leaking?

Describe Corrective Actions Taken or Recommended:
Describe any necessary revisions to the SWPPP or REAP

Fill out as many forms as necessary to cover all observation locations in the entire project area.

Construction Site Monitoring Plan

Construction Site Monitoring Program

1. Purpose

This Construction Site Monitoring Program was developed to address the following objectives:

1. To demonstrate that the site is in compliance with the Discharge Prohibitions and Numeric Action Levels (NALs) of the Construction General Permit;
2. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;
3. To determine whether immediate corrective actions, additional Best Management Practices (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in stormwater discharges and authorized non-stormwater discharges;
4. To determine whether BMPs included in the SWPPP and REAP are effective in preventing or reducing pollutants in stormwater discharges and authorized non-stormwater discharges.

2. Applicability of Permit Requirements

This project has been determined to be a Risk Level 2 project. The General Permit identifies the following types of monitoring as being applicable for a Risk Level 2 project.

Risk Level 2

- Visual inspections of BMPs;
- Visual monitoring of the site related to qualifying storm events;
- Visual monitoring of the site for non-stormwater discharges;
- Sampling and analysis of construction site runoff for pH and turbidity;
- Sampling and analysis of construction site runoff for non-visible pollutants when applicable; and
- Sampling and analysis of non-stormwater discharges when applicable.

3. Weather and Rain Event Tracking

Visual monitoring and inspections requirements of the General Permit are triggered by a qualifying rain event. The General Permit defines a qualifying rain event as any event that produces ½ inch of precipitation. A minimum of 48 hours of dry weather will be used to distinguish between separate qualifying storm events.

Visual monitoring, inspections, and sampling requirements of the General Permit are triggered by a qualifying rain event. The General Permit defines a qualifying rain event as any event that produces ½ inch of precipitation. A minimum of 48 hours of dry weather will be used to distinguish between separate qualifying storm events.

For the purposes of assessing exceptions to the Receiving Water Monitoring Triggers the General Permit establishes the compliance storm event at the 5-year, 24-hour event. Based on the Western Regional Climate Center, the 5-year, 24-hour event for this project is 4.5 inches.

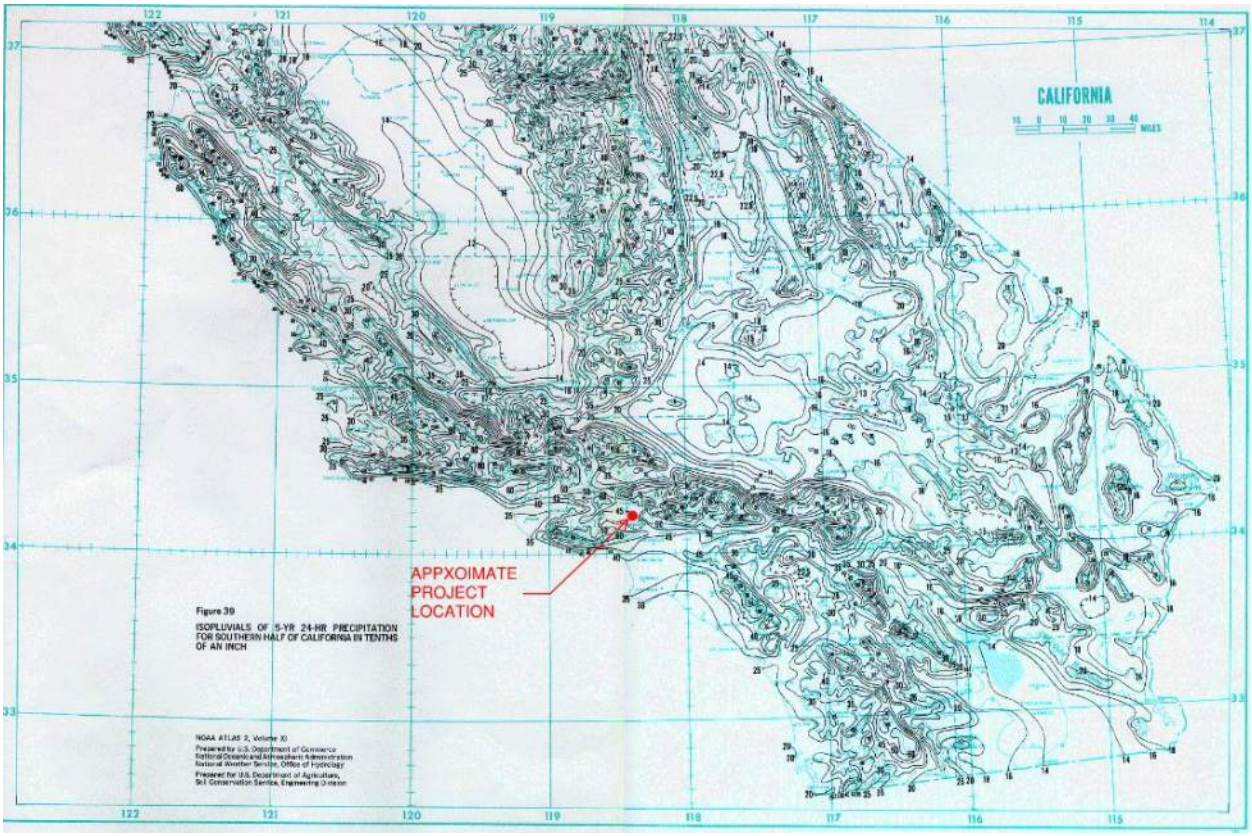

Figure 3.1 Western US Precipitation Frequency Map, Southern California

3.1. Weather Tracking

The QSP should daily consult the National Oceanographic and Atmospheric Administration (NOAA) for the Forecast Weather Table Interface. These forecasts can be obtained at http://forecast.weather.gov . Weather reports should be printed and maintained with the SWPPP in Appendix H "Weather Reports".

3.2. Rain Gauges

The QSP shall install 1 rain gauge on the project site. Locate the gauge in an open area away from obstructions such as trees or overhangs. Mount the gauge on a post at a height of 3 to 5 feet with the gauge extending several inches beyond the post. Make sure that the top of the gauge is level. Make sure the post is not in an area where rainwater can indirectly splash from sheds, equipment, trailers, etc.

The rain gauge(s) shall be read daily during normal site scheduled hours. The rain gauge should be read at approximately the same time every day and the date and time of each reading recorded. Log rain gauge readings in Appendix H "Weather Records". Follow the rain gauge instructions to obtain accurate measurements.

Once the rain gauge reading has been recorded, accumulated rain shall be emptied, and the gauge reset. Alternatively, include instructions for an automated recording rain gauge if used.

For comparison with the site rain gauge, the nearest appropriate governmental rain gauge(s) is located at Tujunga Spreading Grounds (https://dpw.lacounty.gov/wrd/rainfall/).

4. Monitoring Locations

Monitoring locations are shown on the Site Maps in Appendix B. Monitoring locations are described in the Sections 6 and 7.

Whenever changes in the construction site might affect the appropriateness of sampling locations, the sampling locations shall be revised accordingly. All such revisions shall be implemented as soon as feasible and the SWPPP amended. Temporary changes that result in a one-time additional sampling location do not require a SWPPP amendment.

5. Safety and Monitoring Exemptions

Safety practices for sample collection will be in accordance with the [ENTER TITLE AND PUBLICATION DATE OF CONTRACTOR'S HEALTH AND SAFETY PLAN FOR THE PROJECT OR PROVIDE SPECIFIC REQUIREMENTS IN THIS SECTION]. A summary of the safety requirements that apply to sampling personnel is provided below.

-
-
-
-

This project is not required to collect samples or conduct visual observations (inspections) under the following conditions:

- During dangerous weather conditions such as flooding and electrical storms.
- Outside of scheduled site business hours.

Scheduled site business hours are: [SPECIFY SITE BUSINESS DAYS AND HOURS].

If monitoring (visual monitoring or sample collection) of the site is unsafe because of the dangerous conditions noted above, then the QSP shall document the conditions for why an exception to performing the monitoring was necessary. The exemption documentation shall be filed in Appendix N "Monitoring Records".

6. Visual Monitoring

Visual monitoring includes observations and inspections. Inspections of BMPs are required to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Visual observations of the site are required to observe storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources.

Table 6.1 identifies the required frequency of visual observations and inspections. Inspections and observations will be conducted at the locations identified in Section 6.3.

Table 6.1 Summary of Visual Monitoring and Inspections

Type of Inspection	Frequency
Routine Inspections	
BMP Inspections	Weekly[1]
BMP Inspections – Tracking Control	Daily
[add rows for other BMPs as needed]	[Enter Frequency]

Table 6.1 Summary of Visual Monitoring and Inspections

Type of Inspection	Frequency
Non-Stormwater Discharge Observations	Quarterly during daylight hours
Rain Event Triggered Inspections	
Site Inspections Prior to a Qualifying Event	Within 48 hours of a qualifying event [2]
BMP Inspections During an Extended Storm Event	Every 24-hour period of a rain event[3]
Site Inspections Following a Qualifying Event	Within 48 hours of a qualifying event[2]

[1] Most BMPs must be inspected weekly; those identified below must be inspected more frequently.

[2] Inspections are required during scheduled site operating hours.

[3] Inspections are required during scheduled site operating hours regardless of the amount of precipitation on any given day.

6.1. Routine Observations and Inspections

Routine site inspections and visual monitoring are necessary to ensure that the project is in compliance with the requirements of the Construction General Permit.

6.1.1. Routine BMP Inspections

Inspections of BMPs are conducted to identify and record:

- BMPs that are properly installed;
- BMPs that need maintenance to operate effectively;
- BMPs that have failed; or
- BMPs that could fail to operate as intended.

6.1.2. Non-Stormwater Discharge Observations

Each drainage area will be inspected for the presence of or indications of prior unauthorized and authorized non-stormwater discharges. Inspections will record:

- Presence or evidence of any non-stormwater discharge (authorized or unauthorized);
- Pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.); and
- Source of discharge.

6.2. Rain-Event Triggered Observations and Inspections

Visual observations of the site and inspections of BMPs are required prior to a qualifying rain event; following a qualifying rain event, and every 24-hour period during a qualifying rain event. Pre-rain inspections will be conducted after consulting NOAA and determining that a precipitation event with a 50 percent or greater probability of precipitation has been predicted on the Forecast Weather Table Interface.

6.2.1. Visual Observations Prior to a Forecasted Qualifying Rain Event

Within 48 hours prior to a qualifying event, a stormwater visual monitoring site inspection will include observations of the following locations:

- Stormwater drainage areas to identify any spills, leaks, or uncontrolled pollutant sources;
- BMPs to identify if they have been properly implemented;
- Any stormwater storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

BMP inspections and visual monitoring will be triggered by a NOAA prediction of rain in the project area.

6.2.2. BMP Inspections During an Extended Storm Event

During an extended rain event BMP inspection will be conducted to identify and record:

- BMPs that are properly installed;
- BMPs that need maintenance to operate effectively;
- BMPs that have failed; or
- BMPs that could fail to operate as intended.

If the construction site is not accessible during the rain event, the visual inspections shall be performed at all relevant outfalls, discharge points, downstream locations. The inspections should record any projected maintenance activities.

6.2.3. Visual Observations Following a Qualifying Rain Event

Within 48 hours following a qualifying rain event (0.5 inches of rain), a stormwater visual monitoring site inspection is required to observe:

- Stormwater drainage areas to identify any spills, leaks, or uncontrolled pollutant sources;
- BMPs to identify if they have been properly designed, implemented, and effective;
- Need for additional BMPs;
- Any stormwater storage and containment areas to detect leaks and ensure maintenance of adequate freeboard; and
- Discharge of stored or contained rain water.

6.3. Visual Monitoring Procedures

Visual monitoring shall be conducted by the QSP or staff trained by and under the supervision of the QSP.

The name(s) and contact number(s) of the site visual monitoring personnel are listed below and their training qualifications are provided in Appendix F.

Assigned inspector: NAME OF INSPECTOR Contact phone: TELEPHONE NUMBER

Alternate inspector: NAME OF INSPECTOR Contact phone: TELEPHONE NUMBER

Stormwater observations shall be documented on the *Visual Inspection Field Log Sheet* (see Appendix O "Example Forms"). BMP inspections shall be documented on the site-specific BMP inspection checklist. Any photographs used to document observations will be referenced on stormwater site inspection report and maintained with the Monitoring Records in Appendix N.

The QSP shall within [Enter Number] days of the inspection submit copies of the completed inspection report to [Name].

The completed reports will be kept in Appendix N "Monitoring Records".

6.4. Visual Monitoring Follow-Up and Reporting

Correction of deficiencies identified by the observations or inspections, including required repairs or maintenance of BMPs, shall be initiated and completed as soon as possible.

If identified deficiencies require design changes, including additional BMPs, the implementation of changes will be initiated within 72 hours of identification and be completed as soon as possible. When design changes to BMPs are required, the SWPPP shall be amended to reflect the changes.

Deficiencies identified in site inspection reports and correction of deficiencies will be tracked on the *Inspection Field Log Sheet* or *BMP Inspection Report* and shall be submitted to the QSP and shall be kept in Appendix N "Monitoring Records".

The QSP shall within [Enter Number] days of the inspection submit copies of the completed *Inspection Field Log Sheet* or *BMP Inspection Report* with the corrective actions to [Name].

Results of visual monitoring must be summarized and reported in the Annual Report.

6.5. Visual Monitoring Locations

The inspections and observations identified in Sections 6.1 and 6.2 will be conducted at the locations identified in this section.

BMP locations are shown on the Site Maps in SWPPP Appendix B.

There are 3 drainage area(s) on the project site and the contractor's yard, staging areas, and storage areas. Drainage area(s) are shown on the Site Maps in Appendix B and Table 6.2 identifies each drainage area by location.

Table 6.2 Site Drainage Areas

Location No.	Location
1	Fernangeles Park
2	Fernangeles Park Southeast Swale
3	Allegheny Street
4	Morehart Avenue

There are [Enter Number] stormwater storage or containment area(s) are on the project site. Stormwater storage or containment area(s) are shown on the Site Maps in Appendix B and Table 6.3 identifies each stormwater storage or containment area by location.

Table 6.3 Stormwater Storage and Containment Areas

Location No.	Location

There are [Enter Number] discharge location(s) on the project site. Site stormwater discharge location(s) are shown on the Site Maps in Appendix B and Table 6.4 identifies each stormwater discharge location.

Table 6.4 Site Stormwater Discharge Locations

7. Water Quality Sampling and Analysis

7.1. Sampling and Analysis Plan for Non-Visible Pollutants in Stormwater Runoff Discharges

This Sampling and Analysis Plan for Non-Visible Pollutants describes the sampling and analysis strategy and schedule for monitoring non-visible pollutants in stormwater runoff discharges from the project site.

Sampling for non-visible pollutants will be conducted when (1) a breach, leakage, malfunction, or spill is observed; and (2) the leak or spill has not been cleaned up prior to the rain event; and (3) there is the potential for discharge of non-visible pollutants to surface waters or drainage system.

The following construction materials, wastes, or activities, as identified in Section 2.6, are potential sources of non-visible pollutants to stormwater discharges from the project. Storage, use, and operational locations are shown on the Site Maps in Appendix B.

- [LIST or State NONE]
- [LIST or State NONE]

The following existing site features, as identified in Section 2.6, are potential sources of non-visible pollutants to stormwater discharges from the project. Locations of existing site features contaminated with non-visible pollutants are shown on the Site Maps in Appendix B.

- NONE

The following soil amendments have the potential to change the chemical properties, engineering properties, or erosion resistance of the soil and will be used on the project site. Locations of soil amendment application are shown on the Site Maps in Appendix B.

- NONE

The project has the potential to receive stormwater run-on from the following locations with the potential to contribute non-visible pollutants to stormwater discharges from the project. Locations of such run-on to the project site are shown on the Site Maps in Appendix B.

- Caltrans Stormwater Pump Station

7.1.1. Sampling Schedule

Samples for the potential non-visible pollutant(s) and a sufficiently large unaffected background sample shall be collected during the first two hours of discharge from rain events that result in a sufficient discharge for sample collection. Samples shall be collected during the site's scheduled hours and shall be collected regardless of the time of year and phase of the construction.

Collection of discharge samples for non-visible pollutant monitoring will be triggered when any of the following conditions are observed during site inspections conducted prior to or during a rain event.

- Materials or wastes containing potential non-visible pollutants are not stored under watertight conditions. Watertight conditions are defined as (1) storage in a watertight container, (2) storage under a watertight roof or within a building, or (3) protected by temporary cover and containment that prevents stormwater contact and runoff from the storage area.
- Materials or wastes containing potential non-visible pollutants are stored under watertight conditions, but (1) a breach, malfunction, leakage, or spill is observed, (2) the leak or spill is not cleaned up prior to the rain event, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- A construction activity, including but not limited to those in Section 2.6, with the potential to contribute non-visible pollutants (1) was occurring during or within 24 hours prior to the rain event, (2) BMPs were observed to be breached, malfunctioning, or improperly implemented, and (3) there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- Soil amendments that have the potential to change the chemical properties, engineering properties, or erosion resistance of the soil have been applied, and there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.
- Stormwater runoff from an area contaminated by historical usage of the site has been observed to combine with stormwater runoff from the site, and there is the potential for discharge of non-visible pollutants to surface waters or a storm drain system.

7.1.2. Sampling Locations

Sampling locations are based on proximity to planned non-visible pollutant storage, occurrence or use, accessibility for sampling, and personnel safety. Planned non-visible pollutant sampling locations are shown on the Site Maps in Appendix B and include the locations identified in Tables 7.5 through 7.9.

Three sampling location(s) on the project site and the contractor's yard have been identified for the collection of samples of runoff from planned material and waste storage areas and areas where non-visible pollutant producing construction activities are planned.

Table 7.5 Non-Visible Pollutant Sample Locations – Project Site

Sample Location Number	Sample Location Description	Sample Location Latitude and Longitude
2	NE corner of Alleghney Street and Remick Avenue	N 1906096.97 E 6439663.04
3	Swale outlet on Wicks Avenue	N 1905806.95 E 6440353.45
4	NW corner of Wicks Avenue and Remick Ave	N 1905578.50 E 6440107.14

[Enter number of locations] sampling locations have been identified for the collection of samples of runoff from drainage areas where soil amendments will be applied that have the potential to affect water quality.

Table 7.6 Non-Visible Pollutant Sample Locations – Soil Amendment Areas

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

[Enter number of locations] sampling locations have been identified for the collection of samples of runoff from drainage areas contaminated by historical usage of the site.

Table 7.7 Non-Visible Pollutant Sample Locations – Areas of Historical Contamination

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

One sampling location(s) has been identified for the collection of an uncontaminated sample of runoff as a background sample for comparison with the samples being analyzed for non-visible pollutants. This location(s) was selected such that the sample will not have come in contact with the operations, activities, or areas identified in Section 7.1 or with disturbed soils areas.

Table 7.8 Non-Visible Pollutant Sample Locations – Background (Unaffected Sample)

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

One sampling location has been identified for the collection of samples of run-on to the project site. Run-on from these locations has the potential to combine with discharges from the site being sampled for non-visible pollutants. These samples are intended to identify potential sources of non-visible pollutants that originate off the project site.

Table 7.9 Non-Visible Pollutant Sample Locations – Site Run-On

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
1	SE corner of Alleghany Street and Laurel Canyon Boulevard	N 1906449.70 E 6440066.63

If a stormwater visual monitoring site inspection conducted prior to or during a storm event identifies the presence of a material storage, waste storage, operations area with spills, or the potential for the discharge of non-visible pollutants to surface waters or a storm drain system that is at a location not listed above and has not been identified on the Site Maps, sampling locations will be selected by the QSP using the same rationale as that used to identify planned locations. Non-visible pollutant sampling locations shall be identified by the QSP on the pre-rain event inspection form and/or Rain Event Action Plan prior to a forecasted qualifying rain event.

7.1.3. Monitoring Preparation

Non-visible pollutant samples will be collected by:

Contractor ☐ Yes ☐ No

Consultant ☐ Yes ☐ No

Laboratory ☐ Yes ☐ No

Samples on the project site will be collected by the following contractor sampling personnel:

Name/Telephone Number:

Alternate(s)/Telephone Number:

An adequate stock of monitoring supplies and equipment for monitoring non-visible pollutants will be available on the project site prior to a sampling event. Monitoring supplies and equipment will be stored in a cool temperature environment that will not come into contact with rain or direct sunlight. Sampling personnel will be available to collect samples in accordance with the sampling schedule. Supplies maintained at the project site will include, but are not limited to, clean powder-free nitrile gloves, sample collection equipment, coolers, appropriate

number and volume of sample bottles, identification labels, re-sealable storage bags, paper towels, personal rain gear, ice, and *Effluent Sampling Field Log Sheets* and Chain of Custody (CoC) forms, which are provided in Appendix O "Example Forms".

Samples on the project site will be collected by the following [specify laboratory or environmental consultant]:

Company Name:	TBD
Street Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	
Name of Sampler(s):	
Name of Alternate(s):	

The QSP or his/her designee will contact [specify name of laboratory or environmental consultant] 24 hours prior to a predicted rain event or for an unpredicted event, as soon as a rain event begins if one of the triggering conditions is identified during an inspection to ensure that adequate sample collection personnel and supplies for monitoring non-visible pollutants are available and will be mobilized to collect samples on the project site in accordance with the sampling schedule.

7.1.4. Analytical Constituents

Table 7.10 lists the specific sources and types of potential non-visible pollutants on the project site and the water quality indicator constituent(s) for that pollutant.

Table 7.10 Potential Non-Visible Pollutants and Water Quality Indicator Constituents

Pollutant Source	Pollutant	Water Quality Indicator Constituent
Asphalt Work	VOC	VOC
Concrete Work	pH	pH
Landscape Work	Pesticides/Herbicides	Product dependent, see label and check with laboratory

7.1.5. Sample Collection

Samples of discharge shall be collected at the designated non-visible pollutant sampling locations shown on the Site Maps in Appendix B or in the locations determined by observed breaches, malfunctions, leakages, spills, operational areas, soil amendment application areas, and historical site usage areas that triggered the sampling event.

Grab samples shall be collected and preserved in accordance with the methods identified in the Table 7.11, "Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants" provided in Section 7.1.6. Only the QSP, or personnel trained in water quality sampling under the direction of the QSP shall collect samples.

Sample collection and handling requirements are described in Section 7.7.

7.1.6. Sample Analysis

Samples shall be analyzed using the analytical methods identified in the Table 7.11.

Samples will be analyzed by:

Laboratory Name:	TBD
Street Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	
ELAP Certification Number:	

Samples will be delivered to the laboratory by:

Driven by Contractor	☐ Yes	☐ No
Picked up by Laboratory Courier	☐ Yes	☐ No
Shipped	☐ Yes	☐ No

7.1.7. Data Evaluation and Reporting

The QSP shall complete an evaluation of the water quality sample analytical results.

Runoff/downgradient results shall be compared with the associated upgradient/unaffected results and any associated run-on results. Should the runoff/downgradient sample show an increased level of the tested analyte relative to the unaffected background sample, which cannot be explained by run-on results, the BMPs, site conditions, and surrounding influences shall be assessed to determine the probable cause for the increase.

As determined by the site and data evaluation, appropriate BMPs shall be repaired or modified to mitigate discharges of non-visible pollutant concentrations. Any revisions to the BMPs shall be recorded as an amendment to the SWPPP.

Table 7.11 Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants

Constituent	Analytical Method	Minimum Sample Volume	Sample Containers	Sample Preservation	Reporting Limit	Maximum Holding Time
Notes:						

The General Permit prohibits the storm water discharges that contain hazardous substances equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4. The results of any non-stormwater discharge results that indicate the presence of a hazardous substance in excess of established reportable quantities shall be immediately reported to the Regional Water Board and other agencies as required by 40 C.F.R. §§ 117.3 and 302.4.

Results of non-visible pollutant monitoring shall be reported in the Annual Report.

7.2. Sampling and Analysis Plan for pH and Turbidity in Stormwater Runoff Discharges

Sampling and analysis of runoff for pH and turbidity is required for this project. This Sampling and Analysis Plan describes the strategy for monitoring turbidity and pH levels of stormwater runoff discharges from the project site and run-on that may contribute to an exceedance of a Numeric Action Level (NAL) or the exceedance of a Receiving Water Monitoring Trigger.

Samples for pH and turbidity will be collected at all discharge points where stormwater is discharged off-site.

7.2.1. Sampling Schedule

Stormwater runoff samples shall be collected for pH and turbidity from each day of a qualifying rain event that results in a discharge from the project site. A minimum of three samples will be collected per day of discharge during a qualifying event. Samples should be representative of the total discharge from the project each day of discharge during the qualifying event. Typically, representative samples will be spaced in time throughout the daily discharge event.

Stored or collected water from a qualifying storm event when discharged shall be tested for turbidity and pH. Stored or collected water from a qualifying event may be sampled at the point it is released from the storage or containment area or at the site discharge location.

Run-on samples shall be collected whenever the QSP identifies that run-on has the potential to contribute to an exceedance of a NAL or the exceedance of a Receiving Water Monitoring Trigger.

7.2.2. Sampling Locations

Sampling locations are based on the site runoff discharge locations and locations where run-on enters the site, accessibility for sampling, and personnel safety. Planned pH and turbidity sampling locations are shown on the Site Maps in Appendix B and include the locations identified in Table 7.13 and Table 7-14.

[Enter Number] sampling location(s) on the project site and the contractor's yard have been identified for the collection of runoff samples. Table 7.12 also provides an estimate of the site's area that drains to each location.

Table 7.12 Turbidity and pH Runoff Sample Locations

Sample Location Number	Sample Location	Estimate of Site [Factor] (%)
3	Swale outlet on Wicks Avenue	25
4	NW corner of Wicks Avenue and Remick Ave	75

[Enter number of locations] sampling locations have been identified for the collection of run-on samples where the run-on has the potential to contribute to an exceedance of an NAL or a Receiving Water Monitoring Trigger. Table 7.13 identifies the run-on sample locations.

Table 7.13 Turbidity and pH Run-On Sample Locations

Sample Location Number	Sample Location	Sample Location Latitude and Longitude (Decimal Degrees)
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]
[Enter Number]	[Enter Location]	[Enter Latitude] [Enter Longitude]

The project does not receive run-on with the potential to exceed NALs or Receiving Water Monitoring Triggers.

7.2.3. Monitoring Preparation

Turbidity and pH samples will be collected and analyzed by:

Contractor ☐ Yes ☐ No

Consultant ☐ Yes ☐ No

Laboratory ☐ Yes ☐ No

Samples on the project site will be collected by the following contractor sampling personnel:

Name/Telephone Number:

Alternate(s)/Telephone Number:

An adequate stock of monitoring supplies and equipment for monitoring turbidity and will be available on the project site prior to a sampling event. Monitoring supplies and equipment will be stored in a cool temperature environment that will not come into contact with rain or direct sunlight. Sampling personnel will be available to collect samples in accordance with the sampling schedule. Supplies maintained at the project site will include, but are not limited to, field meters, extra batteries, clean powder-free nitrile gloves, sample collection equipment, appropriate sample containers, paper towels, personal rain gear, and *Effluent Sampling Field Log Sheets* and CoC forms provided in Appendix O "Example Forms".

The contractor will obtain and maintain the field-testing instruments, as identified in Section 7.2.6, for analyzing samples in the field by contractor sampling personnel.

Samples on the project site will be collected by the following [specify laboratory or environmental consultant]:

Company Name:

Street Address:

City, State, Zip:

Telephone Number:

Point of Contact:

Name of Sampler(s):

Name of Alternate(s):

The QSP or his/her designee will contact [specify name of laboratory or environmental consultant] 24 hours prior to a predicted rain event or for an unpredicted event, as soon as a rain event begins to ensure that adequate sample collection personnel, supplies for monitoring pH and turbidity are available and will be mobilized to collect samples on the project site in accordance with the sampling schedule.

7.2.4. Field Parameters

Samples shall be analyzed for the constituents indicated in the Table 7.14.

Table 7.14 Sample Collection and Analysis for Monitoring Turbidity and pH

Parameter	Test Method	Minimum Sample Volume [1]	Sample Collection Container Type	Detection Limit (minimum)
Turbidity	Field meter/probe with calibrated portable instrument	500 mL	Polypropylene or glass (Do not collect in meter sample cells)	1 NTU
pH	Field meter/probe with calibrated portable instrument or calibrated pH test kit	100 mL	Polypropylene	0.2 pH units

Notes: [1] Minimum sample volume recommended. Specific volume requirements will vary by instrument; check instrument manufacturer instructions.

L – Liter
mL – Milliliter
NTU – Nephelometric Turbidity Unit

7.2.5. Sample Collection

Samples of discharge shall be collected at the designated runoff and run-on sampling locations shown on the Site Maps in Appendix B. Run-on samples shall be collected within close proximity of the point of run-on to the project.

Only personnel trained in water quality sampling and field measurements working under the direction of the QSP shall collect samples.

Sample collection and handling requirements are described in Section 7.7.

7.2.6. Field Measurements

Samples collected for field analysis, collection, analysis and equipment calibration shall be in accordance with the field instrument manufacturer's specifications.

Immediately following collection, samples for field analysis shall be tested in accordance with the field instrument manufacturer's instructions and results recorded on the *Effluent Sampling Field Log Sheet*.

The field instrument(s) listed in Table 7.15 will be used to analyze the following constituents:

Table 7.15 Field Instruments

Field Instrument (Manufacturer and Model)	Constituent
	pH
	Turbidity

The manufacturers' instructions are included in Appendix P "Field Meter Instructions". Field sampling staff shall review the instructions prior to each sampling event and follow the instructions in completing measurement of the samples.

- The instrument(s) shall be maintained in accordance with manufacturer's instructions.
- The instrument(s) shall be calibrated before each sampling and analysis event.
- Maintenance and calibration records shall be maintained with the SWPPP.

The QSP may authorize alternate equipment provided that the equipment meets the Construction General Permit's requirements and the manufacturers' instructions for calibration and use are added to Appendix P "Field Meter Instructions".

7.2.7. Data Evaluation and Reporting

Immediately upon completing the measurements for the sampling event, provide the *Effluent Sampling Field Log Sheets* to the QSP for evaluation.

Numeric Action Levels

This project is subject to NALs for pH and turbidity (Table 7.16). Compliance with the NAL for pH and turbidity is based on a weighted daily average. Upon receiving the field log sheets, the QSP shall immediately calculate the weighted arithmetic average of the turbidity samples, and the weighted logarithmic average of the pH samples to determine if the NALs, shown in the table below, have been exceeded.

Table 7.16 Numeric Action Levels

Parameter	Unit	Daily Average
pH	pH units	Lower NAL = 6.5 Upper NAL = 8.5
Turbidity	NTU	250 NTU

The QSP shall within [Enter Number] days of the sample collection submit copies of the completed *Effluent Sampling Field Log Sheets* to LADWP representative.

In the event that the pH or turbidity NAL is exceeded, the QSP shall immediately notify LADWP and investigate the cause of the exceedance and identify corrective actions.

Exceedances of NALs shall be electronically reported to the State Water Board by LADWP through the SMARTs system within 10 days of the conclusion of the storm event. If requested by the Regional Board, a NAL Exceedance report will be submitted. The NAL Exceedance Report must contain the following information:

- Analytical method(s), method reporting unit(s), and MDL(s) of each parameter;
- Date, place, time of sampling, visual observation, and/or measurements, including precipitation; and
- Description of the current BMPs associated with the sample that exceeded the NAL and the proposed corrective actions taken.

Receiving Water Monitoring Triggers

This project is not subject to Receiving Water Monitoring Triggers because it does not have a direct discharge to the receiving water.

7.3. Sampling and Analysis Plan for pH, Turbidity, and SSC in Receiving Water

This project is not subject to Receiving Water Monitoring.

7.4. Sampling and Analysis Plan for Non-Stormwater Discharges

The Regional Water Board has not specified monitoring for additional pollutants.

7.5. Training of Sampling Personnel

Sampling personnel shall be trained to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring program (SWAMP) 2008 Quality Assurance Program Plan (QAPrP). Training records of designated contractor sampling personnel are provided in Appendix F.

The stormwater sampler(s) and alternate(s) have received the following stormwater sampling training:

Name	Training
	INSERT LIST OF TRAINING COURSES
	INSERT LIST OF TRAINING COURSES

The stormwater sampler(s) and alternates have the following stormwater sampling experience:

Name	Experience
	INSERT LIST OF STORMWATER SAMPLING EXPERIENCE
	INSERT LIST OF STORMWATER SAMPLING EXPERIENCE

7.6. Sample Collection and Handling

7.6.1. Sample Collection

Samples shall be collected at the designated sampling locations shown on the Site Maps and listed in the preceding sections. Samples shall be collected, maintained and shipped in accordance with the SWAMP 2008 Quality Assurance Program Plan (QAPrP).

Grab samples shall be collected and preserved in accordance with the methods identified in preceding sections.

To maintain sample integrity and prevent cross-contamination, sample collection personnel shall follow the protocols below.

- Collect samples (for laboratory analysis) only in analytical laboratory-provided sample containers;
- Wear clean, powder-free nitrile gloves when collecting samples;
- Change gloves whenever something not known to be clean has been touched;
- Change gloves between sites;
- Decontaminate all equipment (e.g., bucket, tubing) prior to sample collection using a trisodium phosphate water wash, distilled water rinse, and final rinse with distilled water. (Dispose of wash and rinse water appropriately [i.e., do not discharge to storm drain or receiving water]). Do not decontaminate laboratory provided sample containers;
- Do not smoke during sampling events;
- Never sample near a running vehicle;
- Do not park vehicles in the immediate sample collection area (even non-running vehicles);
- Do not eat or drink during sample collection; and
- Do not breathe, sneeze, or cough in the direction of an open sample container.

The most important aspect of grab sampling is to collect a sample that represents the entire runoff stream. Typically, samples are collected by dipping the collection container in the runoff flow paths and streams as noted below.

i. For small streams and flow paths, simply dip the bottle facing upstream until full.
ii. For larger stream that can be safely accessed, collect a sample in the middle of the flow stream by directly dipping the mouth of the bottle. Once again making sure that the opening of the bottle is facing upstream as to avoid any contamination by the sampler.
iii. For larger streams that cannot be safely waded, pole-samplers may be needed to safely access the representative flow.
iv. Avoid collecting samples from ponded, sluggish or stagnant water.
v. Avoid collecting samples directly downstream from a bridge as the samples can be affected by the bridge structure or runoff from the road surface.

Note, that depending upon the specific analytical test, some containers may contain preservatives. These containers should **never** be dipped into the stream but filled indirectly from the collection container.

SSC samples should be taken as a normal grab sample, where the bottle is submerged facing upstream and filled. SSC samples need to be collected in a separate bottle because the analysis requires the entire volume of the bottle. Do not collect in a larger container and partition into the laboratory sample container.

7.6.2. Sample Handling

Turbidity and pH measurements must be conducted immediately. Do not store turbidity or pH samples for later measurement.

Samples for laboratory analysis must be handled as follows. Immediately following sample collection:

- Cap sample containers;
- Complete sample container labels;
- Sealed containers in a re-sealable storage bag;
- Place sample containers into an ice-chilled cooler;

- Document sample information on the *Effluent Sampling Field Log Sheet*; and
- Complete the CoC.

All samples for laboratory analysis must be maintained between 0-6 degrees Celsius during delivery to the laboratory. Samples must be kept on ice, or refrigerated, from sample collection through delivery to the laboratory. Place samples to be shipped inside coolers with ice. Make sure the sample bottles are well packaged to prevent breakage and secure cooler lids with packaging tape.

Ship samples that will be laboratory analyzed to the analytical laboratory right away. Hold times are measured from the time the sample is collected to the time the sample is analyzed. The General Permit requires that samples be received by the analytical laboratory within 48 hours of the physical sampling (unless required sooner by the analytical laboratory).

Laboratory Name:	
Address:	
City, State Zip:	
Telephone Number:	
Point of Contact:	

7.6.3. Sample Documentation Procedures

All original data documented on sample bottle identification labels, *Effluent Sampling Field Log Sheet*, and CoCs shall be recorded using waterproof ink. These shall be considered accountable documents. If an error is made on an accountable document, the individual shall make corrections by lining through the error and entering the correct information. The erroneous information shall not be obliterated. All corrections shall be initialed and dated.

Duplicate samples shall be identified consistent with the numbering system for other samples to prevent the laboratory from identifying duplicate samples. Duplicate samples shall be identified in the Effluent Sampling Field Log Sheet.

Sample documentation procedures include the following:

Sample Bottle Identification Labels: Sampling personnel shall attach an identification label to each sample bottle. Sample identification shall uniquely identify each sample location.

Field Log Sheets: Sampling personnel shall complete the *Effluent Sampling Field Log Sheet* and *Receiving Water Sampling Field Log Sheet* for each sampling event, as appropriate.

Chain of Custody: Sampling personnel shall complete the CoC for each sampling event for which samples are collected for laboratory analysis. The sampler will sign the CoC when the sample(s) is turned over to the testing laboratory or courier.

8. Active Treatment System Monitoring

An Active Treatment System (ATS) will be deployed on the site?

☐ Yes ☒ No

This project does not require a project specific Sampling and Analysis Plan for an ATS because deployment of an ATS is not planned.

9. Bioassessment Monitoring

This project is not subject to bioassessment monitoring because it is not a Risk Level 3 project.

This project is Risk Level 3	☐ Yes	☒ No
This project will disturb more than 30 acres	☐ Yes	☒ No
This project directly discharges runoff to a freshwater wadable stream (or streams) that is either:	☐ Yes	☒ No
a) Listed by the State Water Board or EPA as impaired due to sediment or is tributary to any downstream waterbody that is listed for sediment impairments	☐	
or		
b) Has the beneficial uses of SPAWN and COLD and MIGRATORY	☐	

This project is not subject to bioassessment monitoring because it does not meet both of the permit specified trigger requirements.

10. Watershed Monitoring Option

This project is not participating in a watershed monitoring option.

11. Quality Assurance and Quality Control

An effective Quality Assurance and Quality Control (QA/QC) plan shall be implemented as part of the CSMP to ensure that analytical data can be used with confidence. QA/QC procedures to be initiated include the following:

- Field logs;
- Clean sampling techniques;
- CoCs;
- QA/QC Samples; and
- Data verification.

Each of these procedures is discussed in more detail in the following sections.

11.1. Field Logs

The purpose of field logs is to record sampling information and field observations during monitoring that may explain any uncharacteristic analytical results. Sampling information to be included in the field log include the date and time of water quality sample collection, sampling personnel, sample container identification numbers, and types of samples that were collected. Field observations should be noted in the field log for any abnormalities at the sampling location (color, odor, BMPs, etc.). Field measurements for pH and turbidity should also be recorded in the field log. A Visual Inspection Field Log and an Effluent Sampling Field Log Sheet are included in Appendix O “Example Forms”.

11.2. Clean Sampling Techniques

Clean sampling techniques involve the use of certified clean containers for sample collection and clean powder-free nitrile gloves during sample collection and handling. As discussed in Section 7.7, adoption of a clean sampling approach will minimize the chance of field contamination and questionable data results.

11.3. Chain of Custody

The sample CoC is an important documentation step that tracks samples from collection through analysis to ensure the validity of the sample. Sample CoC procedures include the following:

- Proper labeling of samples;
- Use of CoC forms for all samples; and
- Prompt sample delivery to the analytical laboratory.

Analytical laboratories usually provide CoC forms to be filled out for sample containers. An example CoC is included in Appendix O "Example Forms".

11.4. QA/QC Samples

QA/QC samples provide an indication of the accuracy and precision of the sample collection; sample handling; field measurements; and analytical laboratory methods. The following types of QA/QC will be conducted for this project:

☒ Field Duplicates at a frequency of 5 percent or 1 duplicate minimum per sampling event (Required for all sampling plans with field measurements or laboratory analysis)

☐ Equipment Blanks at a frequency of 1 minimum per sampling event
(Only needed if equipment used to collect samples could add the pollutants to sample)

☐ Field Blanks at a frequency of 1 minimum per sampling event (Only required if sampling method calls for field blanks)

☐ Travel Blanks at a frequency of 1 minimum per sampling event
(Required for sampling plans that include VOC laboratory analysis)

11.4.1. Field Duplicates

Field duplicates provide verification of laboratory or field analysis and sample collection. Duplicate samples shall be collected, handled, and analyzed using the same protocols as primary samples. The sample location where field duplicates are collected shall be randomly selected from the discharge locations. Duplicate samples shall be collected immediately after the primary sample has been collected. Duplicate samples must be collected in the same manner and as close in time as possible to the original sample. Duplicate samples shall not influence any evaluations or conclusion.

11.4.2. Equipment Blanks

Equipment blanks provide verification that equipment has not introduced a pollutant into the sample. Equipment blanks are typically collected when:

- New equipment is used;
- Equipment that has been cleaned after use at a contaminated site;
- Equipment that is not dedicated for surface water sampling is used; or
- Whenever a new lot of filters is used when sampling metals.

11.4.3. Field Blanks

Field blanks assess potential sample contamination levels that occur during field sampling activities. De-ionized water field blanks are taken to the field, transferred to the appropriate container, and treated the same as the corresponding sample type during the course of a sampling event.

11.4.4. Travel Blanks

Travel blanks assess the potential for cross-contamination of volatile constituents between sample containers during shipment from the field to the laboratory. De-ionized water blanks are taken along for the trip and held unopened in the same cooler with the VOC samples.

11.5. Data Verification

After results are received from the analytical laboratory, the QSP shall verify the data to ensure that it is complete, accurate, and the appropriate QA/QC requirements were met. Data must be verified as soon as the data reports are received. Data verification shall include:

- Check the CoC and laboratory reports.
  Make sure all requested analyses were performed and all samples are accounted for in the reports.
- Check laboratory reports to make sure hold times were met and that the reporting levels meet or are lower than the reporting levels agreed to in the contract.
- Check data for outlier values and follow up with the laboratory.
  Occasionally typographical errors, unit reporting errors, or incomplete results are reported and should be easily detected. These errors need to be identified, clarified, and corrected quickly by the laboratory. The QSP should especially note data that is an order of magnitude or more different than similar locations or is inconsistent with previous data from the same location.
- Check laboratory QA/QC results.
  EPA establishes QA/QC checks and acceptable criteria for laboratory analyses. These data are typically reported along with the sample results. The QSP shall evaluate the reported QA/QC data to check for contamination (method, field, and equipment blanks), precision (laboratory matrix spike duplicates), and accuracy (matrix spikes and laboratory control samples). When QA/QC checks are outside acceptable ranges, the laboratory must flag the data, and usually provides an explanation of the potential impact to the sample results.
- Check the data set for outlier values and, accordingly, confirm results and re-analyze samples where appropriate.
  Sample re-analysis should only be undertaken when it appears that some part of the QA/QC resulted in a value out of the accepted range. Sample results may not be discounted unless the analytical laboratory identifies the required QA/QC criteria were not met and confirms this in writing.

Field data including inspections and observations must be verified as soon as the field logs are received, typically at the end of the sampling event. Field data verification shall include:

- Check field logs to make sure all required measurements were completed and appropriately documented;
- Check reported values that appear out of the typical range or inconsistent;
  Follow-up immediately to identify potential reporting or equipment problems, if appropriate, recalibrate equipment after sampling;
- Verify equipment calibrations;

- Review observations noted on the field logs; and
- Review notations of any errors and actions taken to correct the equipment or recording errors.

12. Records Retention

All records of stormwater monitoring information and copies of reports (including Annual Reports) must be retained for a period of at least three years from date of submittal or longer if required by the Regional Water Board.

Results of visual monitoring, field measurements, and laboratory analyses must be kept in the SWPPP along with CoCs, and other documentation related to the monitoring.

Records are to be kept onsite while construction is ongoing. Records to be retained include:

- The date, place, and time of inspections, sampling, visual observations, and/or measurements, including precipitation;
- The individual(s) who performed the inspections, sampling, visual observation, and/or field measurements;
- The date and approximate time of field measurements and laboratory analyses;
- The individual(s) who performed the laboratory analyses;
- A summary of all analytical results, the method detection limits and reporting limits, and the analytical techniques or methods used;
- Rain gauge readings from site inspections;
- QA/QC records and results;
- Calibration records;
- Visual observation and sample collection exemption records;
- The records of any corrective actions and follow-up activities that resulted from analytical results, visual observations, or inspections; and
    - NAL Exceedance Reports.

Predicted Rain Event-Triggered Actions

Below is a list of suggested actions and items to review for this project. Each active Trade should check all material storage areas, stockpiles, waste management areas, vehicle and equipment storage and maintenance, areas of active soil disturbance, and areas of active work to ensure the proper implementation of BMPs. Project-wide BMPs should be checked and cross-referenced to the BMP progress map.

Trade or Activity	Suggested action(s) to perform / item(s) to review prior to rain event
☐ Information & Scheduling	☐ Inform trade supervisors of predicted rain
	☐ Check scheduled activities and reschedule as needed
	☐ Alert erosion/sediment control provider
	☐ Alert sample collection contractor (if applicable)
	☐ Schedule staff for extended rain inspections
	☐ Check Erosion and Sediment Control (ESC) material stock
	☐ Review BMP progress map
	☐ Hours of operation verified for upcoming storm event
	☐ Other:
☐ Material storage areas	☐ Material under cover or in sheds (e.g., treated woods and metals)
	☐ Perimeter control around stockpiles
	☐ Stockpiles covered (as applicable)
	☐ Other:
☐ Waste management areas	☐ Dumpsters closed and drain holes plugged
	☐ Recycling bins covered
	☐ Portable restrooms have secondary containment and protected from tipping over

REAP (Continued)

Trade or Activity, Continued	Suggested action(s) to perform / item(s) to review prior to rain event
☐ Trade operations	☐ Exterior operations shut down for event (e.g., no concrete pours or paving)
	☐ Soil treatments (e.g., fertilizer, soil binder) ceased within 24 hours of event
	☐ Materials and equipment (e.g., tools) properly stored and covered
	☐ Waste and debris disposed in covered dumpsters or removed from site
	☐ Trenches and excavations protected
	☐ Perimeter controls around disturbed areas
	☐ Fueling and repair areas covered and bermed
	☐ Other:
☐ Site ESC BMPs	☐ Adequate capacity in sediment basins and traps
	☐ Site perimeter and slope controls in place
	☐ Catch basin and drop inlet protection in place and cleaned
	☐ Temporary erosion controls deployed
	☐ Roads swept; site ingress and egress points stabilized
	☐ Temporary perimeter controls deployed around disturbed areas and stockpiles
	☐ Other:
☐ Concrete rinse out area	☐ Adequate capacity for rain
	☐ Wash-out bins covered
	☐ Other:
☐ Spill and drips	☐ All incident spills and drips cleaned, including paint, stucco, fuel, and oil cleaned
	☐ Drip pans emptied
	☐ Other:
☐ Other / Discussion / Diagrams	☐ _____
	☐ _____
	☐ _____

I certify under penalty of law that this Rain Event Action Plan (REAP) will be performed in accordance with the General Permit by me or under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

1	**Sediment Risk Factor Worksheet**		**Entry**
2	**A) R Factor**		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	**R Factor Value**		56
6	**B) K Factor (weighted average, by area, for all site soils)**		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	**K Factor Value**		0.24
10	**C) LS Factor (weighted average, by area, for all slopes)**		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table

Soil Erodibility Factor (K)

The K factor can be determined by using the nomograph method, which requires that a particle size analysis (ASTM D-422) be done to determine the percentages of sand, very fine sand, silt and clay. Use the figure below to determine appropriate K value.

Erickson triangular nomograph used to estimate soil erodibility (K) factor.
The figure above is the USDA nomograph used to determine the K factor for a soil, based on its texture (% silt plus very fine sand, % sand, % organic matter, soil structure, and permeability). *Nomograph from Erickson 1977 as referenced in Goldman et. al., 1986.*

Appendix L
Glossary and Acronyms

Best Management Practices (BMPs):	**Any program, technology, process, siting criteria, operational methods or measures, or engineered systems, that when implemented, prevent, control, remove or reduce pollution.**
Clean Water Act:	**The Federal Water Pollution Control Act enacted by Public Law 92-500 as amended by 95-217, 95-576, 96-483, and 97-117; 33 USC. 1251 et seq. Enacted in 1977, the CWA gave EPA the authority to control point-source storm water discharges that convey pollutants to the waters of the United States. Congress amended the CWA in 1987 to create a new section devoted to storm water permitting. In accordance with the 1987 revisions, the EPA adopted regulations in 1990 that established requirements for National Pollutant Discharge Elimination System (NPDES) permits for discharge of storm water from industries and municipalities.**
Contamination:	**"An impairment of the quality of the waters of the state by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease...including any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected." [California Water Code Section 13050(k)].**
General Permit:	**The National Pollutant Discharge Elimination System General Permit for Storm Water Discharges Associated with Construction Activities, issued by the State of California Water Resources Control Board (Water Quality Order 99-08-DWQ, adopted August 1999).**
Good Housekeeping Practices:	**The act of maintaining clean, orderly site areas to prevent potential pollutants from contacting storm water.**
National Pollutant Discharge Elimination System (NPDES):	**A permitting process established pursuant to the Clean Water Act that regulates the release of pollutants to waters of the United States.**
Non-Storm Water Discharge:	**Any discharge to surface waters, to a storm drain, or to any other storm water drainage facility that is not composed entirely of storm water or landscape irrigation runoff.**
Notice of Intent (NOI):	**The NOI is the application form used to obtain the General Construction Permit. The NOI indicates the facility's intent to comply with the terms of the permit.**
Nuisance:	**"Anything which meets all of the following requirements: (1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to**

	interfere with the comfortable enjoyment of life and property; (2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; (3) occurs during or as a result of the treatment or disposal of wastes." [California Water Code Section 13050(m)].
Pollution:	**The "man-made or man-induced alternation of the chemical, physical, biological, and radiological integrity of water." [Clean Water Act Section 502 (19)]. Pollution also means "an alternation of the quality of the waters of the state by waste to a degree which unreasonably affects either...the waters for beneficial uses...or facilities which serve these beneficial uses." [California Water Code Section 13050(l)].**
Regional Water Quality Control Board:	**State agency responsible for administration and enforcement of the municipal and industrial NPDES storm water permits.**
Sanitary Sewer System:	**A network of pipelines carrying sewage to a wastewater treatment facility. Storm drains are separate pipeline and are not connected to sanitary sewers.**
Significant Materials:	**Includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); any chemical the facility is required to report pursuant to Section 313 of Title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges.**
Significant Quantities:	**The volume, concentrations, or mass of a pollutant in storm water discharges that can cause or threaten to cause pollution, contamination, or nuisance; adversely impact human health or the environment; and cause or contribute to a violation of any applicable water quality standards for the receiving water.**
Storm Water:	**Storm water runoff, and surface runoff and drainage. It excludes infiltration and runoff from agricultural land.**
Storm Water Discharge:	**Storm water at the point where it runs off private property onto adjacent property, the street, canals, creeks, the river, or into the municipal storm drain system.**
Storm Water Pollution Prevention Plan (SWPPP):	**The SWPPP is a document that identifies sources and activities at a particular construction site that may contribute pollutants to storm water, and commits the property owner**

	to implement specific control measures to prevent or treat such pollutants.
U.S. Environmental Protection Agency (EPA):	**The federal agency with authority for enacting and enforcing many environmental laws, including the Clean Water Act.**

Acronyms

ASTM	American Society for Testing and Materials
ATS	Active Treatment System
BAT	Best Available Technology Economically Achievable (BAT) is defined at Section 304(b)(2) of the CWA.
BCT	Best Conventional Pollutant Control Technology (BCT) is defined at Section 304(b)(4) of the CWA.
BMP	Best Management Practices

Scheduling EC-1

Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.
- Plan the project and develop a schedule showing each phase of construction. Clearly show how the rainy season relates

to soil disturbing and re-stabilization activities. Incorporate the construction schedule into the SWPPP.

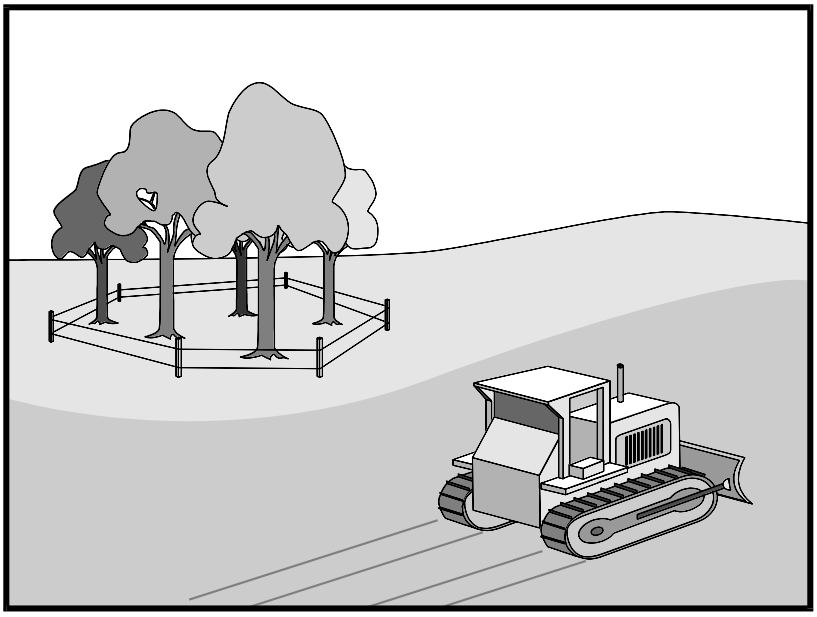
- Include on the schedule, details on the rainy season implementation and deployment of:
  - Erosion control BMPs
  - Sediment control BMPs
  - Tracking control BMPs
  - Wind erosion control BMPs
  - Non-stormwater BMPs
  - Waste management and materials pollution control BMPs
- Include dates for activities that may require non-stormwater discharges such as dewatering, sawcutting, grinding, drilling, boring, crushing, blasting, painting, hydro-demolition, mortar mixing, pavement cleaning, etc.
- Work out the sequencing and timetable for the start and completion of each item such as site clearing and grubbing, grading, excavation, paving, foundation pouring utilities installation, etc., to minimize the active construction area during the rainy season.
  - Sequence trenching activities so that most open portions are closed before new trenching begins.
  - Incorporate staged seeding and re-vegetation of graded slopes as work progresses.
  - Schedule establishment of permanent vegetation during appropriate planting time for specified vegetation.
- Non-active areas should be stabilized as soon as practical after the cessation of soil disturbing activities or one day prior to the onset of precipitation.
- Monitor the weather forecast for rainfall.
- When rainfall is predicted, adjust the construction schedule to allow the implementation of soil stabilization and sediment treatment controls on all disturbed areas prior to the onset of rain.
- Be prepared year-round to deploy erosion control and sediment control BMPs. Erosion may be caused during dry seasons by un-seasonal rainfall, wind, and vehicle tracking. Keep the site stabilized year-round and retain and maintain rainy season sediment trapping devices in operational condition.
- Apply permanent erosion control to areas deemed substantially complete during the project's defined seeding window.
- Avoid soil disturbance during periods with high wind velocities.

Costs

Construction scheduling to reduce erosion may increase other construction costs due to reduced economies of scale in performing site grading. The cost effectiveness of scheduling techniques

should be compared with the other less effective erosion and sedimentation controls to achieve a cost-effective balance.

Inspection and Maintenance



- Verify that work is progressing in accordance with the schedule. If progress deviates, take corrective actions.
- Amend the schedule when changes are warranted.
- Amend the schedule prior to the rainy season to show updated information on the deployment and implementation of construction site BMPs.

Potential Alternatives

None

Description and Purpose

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs, and grasses that protect soil from erosion.

Suitable Applications

Preservation of existing vegetation is suitable for use on most projects. Large project sites often provide the greatest opportunity for use of this BMP. Suitable applications include the following:

- Areas within the site where no construction activity occurs or occurs at a later date. This BMP is especially suitable to multi year projects where grading can be phased.
- Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
- Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc. These areas are usually designated on the plans, or in the specifications, permits, or environmental documents.
- Where vegetation designated for ultimate removal can be temporarily preserved and be utilized for erosion control and sediment control.
- Protecting existing vegetation buffers and swales.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Requires forward planning by the owner/developer, contractor, and design staff.
- Limited opportunities for use when project plans do not incorporate existing vegetation into the site design.
- For sites with diverse topography, it is often difficult and expensive to save existing trees while grading the site satisfactory for the planned development.

Implementation

The best way to prevent erosion is to not disturb the land. In order to reduce the impacts of new development and redevelopment, projects may be designed to avoid disturbing land in sensitive areas of the site (e.g., natural watercourses, steep slopes), and to incorporate unique or desirable existing vegetation into the site's landscaping plan. Clearly marking and leaving a buffer area around these unique areas during construction will help to preserve these areas as well as take advantage of natural erosion prevention and sediment trapping.

Existing vegetation to be preserved on the site must be protected from mechanical and other injury while the land is being developed. The purpose of protecting existing vegetation is to ensure the survival of desirable vegetation for shade, beautification, and erosion control. Mature vegetation has extensive root systems that help to hold soil in place, thus reducing erosion. In addition, vegetation helps keep soil from drying rapidly and becoming susceptible to erosion. To effectively save existing vegetation, no disturbances of any kind should be allowed within a defined area around the vegetation. For trees, no construction activity should occur within the drip line of the tree.

Timing

- Provide for preservation of existing vegetation prior to the commencement of clearing and grubbing operations or other soil disturbing activities in areas where no construction activity is planned or will occur at a later date.

Design and Layout

- Mark areas to be preserved with temporary fencing. Include sufficient setback to protect roots.
  - Orange colored plastic mesh fencing works well.
  - Use appropriate fence posts and adequate post spacing and depth to completely support the fence in an upright position.
- Locate temporary roadways, stockpiles, and layout areas to avoid stands of trees, shrubs, and grass.
- Consider the impact of grade changes to existing vegetation and the root zone.
- Maintain existing irrigation systems where feasible. Temporary irrigation may be required.
- Instruct employees and subcontractors to honor protective devices. Prohibit heavy equipment, vehicular traffic, or storage of construction materials within the protected area.

- Consider pruning or mowing vegetation instead of removing it to allow for regrowth.
- If possible, retain vegetation buffer around the site and adjacent waterways.

Costs

There is little cost associated with preserving existing vegetation if properly planned during the project design, and these costs may be offset by aesthetic benefits that enhance property values. During construction, the cost for preserving existing vegetation will likely be less than the cost of applying erosion and sediment controls to the disturbed area. Replacing vegetation inadvertently destroyed during construction can be extremely expensive, sometimes in excess of $10,000 per tree.

Inspection and Maintenance

During construction, the limits of disturbance should remain clearly marked at all times. Irrigation or maintenance of existing vegetation should be described in the landscaping plan. If damage to protected trees still occurs, maintenance guidelines described below should be followed:

- Verify that protective measures remain in place. Restore damaged protection measures immediately.
- Serious tree injuries shall be attended to by an arborist.
- Damage to the crown, trunk, or root system of a retained tree shall be repaired immediately.
- Trench as far from tree trunks as possible, usually outside of the tree drip line or canopy. Curve trenches around trees to avoid large roots or root concentrations. If roots are encountered, consider tunneling under them. When trenching or tunneling near or under trees to be retained, place tunnels at least 18 in. below the ground surface, and not below the tree center to minimize impact on the roots.
- Do not leave tree roots exposed to air. Cover exposed roots with soil as soon as possible. If soil covering is not practical, protect exposed roots with wet burlap or peat moss until the tunnel or trench is ready for backfill.
- Cleanly remove the ends of damaged roots with a smooth cut.
- Fill trenches and tunnels as soon as possible. Careful filling and tamping will eliminate air spaces in the soil, which can damage roots.
- If bark damage occurs, cut back all loosened bark into the undamaged area, with the cut tapered at the top and bottom and drainage provided at the base of the wood. Limit cutting the undamaged area as much as possible.
- Aerate soil that has been compacted over a trees root zone by punching holes 12 in. deep with an iron bar and moving the bar back and forth until the soil is loosened. Place holes 18 in. apart throughout the area of compacted soil under the tree crown.
- Fertilization:

- Fertilize trees in the late fall or early spring. Although to note, many native species do not require fertilization.

- Apply fertilizer to the soil over the feeder roots and in accordance with label instructions, but never closer than 3 ft to the trunk. Increase the fertilized area by one-fourth of the crown area for conifers that have extended root systems.

- Retain protective measures until all other construction activity is complete to avoid damage during site cleanup and stabilization.

Check Dams SE-4

Description and Purpose

A check dam is a small barrier constructed of rock, gravel bags, sandbags, fiber rolls, or other proprietary products, placed across a constructed swale or drainage ditch. Check dams reduce the effective slope of the channel, thereby reducing scour and channel erosion by reducing flow velocity and increasing residence time within the channel, allowing sediment to settle.

Suitable Applications

Check dams may be appropriate in the following situations:

- To promote sedimentation behind the dam.
- To prevent erosion by reducing the velocity of channel flow in small intermittent channels and temporary swales.
- In small open channels that drain 10 acres or less.
- In steep channels where stormwater runoff velocities exceed 5 ft/s.
- During the establishment of grass linings in drainage ditches or channels.
- In temporary ditches where the short length of service does not warrant establishment of erosion-resistant linings.
- To act as a grade control structure.

SE-12 Manufactured Linear Sediment Controls

SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Not to be used in live streams or in channels with extended base flows.
- Not appropriate in channels that drain areas greater than 10 acres.
- Not appropriate in channels that are already grass-lined unless erosion potential or sediment-laden flow is expected, as installation may damage vegetation.
- Require extensive maintenance following high velocity flows.
- Promotes sediment trapping which can be re-suspended during subsequent storms or removal of the check dam.
- Do not construct check dams with straw bales or silt fence.
- Water suitable for mosquito production may stand behind check dams, particularly if subjected to daily non-stormwater discharges.

Implementation

General

Check dams reduce the effective slope and create small pools in swales and ditches that drain 10 acres or less. Using check dams to reduce channel slope reduces the velocity of stormwater flows, thus reducing erosion of the swale or ditch and promoting sedimentation. Thus, check dams are dual-purpose and serve an important role as erosion controls as well as sediment controls. Note that use of 1-2 isolated check dams for sedimentation will likely result in little net removal of sediment because of the small detention time and probable scour during longer storms. Using a series of check dams will generally increase their effectiveness. A sediment trap (SE-3) may be placed immediately upstream of the check dam to increase sediment removal efficiency.

Design and Layout

Check dams work by decreasing the effective slope in ditches and swales. An important consequence of the reduced slope is a reduction in capacity of the ditch or swale. This reduction in capacity should be considered when using this BMP, as reduced capacity can result in overtopping of the ditch or swale and resultant consequences. In some cases, such as a "permanent" ditch or swale being constructed early and used as a "temporary" conveyance for construction flows, the ditch or swale may have sufficient capacity such that the temporary reduction in capacity due to check dams is acceptable. When check dams reduce capacities beyond acceptable limits, either:

- Don't use check dams. Consider alternative BMPs, or.
- Increase the size of the ditch or swale to restore capacity.

Maximum slope and velocity reduction is achieved when the toe of the upstream dam is at the same elevation as the top of the downstream dam (see "Spacing Between Check Dams" detail at the end of this fact sheet). The center section of the dam should be lower than the edge sections (at least 6 inches), acting as a spillway, so that the check dam will direct flows to the center of

the ditch or swale (see "Typical Rock Check Dam" detail at the end of this fact sheet). Bypass or side-cutting can occur if a sufficient spillway is not provided in the center of the dam.

Check dams are usually constructed of rock, gravel bags, sandbags, and fiber rolls. A number of products can also be used as check dams (e.g. HDPE check dams, temporary silt dikes (SE-12)), and some of these products can be removed and reused. Check dams can also be constructed of logs or lumber and have the advantage of a longer lifespan when compared to gravel bags, sandbags, and fiber rolls. Check dams should not be constructed from straw bales or silt fences, since concentrated flows quickly wash out these materials.

Rock check dams are usually constructed of 8 to 12 in. rock. The rock is placed either by hand or mechanically, but never just dumped into the channel. The dam should completely span the ditch or swale to prevent washout. The rock used should be large enough to stay in place given the expected design flow through the channel. It is recommended that abutments be extended 18 in. into the channel bank. Rock can be graded such that smaller diameter rock (e.g. 2-4 in) is located on the upstream side of larger rock (holding the smaller rock in place); increasing residence time.

Log check dams are usually constructed of 4 to 6 in. diameter logs, installed vertically. The logs should be embedded into the soil at least 18 in. Logs can be bolted or wired to vertical support logs that have been driven or buried into the soil.

See fiber rolls, SE-5, for installation of fiber roll check dams.

Gravel bag and sand bag check dams are constructed by stacking bags across the ditch or swale, shaped as shown in the drawings at the end of this fact sheet (see "Gravel Bag Check Dam" detail at the end of this fact sheet).

Manufactured products, such as temporary silt dikes (SE-12), should be installed in accordance with the manufacturer's instructions. Installation typically requires anchoring or trenching of products, as well as regular maintenance to remove accumulated sediment and debris.

If grass is planted to stabilize the ditch or swale, the check dam should be removed when the grass has matured (unless the slope of the swales is greater than 4%).

The following guidance should be followed for the design and layout of check dams:

- Install the first check dam approximately 16 ft from the outfall device and at regular intervals based on slope gradient and soil type.
- Check dams should be placed at a distance and height to allow small pools to form between each check dam.
- For multiple check dam installation, backwater from a downstream check dam should reach the toes of the upstream check dam.
- A sediment trap provided immediately upstream of the check dam will help capture sediment. Due to the potential for this sediment to be resuspended in subsequent storms, the sediment trap should be cleaned following each storm event.

- High flows (typically a 2-year storm or larger) should safely flow over the check dam without an increase in upstream flooding or damage to the check dam.
- Where grass is used to line ditches, check dams should be removed when grass has matured sufficiently to protect the ditch or swale.

Materials

- Rock used for check dams should typically be 8-12 in rock and be sufficiently sized to stay in place given expected design flows in the channel. Smaller diameter rock (e.g. 2 to 4 in) can be placed on the upstream side of larger rock to increase residence time.
- Gravel bags used for check dams should conform to the requirements of SE-6, Gravel Bag Berms.
- Sandbags used for check dams should conform to SE-8, Sandbag Barrier.
- Fiber rolls used for check dams should conform to SE-5, Fiber Rolls.
- Temporary silt dikes used for check dams should conform to SE-12, Temporary Silt Dikes.

Installation

- Rock should be placed individually by hand or by mechanical methods (no dumping of rock) to achieve complete ditch or swale coverage.
- Tightly abut bags and stack according to detail shown in the figure at the end of this section (pyramid approach). Gravel bags and sandbags should not be stacked any higher than 3 ft.
- Upper rows or gravel and sand bags shall overlap joints in lower rows.
- Fiber rolls should be trenched in, backfilled, and firmly staked in place.
- Install along a level contour.
- HDPE check dams, temporary silt dikes, and other manufactured products should be used and installed per manufacturer specifications.

Costs

Cost consists of labor costs if materials are readily available (such as gravel on-site). If material must be imported, costs will increase. For other material and installation costs, see SE-5, SE-6, SE-8, SE-12, and SE-14.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Replace missing rock, bags, rolls, etc. Replace bags or rolls that have degraded or have become damaged.

- If the check dam is used as a sediment capture device, sediment that accumulates behind the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- If the check dam is used as a grade control structure, sediment removal is not required as long as the system continues to control the grade.
- Inspect areas behind check dams for pools of standing water, especially if subjected to daily non-stormwater discharges.
- Remove accumulated sediment prior to permanent seeding or soil stabilization.
- Remove check dam and accumulated sediment when check dams are no longer needed.

Legend:

☑ **Primary Category**

☒ **Secondary Category**

Description and Purpose

A fiber roll (also known as wattles or logs) consists of straw, coir, curled wood fiber, or other biodegradable materials bound into a tight tubular roll wrapped by plastic netting, which can be photodegradable, or natural fiber, such as jute, cotton, or sisal. Additionally, gravel core fiber rolls are available, which contain an imbedded ballast material such as gravel or sand for additional weight when staking the rolls are not feasible (such as use as inlet protection). When fiber rolls are placed at the toe and on the face of slopes along the contours, they intercept runoff, reduce its flow velocity, release the runoff as sheet flow, and provide removal of sediment from the runoff (through sedimentation). By interrupting the length of a slope, fiber rolls can also reduce sheet and rill erosion until vegetation is established.

Suitable Applications

Fiber rolls may be suitable:

- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.
- At the end of a downward slope where it transitions to a steeper slope.
- Along the perimeter of a project.
- As check dams in unlined ditches with minimal grade.
- Down-slope of exposed soil areas.

SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- At operational storm drains as a form of inlet protection.
- Around temporary stockpiles.

Limitations

- Fiber rolls should be used in conjunction with erosion control, such as hydroseed, RECPs, etc.
- Only biodegradable fiber rolls containing no plastic can remain on a site applying for a Notice of Termination due to plastic pollution and wildlife concerns (State Water Board, 2016). Fiber rolls containing plastic that are used on a site must be disposed of for final stabilization.
- Fiber rolls are not effective unless trenched in and staked. If not properly staked and trenched in, fiber rolls will not work as intended and could be transported by high flows.
- Not intended for use in high flow situations (i.e., for concentrated flows).
- Difficult to move once saturated.
- Fiber rolls have a limited sediment capture zone.
- Fiber rolls should not be used on slopes subject to creep, slumping, or landslide.
- Rolls typically function for 12-24 months, depending upon local conditions and roll material.

Implementation

Fiber Roll Materials

- Fiber rolls should be prefabricated.
- Fiber rolls may come manufactured containing polyacrylamide (PAM), a flocculating agent within the roll. Fiber rolls impregnated with PAM provide additional sediment removal capabilities and should be used in areas with fine, clayey or silty soils to provide additional sediment removal capabilities. Monitoring may be required for these installations.
- Fiber rolls are made from weed-free rice straw, flax, curled wood fiber, or coir bound into a tight tubular roll by netting or natural fiber (see *Limitations* above regarding plastic netting).
- Typical fiber rolls vary in diameter from 6 in. to 20 in. Larger diameter rolls are available as well. The larger the roll, the higher the sediment retention capacity.
- Typical fiber rolls lengths are 4, 10, 20 and 25 ft., although other lengths are likely available.

Installation

- Locate fiber rolls on level contours spaced as follows:
  - Slope inclination of 4:1 (H:V) or flatter: Fiber rolls should be placed at a maximum interval of 20 ft.

  - Slope inclination between 4:1 and 2:1 (H:V): Fiber Rolls should be placed at a maximum interval of 15 ft. (a closer spacing is more effective).

  - Slope inclination 2:1 (H:V) or greater: Fiber Rolls should be placed at a maximum interval of 10 ft. (a closer spacing is more effective).

- Prepare the slope before beginning installation.

- Dig small trenches across the slope on the contour. The trench depth should be ¼ to 1/3 of the thickness of the roll, and the width should equal the roll diameter, in order to provide area to backfill the trench.

- It is critical that rolls are installed perpendicular to water movement, and parallel to the slope contour.

- Start building trenches and installing rolls from the bottom of the slope and work up.

- It is recommended that pilot holes be driven through the fiber roll. Use a straight bar to drive holes through the roll and into the soil for the wooden stakes.

- Turn the ends of the fiber roll up slope to prevent runoff from going around the roll.

- Stake fiber rolls into the trench.

  - Drive stakes at the end of each fiber roll and spaced 4 ft maximum on center.

  - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.

- If more than one fiber roll is placed in a row, the rolls should be overlapped, not abutted.

- See typical fiber roll installation details at the end of this fact sheet.

Removal

- Fiber rolls can be left in place or removed depending on the type of fiber roll and application (temporary vs. permanent installation). Fiber rolls encased with plastic netting or containing any plastic material will need to be removed from the site for final stabilization. Fiber rolls used in a permanent application are to be encased with a non-plastic material and are left in place. Removal of a fiber roll used in a permanent application can result in greater disturbance; therefore, during the BMP planning phase, the areas where fiber rolls will be used on final slopes, only fiber rolls wrapped in non-plastic material should be selected.

- Temporary installations should only be removed when up gradient areas are stabilized per General Permit requirements, and/or pollutant sources no longer present a hazard. But they should also be removed before vegetation becomes too mature so that the removal process does not disturb more soil and vegetation than is necessary.

Costs

Material costs for straw fiber rolls range from $26 - $38 per 25-ft. roll[1] and curled wood fiber rolls range from $30 - $40 per roll[2].

Material costs for PAM impregnated fiber rolls range between $9.00-$12.00 per linear foot, based upon vendor research[1] .

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Repair or replace split, torn, unraveling, or slumping fiber rolls.
- If the fiber roll is used as a sediment capture device, or as an erosion control device to maintain sheet flows, sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when sediment accumulation reaches one-third the designated sediment storage depth.
- If fiber rolls are used for erosion control, such as in a check dam, sediment removal should not be required as long as the system continues to control the grade. Sediment control BMPs will likely be required in conjunction with this type of application.
- Repair any rills or gullies promptly.

Gravel Bag Berm SE-6

Description and Purpose

A gravel bag berm is a series of gravel-filled bags placed on a level contour to intercept sheet flows. Gravel bags pond sheet flow runoff, allowing sediment to settle out, and release runoff slowly as sheet flow, preventing erosion.

Suitable Applications

Gravel bag berms may be suitable:

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes
  - As sediment traps at culvert/pipe outlets
  - Below other small cleared areas
  - Along the perimeter of a site
  - Down slope of exposed soil areas
  - Around temporary stockpiles and spoil areas
  - Parallel to a roadway to keep sediment off paved areas
  - Along streams and channels
- As a linear erosion control measure:
  - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

SE-8 Sandbag Barrier

SE-12 Temporary Silt Dike

SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- At the top of slopes to divert runoff away from disturbed slopes.
- As chevrons (small check dams) across mildly sloped construction roads. For use check dam use in channels, see SE-4, Check Dams.

Limitations

- Gravel berms may be difficult to remove.
- Removal problems limit their usefulness in landscaped areas.
- Gravel bag berm may not be appropriate for drainage areas greater than 5 acres.
- Runoff will pond upstream of the berm, possibly causing flooding if sufficient space does not exist.
- Degraded gravel bags may rupture when removed, spilling contents.
- Installation can be labor intensive.
- Durability of gravel bags is somewhat limited, and bags may need to be replaced when installation is required for longer than 6 months.
- Easily damaged by construction equipment.
- When used to detain concentrated flows, maintenance requirements increase.

Implementation

General

A gravel bag berm consists of a row of open graded gravel-filled bags placed on a level contour. When appropriately placed, a gravel bag berm intercepts and slows sheet flow runoff, causing temporary ponding. The temporary ponding allows sediment to settle. The open graded gravel in the bags is porous, which allows the ponded runoff to flow slowly through the bags, releasing the runoff as sheet flows. Gravel bag berms also interrupt the slope length and thereby reduce erosion by reducing the tendency of sheet flows to concentrate into rivulets, which erode rills, and ultimately gullies, into disturbed, sloped soils. Gravel bag berms are similar to sand bag barriers but are more porous. Generally, gravel bag berms should be used in conjunction with temporary soil stabilization controls up slope to provide effective erosion and sediment control.

Design and Layout

- Locate gravel bag berms on level contours.
- When used for slope interruption, the following slope/sheet flow length combinations apply:
  - Slope inclination of 4:1 (H:V) or flatter: Gravel bags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
  - Slope inclination between 4:1 and 2:1 (H:V): Gravel bags should be placed at a maximum interval of 15 ft. (a closer spacing is more effective), with the first row near the slope toe.

Slope inclination 2:1 (H:V) or greater: Gravel bags should be placed at a maximum interval of 10 ft. (a closer spacing is more effective), with the first row near the slope toe.

- Turn the ends of the gravel bag barriers up slope to prevent runoff from going around the berm.
- Allow sufficient space up slope from the gravel bag berm to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, gravel bag barriers should be set back from the slope toe to facilitate cleaning. Where specific site conditions do not allow for a set-back, the gravel bag barrier may be constructed on the toe of the slope. To prevent flows behind the barrier, bags can be placed perpendicular to a berm to serve as cross barriers.
- Drainage area should not exceed 5 acres.
- In Non-Traffic Areas:
  - Height = 18 in. maximum
  - Top width = 24 in. minimum for three or more-layer construction
  - Top width = 12 in. minimum for one- or two-layer construction
  - Side slopes = 2:1 (H:V) or flatter
- In Construction Traffic Areas:
  - Height = 12 in. maximum
  - Top width = 24 in. minimum for three or more-layer construction.
  - Top width = 12 in. minimum for one- or two-layer construction.
  - Side slopes = 2:1 (H:V) or flatter.
- Butt ends of bags tightly.
- On multiple row, or multiple layer construction, overlap butt joints of adjacent row and row beneath.
- Use a pyramid approach when stacking bags.

Materials

- ***Bag Material:*** Bags should be woven polypropylene, polyethylene or polyamide fabric or burlap, minimum unit weight of 4 ounces/yd^2, Mullen burst strength exceeding 300 lb/in^2 in conformance with the requirements in ASTM designation D3786, and ultraviolet stability exceeding 70% in conformance with the requirements in ASTM designation D4355.

- ***Bag Size:*** Each gravel-filled bag should have a length of 18 in., width of 12 in., thickness of 3 in., and mass of approximately 33 lbs. Bag dimensions are nominal and may vary based on locally available materials.

- ***Fill Material:*** Fill material should be 0.5 to 1 in. Crushed rock, clean and free from clay, organic matter, and other deleterious material, or other suitable open graded, non-cohesive, porous gravel.

Costs

Material costs for gravel bags are average and are dependent upon material availability. $3.20-$3.80 per filled gravel bag is standard based upon vendor research (Adjusted for inflation, 2016 dollars, by Tetra Tech, Inc.).

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Gravel bags exposed to sunlight will need to be replaced every two to three months due to degrading of the bags.

- Reshape or replace gravel bags as needed.

- Repair washouts or other damage as needed.

- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.

- Remove gravel bag berms when no longer needed and recycle gravel fill whenever possible and properly dispose of bag material. Remove sediment accumulation and clean, re-grade, and stabilize the area.

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations

- Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).
- Sweeping may be less effective for fine particle soils (i.e., clay).

Implementation

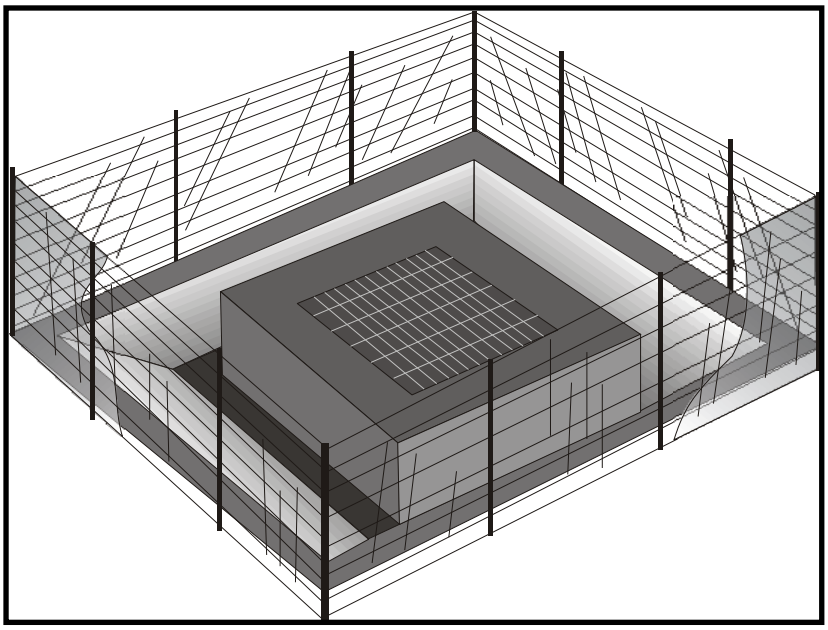
- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused and perhaps save money.
- Inspect potential sediment tracking locations daily.

- Visible sediment tracking should be swept or vacuumed on a daily basis.
- Do not use kick brooms or sweeper attachments. These tend to spread the dirt rather than remove it.
- If not mixed with debris or trash, consider incorporating the removed sediment back into the project

Costs

Rental rates for self-propelled sweepers vary depending on hopper size and duration of rental. Expect rental rates from $ 650/day to $2,500/day[1], plus operator costs. Hourly production rates vary with the amount of area to be swept and amount of sediment. Match the hopper size to the area and expect sediment load to minimize time spent dumping.

Inspection and Maintenance



- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- When actively in use, points of ingress and egress must be inspected daily.
- When tracked or spilled sediment is observed outside the construction limits, it must be removed at least daily. More frequent removal, even continuous removal, may be required in some jurisdictions.
- Be careful not to sweep up any unknown substance or any object that may be potentially hazardous.
- Adjust brooms frequently; maximize efficiency of sweeping operations.
- After sweeping is finished, properly dispose of sweeper wastes at an approved dumpsite.

Storm Drain Inlet Protection SE-10

Description and Purpose

Storm drain inlet protection consists of a sediment filter or an impounding area in, around or upstream of a storm drain, drop inlet, or curb inlet. Storm drain inlet protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Some filter configurations also remove sediment by filtering, but usually the ponding action results in the greatest sediment reduction. Temporary geotextile storm drain inserts attach underneath storm drain grates to capture and filter storm water.

Suitable Applications

- Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas should be protected. Inlet protection should be used in conjunction with other erosion and sediment controls to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.

Limitations

- Drainage area should not exceed 1 acre.
- In general straw bales should not be used as inlet protection.
- Requires an adequate area for water to pond without encroaching into portions of the roadway subject to traffic.
- Sediment removal may be inadequate to prevent sediment discharges in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

other onsite sediment trapping techniques in conjunction with inlet protection.

- Frequent maintenance is required.
- Limit drainage area to 1 acre maximum. For drainage areas larger than 1 acre, runoff should be routed to a sediment-trapping device designed for larger flows. See BMPs SE-2, Sediment Basin, and SE-3, Sediment Traps.
- Excavated drop inlet sediment traps are appropriate where relatively heavy flows are expected, and overflow capability is needed.

Implementation

General

Inlet control measures presented in this handbook should not be used for inlets draining more than one acre. Runoff from larger disturbed areas should be first routed through SE-2, Sediment Basin or SE-3, Sediment Trap and/or used in conjunction with other drainage control, erosion control, and sediment control BMPs to protect the site. Different types of inlet protection are appropriate for different applications depending on site conditions and the type of inlet. Alternative methods are available in addition to the methods described/shown herein such as prefabricated inlet insert devices, or gutter protection devices.

Design and Layout

Identify existing and planned storm drain inlets that have the potential to receive sediment-laden surface runoff. Determine if storm drain inlet protection is needed and which method to use.

- The key to successful and safe use of storm drain inlet protection devices is to know where runoff that is directed toward the inlet to be protected will pond or be diverted as a result of installing the protection device.
  - Determine the acceptable location and extent of ponding in the vicinity of the drain inlet. The acceptable location and extent of ponding will influence the type and design of the storm drain inlet protection device.
  - Determine the extent of potential runoff diversion caused by the storm drain inlet protection device. Runoff ponded by inlet protection devices may flow around the device and towards the next downstream inlet. In some cases, this is acceptable; in other cases, serious erosion or downstream property damage can be caused by these diversions. The possibility of runoff diversions will influence whether or not storm drain inlet protection is suitable; and, if suitable, the type and design of the device.
- The location and extent of ponding, and the extent of diversion, can usually be controlled through appropriate placement of the inlet protection device. In some cases, moving the inlet protection device a short distance upstream of the actual inlet can provide more efficient sediment control, limit ponding to desired areas, and prevent or control diversions.
- Seven types of inlet protection are presented below. However, it is recognized that other effective methods and proprietary devices exist and may be selected.

- Silt Fence: Appropriate for drainage basins with less than a 5% slope, sheet flows, and flows under 0.5 cfs.

- Excavated Drop Inlet Sediment Trap: An excavated area around the inlet to trap sediment (SE-3).

- Gravel bag barrier: Used to create a small sediment trap upstream of inlets on sloped, paved streets. Appropriate for sheet flow or when concentrated flow may exceed 0.5 cfs, and where overtopping is required to prevent flooding.

- Block and Gravel Filter: Appropriate for flows greater than 0.5 cfs.

- Temporary Geotextile Storm drain Inserts: Different products provide different features. Refer to manufacturer details for targeted pollutants and additional features.

- Biofilter Bag Barrier: Used to create a small retention area upstream of inlets and can be located on pavement or soil. Biofilter bags slowly filter runoff allowing sediment to settle out. Appropriate for flows under 0.5 cfs.

- Compost Socks: Allow filtered run-off to pass through the compost while retaining sediment and potentially other pollutants (SE-13). Appropriate for flows under 1.0 cfs.

- Select the appropriate type of inlet protection and design as referred to or as described in this fact sheet.

- Provide area around the inlet for water to pond without flooding structures and property.

- Grates and spaces around all inlets should be sealed to prevent seepage of sediment-laden water.

- Excavate sediment sumps (where needed) 1 to 2 ft with 2:1 side slopes around the inlet.

Installation

- ***DI Protection Type 1 - Silt Fence -*** Similar to constructing a silt fence; see BMP SE-1, Silt Fence. Do not place fabric underneath the inlet grate since the collected sediment may fall into the drain inlet when the fabric is removed or replaced and water flow through the grate will be blocked resulting in flooding. See typical Type 1 installation details at the end of this fact sheet.

  1. Excavate a trench approximately 6 in. wide and 6 in. deep along the line of the silt fence inlet protection device.

  2. Place 2 in. by 2 in. wooden stakes around the perimeter of the inlet a maximum of 3 ft apart and drive them at least 18 in. into the ground or 12 in. below the bottom of the trench. The stakes should be at least 48 in.

  3. Lay fabric along bottom of trench, up side of trench, and then up stakes. See SE-1, Silt Fence, for details. The maximum silt fence height around the inlet is 24 in.

  4. Staple the filter fabric (for materials and specifications, see SE-1, Silt Fence) to wooden stakes. Use heavy-duty wire staples at least 1 in. in length.

5. Backfill the trench with gravel or compacted earth all the way around.

- ***DI Protection Type 2 - Excavated Drop Inlet Sediment Trap -*** Install filter fabric fence in accordance with DI Protection Type 1. Size excavated trap to provide a minimum storage capacity calculated at the rate 67 yd^3/acre of drainage area. See typical Type 2 installation details at the end of this fact sheet.

- ***DI Protection Type 3 - Gravel bag -*** Flow from a severe storm should not overtop the curb. In areas of high clay and silts, use filter fabric and gravel as additional filter media. Construct gravel bags in accordance with SE-6, Gravel Bag Berm. Gravel bags should be used due to their high permeability. See typical Type 3 installation details at the end of this fact sheet.

  1. Construct on gently sloping street.

  2. Leave room upstream of barrier for water to pond and sediment to settle.

  3. Place several layers of gravel bags – overlapping the bags and packing them tightly together.

  4. Leave gap of one bag on the top row to serve as a spillway. Flow from a severe storm (e.g., 10-year storm) should not overtop the curb.

- ***DI Protection Type 4 – Block and Gravel Filter -*** Block and gravel filters are suitable for curb inlets commonly used in residential, commercial, and industrial construction. See typical Type 4 installation details at the end of this fact sheet.

  1. Place hardware cloth or comparable wire mesh with 0.5 in. openings over the drop inlet so that the wire extends a minimum of 1 ft beyond each side of the inlet structure. If more than one strip is necessary, overlap the strips. Place woven geotextile over the wire mesh.

  2. Place concrete blocks lengthwise on their sides in a single row around the perimeter of the inlet, so that the open ends face outward, not upward. The ends of adjacent blocks should abut. The height of the barrier can be varied, depending on design needs, by stacking combinations of blocks that are 4 in., 8 in., and 12 in. wide. The row of blocks should be at least 12 in. but no greater than 24 in. high.

  3. Place wire mesh over the outside vertical face (open end) of the concrete blocks to prevent stone from being washed through the blocks. Use hardware cloth or comparable wire mesh with 0.5 in. opening.

  4. Pile washed stone against the wire mesh to the top of the blocks. Use 0.75 to 3 in.

- ***DI Protection Type 5 – Temporary Geotextile Insert (proprietary) –*** Many types of temporary inserts are available. Most inserts fit underneath the grate of a drop inlet or inside of a curb inlet and are fastened to the outside of the grate or curb. These inserts are removable, and many can be cleaned and reused. Installation of these inserts differs between manufacturers. Please refer to manufacturer instruction for installation of proprietary devices.

- ***DI Protection Type 6 - Biofilter bags*** – Biofilter bags may be used as a substitute for gravel bags in low-flow situations. Biofilter bags should conform to specifications detailed in SE-14, Biofilter bags.

    1. Construct in a gently sloping area.
    2. Biofilter bags should be placed around inlets to intercept runoff flows.
    3. All bag joints should overlap by 6 in.
    4. Leave room upstream for water to pond and for sediment to settle out.
    5. Stake bags to the ground as described in the following detail. Stakes may be omitted if bags are placed on a paved surface.

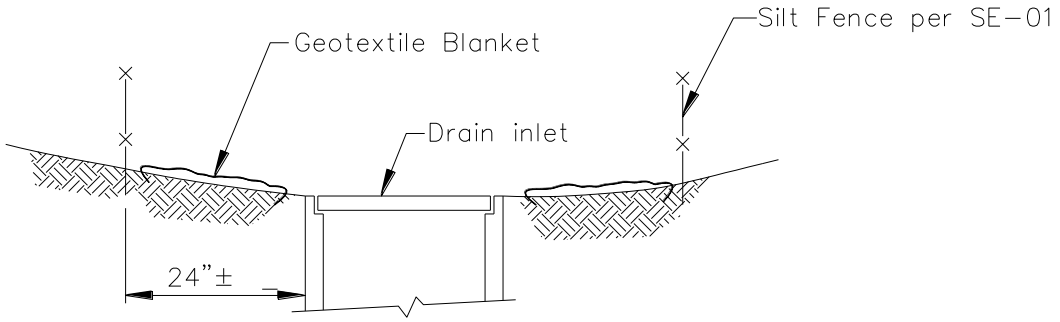
- ***DI Protection Type 7 – Compost Socks*** – A compost sock can be assembled on site by filling a mesh sock (e.g., with a pneumatic blower). Compost socks do not require special trenching compared to other sediment control methods (e.g., silt fence). Compost socks should conform to specification detailed in SE-13, Compost Socks and Berms.

Costs

- Average annual cost for installation and maintenance of DI Type 1-4 and 6 (one-year useful life) is $200 per inlet.
- Temporary geotextile inserts are proprietary, and cost varies by region. These inserts can often be reused and may have greater than 1 year of use if maintained and kept undamaged. Average cost per insert ranges from $50-75 plus installation, but costs can exceed $100. This cost does not include maintenance.
- See SE-13 for Compost Sock cost information.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Silt Fences. If the fabric becomes clogged, torn, or degrades, it should be replaced. Make sure the stakes are securely driven in the ground and are in good shape (i.e., not bent, cracked, or splintered, and are reasonably perpendicular to the ground). Replace damaged stakes. At a minimum, remove the sediment behind the fabric fence when accumulation reaches one-third the height of the fence or barrier height.
- Gravel Filters. If the gravel becomes clogged with sediment, it should be carefully removed from the inlet and either cleaned or replaced. Since cleaning gravel at a construction site may be difficult, consider using the sediment-laden stone as fill material and put fresh stone around the inlet. Inspect bags for holes, gashes, and snags, and replace bags as needed. Check gravel bags for proper arrangement and displacement.



- Sediment that accumulates in the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Inspect and maintain temporary geotextile insert devices according to manufacturer's specifications.
- Remove storm drain inlet protection once the drainage area is stabilized.
    - Clean and regrade area around the inlet and clean the inside of the storm drain inlet, as it should be free of sediment and debris at the time of final inspection.

Potential Alternatives

EC-5 Soil Binders

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.

California's Mediterranean climate, with a short "wet" season and a typically long, hot "dry" season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking, and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water-based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Soils and debris storage piles
- Batch drop from front-end loaders
- Areas with unstabilized soil
- Final grading/site stabilization

Limitations

- Watering prevents dust only for a short period (generally less than a few hours) and should be applied daily (or more often) to be effective.
- Over watering may cause erosion and track-out.
- Oil or oil-treated subgrade should not be used for dust control because the oil may migrate into drainageways and/or seep into the soil.
- Chemical dust suppression agents may have potential environmental impacts. Selected chemical dust control agents should be environmentally benign.
- Effectiveness of controls depends on soil, temperature, humidity, wind velocity and traffic.
- Chemical dust suppression agents should not be used within 100 feet of wetlands or water bodies.
- Chemically treated subgrades may make the soil water repellant, interfering with long-term infiltration and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.
- If the soil surface has minimal natural moisture, the affected area may need to be pre-wetted so that chemical dust control agents can uniformly penetrate the soil surface.

Implementation

Dust Control Practices

Dust control BMPs generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. The following table presents dust control practices that can be applied to varying site conditions that could potentially cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching can be employed for areas of occasional or no construction traffic. Preventive measures include minimizing surface areas to be disturbed, limiting onsite vehicle traffic to 15 mph or less, and controlling the number and activity of vehicles on a site at any given time.

Chemical dust suppressants include: mulch and fiber based dust palliatives (e.g. paper mulch with gypsum binder), salts and brines (e.g. calcium chloride, magnesium chloride), non-petroleum based organics (e.g. vegetable oil, lignosulfonate), petroleum based organics (e.g. asphalt emulsion, dust oils, petroleum resins), synthetic polymers (e.g. polyvinyl acetate, vinyl, acrylic), clay additives (e.g. bentonite, montmorillonite) and electrochemical products (e.g. enzymes, ionic products).

Site Condition	Dust Control Practices							
	Permanent Vegetation	Mulching	Wet Suppression (Watering)	Chemical Dust Suppression	Gravel or Asphalt	Temporary Gravel Construction Entrances/Equipment Wash Down	Synthetic Covers	Minimize Extent of Disturbed Area
Disturbed Areas not Subject to Traffic	x	x	x	x	x			x
Disturbed Areas Subject to Traffic			x	x	x	x		x
Material Stockpiles		x	x	x			x	x
Demolition			x			x	x	
Clearing/ Excavation			x	x				x
Truck Traffic on Unpaved Roads			x	x	x	x	x	
Tracking					x	x		

Additional preventive measures include:

- Schedule construction activities to minimize exposed area (see EC-1, Scheduling).
- Quickly treat exposed soils using water, mulching, chemical dust suppressants, or stone/gravel layering.
- Identify and stabilize key access points prior to commencement of construction.
- Minimize the impact of dust by anticipating the direction of prevailing winds.
- Restrict construction traffic to stabilized roadways within the project site, as practicable.
- Water should be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment should be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
- If reclaimed waste water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality

Control Board (RWQCB) requirements. Non-potable water should not be conveyed in tanks or drain pipes that will be used to convey potable water and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes, and other conveyances should be marked, "NON-POTABLE WATER - DO NOT DRINK."

- Pave or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for rapid clean up of sediments deposited on paved roads. Furnish stabilized construction road entrances and wheel wash areas.
- Stabilize inactive areas of construction sites using temporary vegetation or chemical stabilization methods.

For chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. If chemical stabilization is used, the chemicals should not create any adverse effects on stormwater, plant life, or groundwater and should meet all applicable regulatory requirements.

Costs

Installation costs for water and chemical dust suppression vary based on the method used and the length of effectiveness. Annual costs may be high since some of these measures are effective for only a few hours to a few days.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check areas protected to ensure coverage.
- Most water-based dust control measures require frequent application, often daily or even multiple times per day. Obtain vendor or independent information on longevity of chemical dust suppressants.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

Implementation

General

A stabilized construction entrance is a pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right of way, street, alley, sidewalk, or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights of way or streets. Reducing tracking of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving the construction site, a stabilized construction entrance should be used. NPDES permits require that appropriate measures be implemented to prevent tracking of sediments onto paved roadways, where a significant source of sediments is derived from mud and dirt carried out from unpaved roads and construction sites.

Stabilized construction entrances are moderately effective in removing sediment from equipment leaving a construction site. The entrance should be built on level ground. Advantages of the Stabilized Construction Entrance/Exit is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance/exit.

Design and Layout

- Construct on level ground where possible.
- Select 3 to 6 in. diameter stones.
- Use minimum depth of stones of 12 in. or as recommended by soils engineer.
- Construct length of 50 ft or maximum site will allow, and 10 ft minimum width or to accommodate traffic.
- Rumble racks constructed of steel panels with ridges and installed in the stabilized entrance/exit will help remove additional sediment and to keep adjacent streets clean.
- Provide ample turning radii as part of the entrance.
- Limit the points of entrance/exit to the construction site.
- Limit speed of vehicles to control dust.
- Properly grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment trapping device before discharge.
- Design stabilized entrance/exit to support heaviest vehicles and equipment that will use it.

Stabilized Construction Entrance/Exit TC-1

- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. Do not use asphalt concrete (AC) grindings for stabilized construction access/roadway.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth, or place aggregate to a depth recommended by a geotechnical engineer. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.
- Designate combination or single purpose entrances and exits to the construction site.
- Require that all employees, subcontractors, and suppliers utilize the stabilized construction access.
- Implement SE-7, Street Sweeping and Vacuuming, as needed.
- All exit locations intended to be used for more than a two-week period should have stabilized construction entrance/exit BMPs.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMPs are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect local roads adjacent to the site daily. Sweep or vacuum to remove visible accumulated sediment.
- Remove aggregate, separate and dispose of sediment if construction entrance/exit is clogged with sediment.
- Keep all temporary roadway ditches clear.
- Check for damage and repair as needed.
- Replace gravel material when surface voids are visible.
- Remove all sediment deposited on paved roadways within 24 hours.
- Remove gravel and filter fabric at completion of construction

Costs

Average annual cost for installation and maintenance may vary from $1,500 to $6,100 each, averaging $3,100 per entrance. Costs will increase with addition of washing rack and sediment trap. With wash rack, costs range from $1,500 - $7,700 each, averaging $4,600 per entrance (All costs adjusted for inflation, 2016 dollars, by Tetra Tech Inc.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations

- None identified.

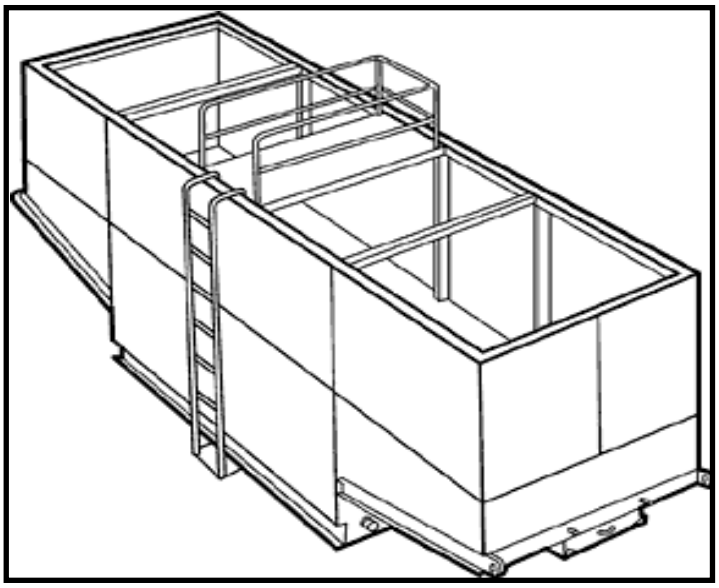
Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

- Direct construction water runoff to areas where it can soak into the ground or be collected and used.
- Authorized non-stormwater discharges to the storm drain system, channels, or receiving waters are acceptable with the implementation of appropriate BMPs.
- Lock water tank valves to prevent unauthorized use.

Costs

The cost is small to none compared to the benefits of conserving water.



Inspection and Maintenance

- Inspect and verify that activity based BMPs are in place prior to the commencement of authorized non-stormwater discharges.
- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges are occuring.
- Repair water equipment as needed to prevent unintended discharges.
  - Water trucks
  - Water reservoirs (water buffalos)
  - Irrigation systems
  - Hydrant connections

SE-5: Fiber Roll

SE-6: Gravel Bag Berm

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.

The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

precipitation (stormwater) from depressed areas at a construction site.

Stormwater mixed with non-stormwater should be managed as non-stormwater.

Limitations

- Dewatering operations will require and should comply with applicable local and project-specific permits and regulations. In some areas, all dewatering activities, regardless of the discharge volume, require a dewatering permit.
- Site conditions will dictate design and use of dewatering operations.
- The controls discussed in this fact sheet primarily address sediment. Other secondary pollutant removal benefits are discussed where applicable.
- The controls detailed in this fact sheet only allow for minimal settling time for sediment particles. Use only when site conditions restrict the use of the other control methods.
- Avoid dewatering discharges where possible by using the water for dust control.

Implementation

- A Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP).
- Regional Water Quality Control Board (RWQCB) Regions may require notification and approval prior to any discharge of water from construction sites.
- The destination of discharge from dewatering activities will typically determine the type of permit required for the discharge. For example, when discharging to a water of the U.S., a dewatering permit may be required through the site's governing RWQCB. When discharging to a sanitary sewer or Municipal Separate Storm Sewer System (MS4), a permit may need to be obtained from the owner of the sanitary sewer or MS4 in addition to obtaining an RWQCB dewatering permit. Additional permits or permissions from other agencies may be required for dewatering cofferdams or diversions.
- Dewatering discharges should not cause erosion at the discharge point. Appropriate BMPs should be implemented to maintain compliance with all applicable permits.
- Maintain dewatering records in accordance with all local and project-specific permits and regulations.

Sediment Treatment

A variety of methods can be used to treat water during dewatering operations. Several devices are presented below and provide options to achieve sediment removal. The sediment particle size and permit or receiving water limitations on sediment or turbidity are key considerations for selecting sediment treatment option(s); in some cases, the use of multiple devices may be appropriate. Use of other enhanced treatment methods (i.e., introduction of chemicals or electric current to enhance flocculation and removal of sediment) must comply with: 1) for storm drain or surface water discharges, the requirements for Active Treatment Systems (see SE-11); or 2) for sanitary sewer discharges, the requirements of applicable sanitary sewer discharge permits.

Sediment Basin (see also SE-2)

Description:

- A sediment basin is a temporary basin with a controlled release structure that is formed by excavation or construction of an embankment to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment basins are generally larger than Sediment Traps (SE-3) and have a designed outlet structure.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, silt, some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Temporary sediment basins should be fenced if safety is a concern.
- Outlet protection is required to prevent erosion at the outfall location.

Maintenance:

- Maintenance is required for safety fencing, vegetation, embankment, inlet and outlet, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

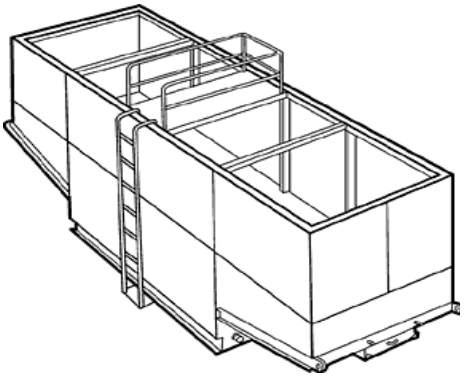
Sediment Trap (See also SE-3)

Description:

- A sediment trap is a temporary basin formed by excavation and/or construction of an earthen embankment across a waterway or low drainage area to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment traps are generally smaller than Sediment Basins (SE-2) and do not have a designed outlet (but do have a spillway or overflow).

Appropriate Applications:

Effective for the removal of large and medium sized particles (sand and gravel) and some metals that settle out with the sediment.



Implementation:

- Excavation and construction of related facilities is required.
- Trap inlets should be located to maximize the travel distance to the trap outlet.
- Use rock or vegetation to protect the trap outlets against erosion.

Maintenance:

- Maintenance is required for vegetation, embankment, inlet and outfall structures, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Weir Tanks

Description:

- A weir tank separates water and waste by using weirs. The configuration of the weirs (over and under weirs) maximizes the residence time in the tank and determines the waste to be removed from the water, such as oil, grease, and sediments.

Appropriate Applications:

- The tank removes trash, some settleable solids (gravel, sand, and silt), some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.
- Treatment capacity (i.e., volume and number of tanks) should provide at a minimum the required volume for discrete particle settling for treatment design flows.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by a licensed waste disposal company.

Dewatering Tanks

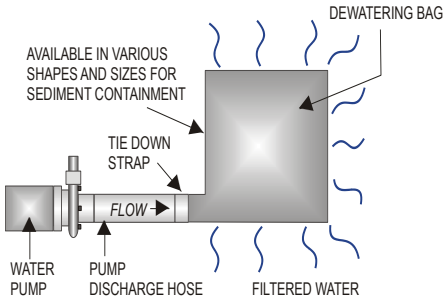
Description:

- A dewatering tank removes debris and sediment. Flow enters the tank through the top, passes through a fabric filter, and is discharged through the bottom of the tank. The filter separates the solids from the liquids.

Appropriate Applications:

- The tank removes trash, gravel, sand, and silt, some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:



- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by licensed waste disposal company.

Gravity Bag Filter

Description:

- A gravity bag filter, also referred to as a dewatering bag, is a square or rectangular bag made of non-woven geotextile fabric that collects gravel, sand, silt, and fines.

Appropriate Applications:

- Effective for the removal of sediments (gravel, sand, silt, and fines). Some metals are removed with the sediment.

Implementation:

- Water is pumped into one side of the bag and seeps through the top, bottom, and sides of the bag.
- Place filter bag on pavement or a gravel bed or paved surface. Avoid placing a dewatering bag on unprotected bare soil. If placing the bag on bare soil is unavoidable, a secondary barrier should be used, such as a rock filter bed placed beneath and beyond the edges of the bag to, prevent erosion and capture sediments that escape the bag.
- Perimeter control around the downstream end of the bag should be implemented. Secondary sediment controls are important especially in the initial stages of discharge, which tend to allow fines to pass through the bag.

Maintenance:

- Inspection of the flow conditions, bag condition, bag capacity, and the secondary barrier (as applicable) is required.
- Replace the bag when it no longer filters sediment or passes water at a reasonable rate.
- Caution should be taken when removing and disposing of the bag, to prevent the release of captured sediment
- Properly dispose of the bag offsite. If sediment is removed from the bag prior to disposal (bags can potentially be reused depending upon their condition), dispose of sediment in accordance with the general maintenance procedures described at the end of this BMP Fact Sheet.

Sand Media Particulate Filter

Description:

- Water is treated by passing it through canisters filled with sand media. Generally, sand filters provide a final level of treatment. They are often used as a secondary or higher level of treatment after a significant amount of sediment and other pollutants have been removed using other methods.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, and silt and some metals, as well as the reduction of biochemical oxygen demand (BOD) and turbidity.
- Sand filters can be used for stand-alone treatment or in conjunction with bag and cartridge filtration if further treatment is required.
- Sand filters can also be used to provide additional treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filters require regular service to monitor and maintain the level of the sand media. If subjected to high loading rates, filters can plug quickly.
- Venders generally provide data on maximum head loss through the filter. The filter should be monitored daily while in use and cleaned when head loss reaches target levels.
- If cleaned by backwashing, the backwash water may need to be hauled away for disposal or returned to the upper end of the treatment train for another pass through the series of dewatering BMPs.

Pressurized Bag Filter

Description:

- A pressurized bag filter is a unit composed of single filter bags made from polyester felt material. The water filters through the unit and is discharged through a header. Vendors provide bag filters in a variety of configurations. Some units include a combination of bag filters and cartridge filters for enhanced contaminant removal.

Appropriate Applications:

- Effective for the removal of sediment (sand and silt) and some metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Oil absorbent bags are available for hydrocarbon removal.

- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filter bags require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Cartridge Filter

Description:

- Cartridge filters provide a high degree of pollutant removal by utilizing a number of individual cartridges as part of a larger filtering unit. They are often used as a secondary or higher (polishing) level of treatment after a significant amount of sediment and other pollutants are removed. Units come with various cartridge configurations (for use in series with bag filters) or with a larger single cartridge filtration unit (with multiple filters within).

Appropriate Applications:

- Effective for the removal of sediment (sand, silt, and some clays) and metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Hydrocarbons can effectively be removed with special resin cartridges.

- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance.

Maintenance:

- The cartridges require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Costs

- Sediment control costs vary considerably depending on the dewatering and sediment treatment system that is selected. Pressurized filters tend to be more expensive than gravity settling but are often more effective. Simple tanks are generally rented on a long-term basis (one or more months) and can range from $460 per month for a 1,000-gallon tank to $3,400 per month for a 10,000-gallon tank (adjusted for inflation, 2016 dollars, by Tetra Tech Inc.). Mobilization and demobilization costs vary considerably.

Inspection and Maintenance

- Inspect and verify that dewatering BMPs are in place and functioning prior to the commencement of activities requiring dewatering.

- Inspect dewatering BMPs daily while dewatering activities are being conducted.

- Inspect all equipment before use. Monitor dewatering operations to ensure they do not cause offsite discharge or erosion.
- Sample dewatering discharges as required by the General Permit.
- Unit-specific maintenance requirements are included with the description of each unit.
- Sediment removed during the maintenance of a dewatering device may be either spread onsite and stabilized or disposed of at a disposal site as approved by the owner.
- Sediment that is commingled with other pollutants should be disposed of in accordance with all applicable laws and regulations and as approved by the owner.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

  Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

Implementation

General

- Avoid paving during the wet season when feasible.
- Reschedule paving and grinding activities if rain is forecasted.
- Train employees and sub-contractors in pollution prevention and reduction.
- Store materials away from drainage courses to prevent stormwater runon (see WM-1, Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or to trap and filter sediment.
- Stockpile material removed from roadways away from drain inlets, drainage ditches, and watercourses. These materials should be stored consistent with WM-3, Stockpile Management.
- Disposal of PCC (Portland cement concrete) and AC (asphalt concrete) waste should be in conformance with WM-8, Concrete Waste Management.

Saw Cutting, Grinding, and Pavement Removal

- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- When paving involves AC, the following steps should be implemented to prevent the discharge of grinding residue, uncompacted or loose AC, tack coats, equipment cleaners, or unrelated paving materials:
  - AC grindings, pieces, or chunks used in embankments or shoulder backing should not be allowed to enter any storm drains or watercourses. Install inlet protection and perimeter controls until area is stabilized (i.e. cutting, grinding or other removal activities are complete and loose material has been properly removed and disposed of)or permanent controls are in place. Examples of temporary perimeter controls can be found in EC-9, Earth Dikes and Drainage Swales; SE-1, Silt Fence; SE-5, Fiber Rolls, or SE-13 Compost Socks and Berms
  - Collect and remove all broken asphalt and recycle when practical. Old or spilled asphalt should be recycled or disposed of properly.
- Do not allow saw-cut slurry to enter storm drains or watercourses. Residue from grinding operations should be picked up by a vacuum attachment to the grinding machine, or by sweeping, should not be allowed to flow across the pavement, and should not be left on the surface of the pavement. See also WM-8, Concrete Waste Management, and WM-10, Liquid Waste Management.
- Pavement removal activities should not be conducted in the rain.
- Collect removed pavement material by mechanical or manual methods. This material may be recycled for use as shoulder backing or base material.

- If removed pavement material cannot be recycled, transport the material back to an approved storage site.

Asphaltic Concrete Paving

- If paving involves asphaltic cement concrete, follow these steps:

  - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks. Vacuum or sweep loose sand and gravel and properly dispose of this waste by referring to WM-5, Solid Waste Management.

  - Old asphalt should be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.

Portland Cement Concrete Paving

- Do not wash sweepings from exposed aggregate concrete into a storm drain system. Collect waste materials by dry methods, such as sweeping or shoveling, and return to aggregate base stockpile or dispose of properly. Allow aggregate rinse to settle. Then, either allow rinse water to dry in a temporary pit as described in WM-8, Concrete Waste Management, or pump the water to the sanitary sewer if authorized by the local wastewater authority.

Sealing Operations

- During chip seal application and sweeping operations, petroleum or petroleum covered aggregate should not be allowed to enter any storm drain or water courses. Apply temporary perimeter controls until structure is stabilized (i.e. all sealing operations are complete and cured and loose materials have been properly removed and disposed).

- Inlet protection (SE-10, Storm Drain Inlet Protection) should be used during application of seal coat, tack coat, slurry seal, and fog seal.

- Seal coat, tack coat, slurry seal, or fog seal should not be applied if rainfall is predicted to occur during the application or curing period.

Paving Equipment

- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials and dispose of in accordance with the applicable regulations. See NS-10, Vehicle and Equipment Maintenance, WM-4, Spill Prevention and Control, and WM-10, Liquid Waste Management.

- Substances used to coat asphalt transport trucks and asphalt spreading equipment should not contain soap and should be non-foaming and non-toxic.

- Paving equipment parked onsite should be parked over plastic to prevent soil contamination.

- Clean asphalt coated equipment offsite whenever possible. When cleaning dry, hardened asphalt from equipment, manage hardened asphalt debris as described in WM-5, Solid Waste Management. Any cleaning onsite should follow NS-8, Vehicle and Equipment Cleaning.

Thermoplastic Striping

- Thermoplastic striper and pre-heater equipment shutoff valves should be inspected to ensure that they are working properly to prevent leaking thermoplastic from entering drain inlets, the stormwater drainage system, or watercourses.
- Pre-heaters should be filled carefully to prevent splashing or spilling of hot thermoplastic. Leave six inches of space at the top of the pre-heater container when filling thermoplastic to allow room for material to move.
- Do not pre-heat, transfer, or load thermoplastic near drain inlets or watercourses.
- Clean truck beds daily of loose debris and melted thermoplastic. When possible, recycle thermoplastic material.

Raised/Recessed Pavement Marker Application and Removal

- Do not transfer or load bituminous material near drain inlets, the stormwater drainage system, or watercourses.
- Melting tanks should be loaded with care and not filled to beyond six inches from the top to leave room for splashing.
- When servicing or filling melting tanks, ensure all pressure is released before removing lids to avoid spills.
- On large-scale projects, use mechanical or manual methods to collect excess bituminous material from the roadway after removal of markers.

Costs

- All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of paving and grinding operations.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Sample stormwater runoff required by the General Permit.
- Keep ample supplies of drip pans or absorbent materials onsite.
- Inspect and maintain machinery regularly to minimize leaks and drips.

Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Procedures and practices designed for construction contractors to recognize illicit connections or illegally dumped or discharged materials on a construction site and report incidents.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Illicit connection/discharge and reporting is applicable anytime an illicit connection or discharge is discovered, or illegally dumped material is found on the construction site.

Limitations

Illicit connections and illegal discharges or dumping, for the purposes of this BMP, refer to discharges and dumping caused by parties other than the contractor. If pre-existing hazardous materials or wastes are known to exist onsite, they should be identified in the SWPPP and handled as set forth in the SWPPP.

Implementation

Planning

- Review the SWPPP. Pre-existing areas of contamination should be identified and documented in the SWPPP.
- Inspect site before beginning the job for evidence of illicit connections, illegal dumping or discharges. Document any pre-existing conditions and notify the owner.

- Inspect site regularly during project execution for evidence of illicit connections, illegal dumping or discharges.
- Observe site perimeter for evidence for potential of illicitly discharged or illegally dumped material, which may enter the job site.

Identification of Illicit Connections and Illegal Dumping or Discharges

- **General –** unlabeled and unidentifiable material should be treated as hazardous.
- **Solids** - Look for debris, or rubbish piles. Solid waste dumping often occurs on roadways with light traffic loads or in areas not easily visible from the traveled way.
- **Liquids** - signs of illegal liquid dumping or discharge can include:
  - Visible signs of staining or unusual colors to the pavement or surrounding adjacent soils
  - Pungent odors coming from the drainage systems
  - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
  - Abnormal water flow during the dry weather season
- **Urban Areas** - Evidence of illicit connections or illegal discharges is typically detected at storm drain outfall locations or at manholes. Signs of an illicit connection or illegal discharge can include:
  - Abnormal water flow during the dry weather season
  - Unusual flows in sub drain systems used for dewatering
  - Pungent odors coming from the drainage systems
  - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
  - Excessive sediment deposits, particularly adjacent to or near active offsite construction projects
- **Rural Areas** - Illicit connections or illegal discharges involving irrigation drainage ditches are detected by visual inspections. Signs of an illicit discharge can include:
  - Abnormal water flow during the non-irrigation season
  - Non-standard junction structures
  - Broken concrete or other disturbances at or near junction structures

Reporting

Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery. For illicit connections or discharges to the storm drain system, notify the local stormwater management agency. For illegal dumping, notify the local law enforcement agency.

Cleanup and Removal

The responsibility for cleanup and removal of illicit or illegal dumping or discharges will vary by location. Contact the local stormwater management agency for further information.

Costs

Costs to look for and report illicit connections and illegal discharges and dumping are low. The best way to avoid costs associated with illicit connections and illegal discharges and dumping is to keep the project perimeters secure to prevent access to the site, to observe the site for vehicles that should not be there, and to document any waste or hazardous materials that exist onsite before taking possession of the site.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect the site regularly to check for any illegal dumping or discharge.
- Prohibit employees and subcontractors from disposing of non-job-related debris or materials at the construction site.
- Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery.

Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

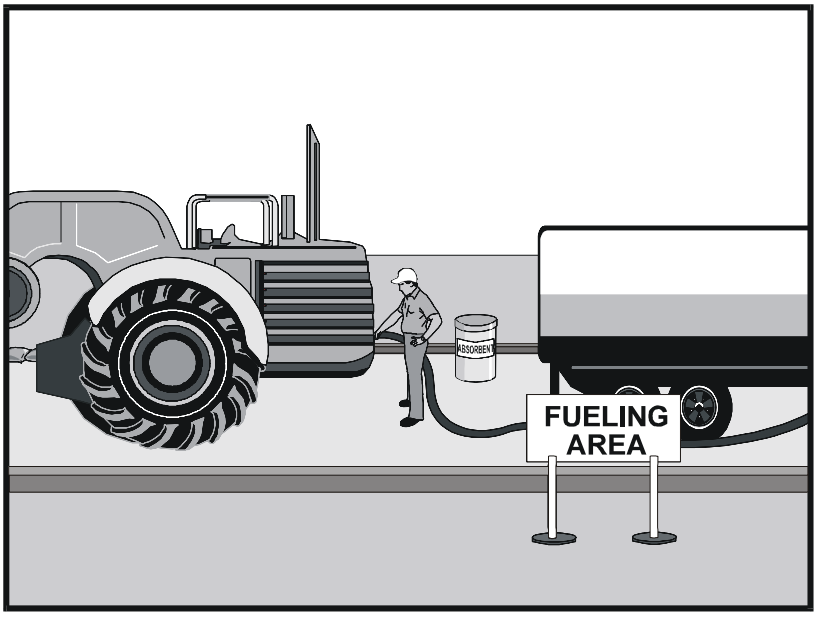
CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning onsite. Steam cleaning can generate significant pollutant concentrates.
- Cleaning of vehicles and equipment with soap, solvents or steam should not occur on the project site unless resulting wastes are fully contained and disposed of. Resulting wastes should not be discharged or buried and must be captured and recycled or disposed according to the requirements of WM-10, Liquid Waste Management or WM-6, Hazardous Waste Management, depending on the waste characteristics. Minimize use of solvents. Use of diesel for vehicle and equipment cleaning is prohibited.
- All vehicles and equipment that regularly enter and leave the construction site must be cleaned offsite.
- When vehicle and equipment washing and cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area should have the following characteristics:
  - Located away from storm drain inlets, drainage facilities, or watercourses
  - Paved with concrete or asphalt and bermed to contain wash waters and to prevent runon and runoff
  - Configured with a sump to allow collection and disposal of wash water
  - No discharge of wash waters to storm drains or watercourses
  - Used only when necessary
- When cleaning vehicles and equipment with water:
  - Use as little water as possible. High-pressure sprayers may use less water than a hose and should be considered
  - Use positive shutoff valve to minimize water usage
  - Facility wash racks should discharge to a sanitary sewer, recycle system or other approved discharge system and must not discharge to the storm drainage system, watercourses, or to groundwater

Costs

Cleaning vehicles and equipment at an offsite facility may reduce overall costs for vehicle and equipment cleaning by eliminating the need to provide similar services onsite. When onsite cleaning is needed, the cost to establish appropriate facilities is relatively low on larger, long-duration projects, and moderate to high on small, short-duration projects.

Inspection and Maintenance



- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspection and maintenance is minimal, although some berm repair may be necessary.
- Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.
- Inspect sump regularly and remove liquids and sediment as needed.
- Prohibit employees and subcontractors from washing personal vehicles and equipment on the construction site.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Vehicle equipment fueling procedures and practices are designed to prevent fuel spills and leaks and reduce or eliminate contamination of stormwater. This can be accomplished by using offsite facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors in proper fueling procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment fueling takes place.

Limitations

Onsite vehicle and equipment fueling should only be used where it is impractical to send vehicles and equipment offsite for fueling. Sending vehicles and equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/ Exit.

Implementation

- Use offsite fueling stations as much as possible. These businesses are better equipped to handle fuel and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate fueling area at a site.
- Discourage "topping-off" of fuel tanks.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Absorbent spill cleanup materials and spill kits should be available in fueling areas and on fueling trucks and should be disposed of properly after use.
- Drip pans or absorbent pads should be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Use absorbent materials on small spills. Do not hose down or bury the spill. Remove the adsorbent materials promptly and dispose of properly.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and large excavators, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- When fueling must take place onsite, designate an area away from drainage courses to be used. Fueling areas should be identified in the SWPPP.
- Dedicated fueling areas should be protected from stormwater runon and runoff and should be located at least 50 ft away from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Protect fueling areas with berms and dikes to prevent runon, runoff, and to contain spills.
- Nozzles used in vehicle and equipment fueling should be equipped with an automatic shutoff to control drips. Fueling operations should not be left unattended.
- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD).
- Federal, state, and local requirements should be observed for any stationary above ground storage tanks.

Costs

- All of the above measures are low cost except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Vehicles and equipment should be inspected each day of use for leaks. Leaks should be repaired immediately, or problem vehicles or equipment should be removed from the project site.
- Keep ample supplies of spill cleanup materials onsite.

- Immediately clean up spills and properly dispose of contaminated soil and cleanup materials.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the contamination of stormwater resulting from vehicle and equipment maintenance by running a "dry and clean site". The best option would be to perform maintenance activities at an offsite facility. If this option is not available then work should be performed in designated areas only, while providing cover for materials stored outside, checking for leaks and spills, and containing and cleaning up spills immediately. Employees and subcontractors must be trained in proper procedures.

Suitable Applications

These procedures are suitable on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

Onsite vehicle and equipment maintenance should only be used where it is impractical to send vehicles and equipment offsite for maintenance and repair. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Outdoor vehicle or equipment maintenance is a potentially significant source of stormwater pollution. Activities that can contaminate stormwater include engine repair and service, changing or replacement of fluids, and outdoor equipment storage and parking (engine fluid leaks). For further information on vehicle or equipment servicing, see NS-8,

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Vehicle and Equipment Cleaning, and NS-9, Vehicle and Equipment Fueling.

Implementation

- Use offsite repair shops as much as possible. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur onsite, use designated areas, located away from drainage courses. Dedicated maintenance areas should be protected from stormwater runon and runoff and should be located at least 50 ft from downstream drainage facilities and watercourses.
- Drip pans or absorbent pads should be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- All fueling trucks and fueling areas are required to have spill kits and/or use other spill protection devices.
- Use adsorbent materials on small spills. Remove the absorbent materials promptly and dispose of properly.
- Inspect onsite vehicles and equipment daily at startup for leaks, and repair immediately.
- Keep vehicles and equipment clean; do not allow excessive build-up of oil and grease.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic and transmission fluids. Provide secondary containment and covers for these materials if stored onsite.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- Drip pans or plastic sheeting should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- For long-term projects, consider using portable tents or covers over maintenance areas if maintenance cannot be performed offsite.
- Consider use of new, alternative greases and lubricants, such as adhesive greases, for chassis lubrication and fifth-wheel lubrication.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose of or recycle used batteries.
- Do not bury used tires.

- Repair leaks of fluids and oil immediately.

Listed below is further information if you must perform vehicle or equipment maintenance onsite.

Safer Alternative Products

- Consider products that are less toxic or hazardous than regular products. These products are often sold under an "environmentally friendly" label.
- Consider use of grease substitutes for lubrication of truck fifth-wheels. Follow manufacturers label for details on specific uses.
- Consider use of plastic friction plates on truck fifth-wheels in lieu of grease. Follow manufacturers label for details on specific uses.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, trichloroethane, or methylene chloride. Many of these cleaners are listed in California Toxic Rule as priority pollutants. These materials are harmful and must not contaminate stormwater. They must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check the list of active ingredients to see whether it contains chlorinated solvents. The "chlor" term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling and Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous wastes separate, do not mix used oil solvents, and keep chlorinated solvents (like,-trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around. Provide cover and secondary containment until these materials can be removed from the site.

Oil filters can be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Costs

All of the above are low cost measures. Higher costs are incurred to setup and maintain onsite maintenance areas.

Vehicle & Equipment Maintenance NS-10

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Keep ample supplies of spill cleanup materials onsite.
- Maintain waste fluid containers in leak proof condition.
- Vehicles and equipment should be inspected on each day of use. Leaks should be repaired immediately, or the problem vehicle(s) or equipment should be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

Pile Driving Operations NS-11

Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	

Legend:
☑ **Primary Objective**
☒ **Secondary Objective**

Targeted Constituents	
Sediment	☑
Nutrients	
Trash	
Metals	
Bacteria	
Oil and Grease	☑
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of precast concrete, steel, or timber. Driven sheet piles are also used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce or eliminate the discharge of potential pollutants to the storm drain system, watercourses, and waters of the United States.

Suitable Applications

These procedures apply to all construction sites near or adjacent to a watercourse or groundwater where permanent and temporary pile driving (impact and vibratory) takes place, including operations using pile shells as well as construction of cast-in-steel-shell and cast-in-drilled-hole piles.

Limitations

None identified.

Implementation

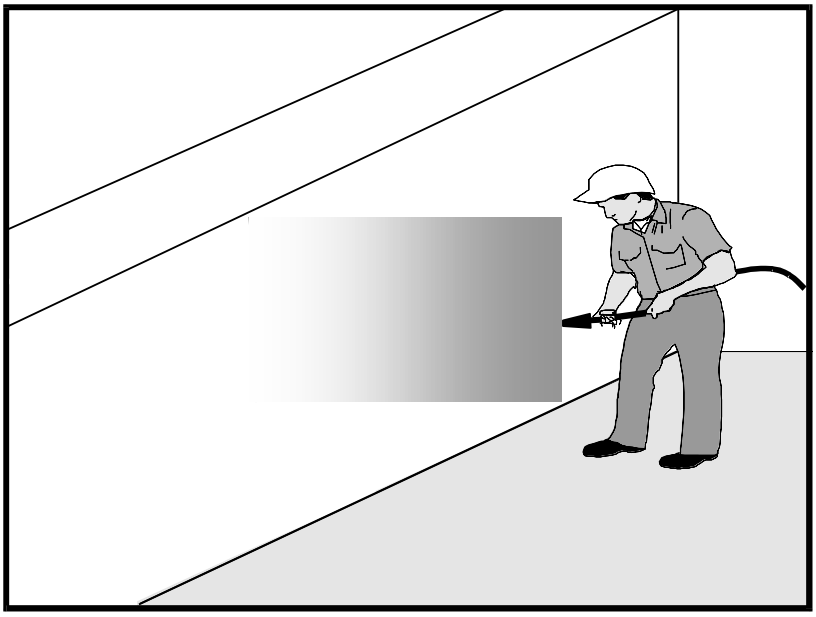
- Use drip pans or absorbent pads during vehicle and equipment operation, maintenance, cleaning, fueling, and storage. Refer to NS-8, Vehicle and Equipment Cleaning, NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.

- Have spill kits and cleanup materials available at all locations of pile driving. Refer to WM-4, Spill Prevention and Control.
- Equipment that is stored or in use in streambeds, or on docks, barges, or other structures over water bodies should be kept leak free.
- Park equipment over plastic sheeting or equivalent where possible. Plastic is not a substitute for drip pans or absorbent pads. The storage or use of equipment in streambeds or other bodies of water must comply with all applicable permits.
- Implement other BMPs as applicable, such as NS-2, Dewatering Operations, WM-5, Solid Waste Management, WM-6, Hazardous Waste Management, and WM-10, Liquid Waste Management.
- When not in use, store pile-driving equipment away from concentrated flows of stormwater, drainage courses, and inlets. Protect hammers and other hydraulic attachments from runon and runoff by placing them on plywood and covering them with plastic or a comparable material prior to the onset of rain.
- Use less hazardous products, e.g., vegetable oil, when practicable.

Costs

All of the above measures can be low cost.

Inspection and Maintenance



- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspect equipment every day at startup and repair equipment as needed (i.e., worn or damaged hoses, fittings, and gaskets). Recheck equipment at shift changes or at the end of the day and scheduled repairs as needed.

Concrete Curing NS-12

Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Targeted Constituents	
Sediment	☑
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.

Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

Chemical Curing

- Avoid over spray of curing compounds.
- Minimize the drift by applying the curing compound close to the concrete surface. Apply an amount of compound that covers the surface but does not allow any runoff of the compound.
- Use proper storage and handling techniques for concrete curing compounds. Refer to WM-1, Material Delivery and Storage.
- Protect drain inlets prior to the application of curing compounds.
- Refer to WM-4, Spill Prevention and Control.

Water Curing for Bridge Decks, Retaining Walls, and other Structures

- Direct cure water away from inlets and watercourses to collection areas for evaporation or other means of removal in accordance with all applicable permits. See WM-8 Concrete Waste Management.
- Collect cure water at the top of slopes and transport to a concrete waste management area in a non-erosive manner. See EC-9 Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Utilize wet blankets or a similar method that maintains moisture while minimizing the use and possible discharge of water.

Education

- Educate employees, subcontractors, and suppliers on proper concrete curing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete curing procedures.

Costs

All of the above measures are generally low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts uncured and partially cured concrete as required by the General Permit.

- Ensure that employees and subcontractors implement appropriate measures for storage, handling, and use of curing compounds.
- Inspect cure containers and spraying equipment for leaks.

Concrete Finishing NS-13

Categories

EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	☑

Legend:

☑ **Primary Category**

☒ **Secondary Category**

Targeted Constituents

Sediment	☑
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high-pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

- Collect and properly dispose of water from high-pressure water blasting operations.
- Collect contaminated water from blasting operations at the top of slopes. Transport or dispose of contaminated water while using BMPs such as those for erosion control. Refer to EC-9, Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Direct water from blasting operations away from inlets and watercourses to collection areas for infiltration or other means of removal (dewatering). Refer to NS-2 Dewatering Operations.
- Protect inlets during sandblasting operations. Refer to SE-10, Storm Drain Inlet Protection.
- Refer to WM-8, Concrete Waste Management for disposal of concrete debris.
- Minimize the drift of dust and blast material as much as possible by keeping the blasting nozzle close to the surface.
- When blast residue contains a potentially hazardous waste, refer to WM-6, Hazardous Waste Management.

Education

- Educate employees, subcontractors, and suppliers on proper concrete finishing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete finishing procedures.

Costs

These measures are generally of low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts concrete dust and debris as required by the General Permit.

- Sweep or vacuum up debris from sandblasting at the end of each shift.
- At the end of each work shift, remove and contain liquid and solid waste from containment structures, if any, and from the general work area.
- Inspect containment structures for damage prior to use and prior to onset of forecasted rain.

Material Delivery and Storage WM-1

Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

Targeted Constituents	
Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Asphalt and concrete components
- Hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Concrete compounds
- Other materials that may be detrimental if released to the environment

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds often must meet building and fire code requirements.

Implementation

The following steps should be taken to minimize risk:

- Chemicals must be stored in water tight containers with appropriate secondary containment or in a storage shed.
- When a material storage area is located on bare soil, the area should be lined and bermed.
- Use containment pallets or other practical and available solutions, such as storing materials within newly constructed buildings or garages, to meet material storage requirements.
- Stack erodible landscape material on pallets and cover when not in use.
- Contain all fertilizers and other landscape materials when not in use.
- Temporary storage areas should be located away from vehicular traffic.
- Material Safety Data Sheets (MSDS) should be available on-site for all materials stored that have the potential to effect water quality.
- Construction site areas should be designated for material delivery and storage.
- Material delivery and storage areas should be located away from waterways, if possible.
    - Avoid transport near drainage paths or waterways.
    - Surround with earth berms or other appropriate containment BMP. See EC-9, Earth Dikes and Drainage Swales.
    - Place in an area that will be paved.
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- An up to date inventory of materials delivered and stored onsite should be kept.

- Hazardous materials storage onsite should be minimized.
- Hazardous materials should be handled as infrequently as possible.
- Keep ample spill cleanup supplies appropriate for the materials being stored. Ensure that cleanup supplies are in a conspicuous, labeled area.
- Employees and subcontractors should be trained on the proper material delivery and storage practices.
- Employees trained in emergency spill cleanup procedures must be present when dangerous materials or liquid chemicals are unloaded.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose of materials and any contaminated soil. See WM-7, Contaminated Soil Management. If the area is to be paved, pave as soon as materials are removed to stabilize the soil.

Material Storage Areas and Practices

- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 should be stored in approved containers and drums and should not be overfilled. Containers and drums should be placed in temporary containment facilities for storage.
- A temporary containment facility should provide for a spill containment volume able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility should be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be collected and placed into drums. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids should be sent to an approved disposal site.
- Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Materials should be covered prior to, and during rain events.
- Materials should be stored in their original containers and the original product labels should be maintained in place in a legible condition. Damaged or otherwise illegible labels should be replaced immediately.

- Bagged and boxed materials should be stored on pallets and should not be allowed to accumulate on the ground. To provide protection from wind and rain throughout the rainy season, bagged and boxed materials should be covered during non-working days and prior to and during rain events.
- Stockpiles should be protected in accordance with WM-3, Stockpile Management.
- Materials should be stored indoors within existing structures or completely enclosed storage sheds when available.
- Proper storage instructions should be posted at all times in an open and conspicuous location.
- An ample supply of appropriate spill clean up material should be kept near storage areas.
- Also see WM-6, Hazardous Waste Management, for storing of hazardous wastes.

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored onsite.
- Arrange for employees trained in emergency spill cleanup procedures to be present when dangerous materials or liquid chemicals are unloaded.

Spill Cleanup

- Contain and clean up any spill immediately.
- Properly remove and dispose of any hazardous materials or contaminated soil if significant residual materials remain on the ground after construction is complete. See WM-7, Contaminated Soil Management.
- See WM-4, Spill Prevention and Control, for spills of chemicals and/or hazardous materials.
- If spills or leaks of materials occur that are not contained and could discharge to surface waters, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Cost

- The largest cost of implementation may be in the construction of a materials storage area that is covered and provides secondary containment.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep storage areas clean and well organized, including a current list of all materials onsite.
- Inspect labels on containers for legibility and accuracy.

- Repair or replace perimeter controls, containment structures, covers, and liners as needed to maintain proper function.

Material Use WM-2

Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Legend:

☑ **Primary Category**

☒ **Secondary Category**

Targeted Constituents

Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

Safer alternative building and construction products may not be available or suitable in every instance.

Implementation

The following steps should be taken to minimize risk:

- Minimize use of hazardous materials onsite.
- Follow manufacturer instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Train personnel who use pesticides. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct onsite inspections.
- The preferred method of termiticide application is soil injection near the existing or proposed structure foundation/slab; however, if not feasible, soil drench application of termiticides should follow EPA label guidelines and the following recommendations (most of which are applicable to most pesticide applications):
  - Do not treat soil that is water-saturated or frozen.
  - Application shall not commence within 24-hours of a predicted precipitation event with a 40% or greater probability. Weather tracking must be performed on a daily basis prior to termiticide application and during the period of termiticide application.
  - Do not allow treatment chemicals to runoff from the target area. Apply proper quantity to prevent excess runoff. Provide containment for and divert stormwater from application areas using berms or diversion ditches during application.
  - Dry season: Do not apply within 10 feet of storm drains. Do not apply within 25 feet of aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds).
  - Wet season: Do not apply within 50 feet of storm drains or aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds) unless a vegetative buffer is present (if so, refer to dry season requirements).
  - Do not make on-grade applications when sustained wind speeds are above 10 mph (at application site) at nozzle end height.
  - Cover treatment site prior to a rain event in order to prevent run-off of the pesticide into non-target areas. The treated area should be limited to a size that can be backfilled and/or covered by the end of the work shift. Backfilling or covering of the treated area shall be done by the end of the same work shift in which the application is made.
  - The applicator must either cover the soil him/herself or provide written notification of the above requirement to the contractor on site and to the person commissioning the

application (if different than the contractor). If notice is provided to the contractor or the person commissioning the application, then they are responsible under the Federal Insecticide Fungicide, and Rodenticide Act (FIFRA) to ensure that: 1) if the concrete slab cannot be poured over the treated soil within 24 hours of application, the treated soil is covered with a waterproof covering (such as polyethylene sheeting), and 2) the treated soil is covered if precipitation is predicted to occur before the concrete slab is scheduled to be poured.

- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydraulic application. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried offsite by runoff. Do not apply these chemicals before predicted rainfall.
- Train employees and subcontractors in proper material use.
- Supply Material Safety Data Sheets (MSDS) for all materials.
- Dispose of latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths, when thoroughly dry and are no longer hazardous, with other construction debris.
- Do not remove the original product label; it contains important safety and disposal information. Use the entire product before disposing of the container.
- Mix paint indoors or in a containment area. Never clean paintbrushes or rinse paint containers into a street, gutter, storm drain, or watercourse. Dispose of any paint thinners, residue, and sludge(s) that cannot be recycled, as hazardous waste.
- For water-based paint, clean brushes to the extent practicable, and rinse to a drain leading to a sanitary sewer where permitted or contain for proper disposal off site. For oil-based paints, clean brushes to the extent practicable, and filter and reuse thinners and solvents.
- Use recycled and less hazardous products when practical. Recycle residual paints, solvents, non-treated lumber, and other materials.
- Use materials only where and when needed to complete the construction activity. Use safer alternative materials as much as possible. Reduce or eliminate use of hazardous materials onsite when practical.
- Document the location, time, chemicals applied, and applicator's name and qualifications.
- Keep an ample supply of spill clean up material near use areas. Train employees in spill clean up procedures.
- Avoid exposing applied materials to rainfall and runoff unless sufficient time has been allowed for them to dry.
- Discontinue use of erodible landscape material within 2 days prior to a forecasted rain event and materials should be covered and/or bermed.

- Provide containment for material use areas such as masons' areas or paint mixing/preparation areas to prevent materials/pollutants from entering stormwater.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Ensure employees and subcontractors throughout the job are using appropriate practices.

Stockpile Management WM-3

Treat Categories		
EC	Erosion Control	
SE	Sediment Control	☒
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☒
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as Portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called "cold mix" asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Targeted Constituents	
Sediment	☑
Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- On larger sites, a minimum of 50 ft separation from concentrated flows of stormwater, drainage courses, and inlets is recommended.
- After 14 days of inactivity, a stockpile is non-active and requires further protection described below. All stockpiles are required to be protected as non-active stockpiles immediately if they are not scheduled to be used within 14 days.
- Protect all stockpiles from stormwater run-on using temporary perimeter sediment barriers such as compost berms (SE-13), temporary silt dikes (SE-12), fiber rolls (SE-5), silt fences (SE-1), sandbags (SE-8), gravel bags (SE-6), or biofilter bags (SE-14). Refer to the individual fact sheet for each of these controls for installation information.
- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information, see WE-1, Wind Erosion Control.
- Manage stockpiles of contaminated soil in accordance with WM-7, Contaminated Soil Management.
- Place bagged materials on pallets and under cover.
- Ensure that stockpile coverings are installed securely to protect from wind and rain.
- Some plastic covers withstand weather and sunlight better than others. Select cover materials or methods based on anticipated duration of use.

Protection of Non-Active Stockpiles

A stockpile is considered non-active if it either is not used for 14 days or if it is scheduled not to be used for 14 days or more. Stockpiles need to be protected immediately if they are not scheduled to be used within 14 days. Non-active stockpiles of the identified materials should be protected as follows:

Soil stockpiles

- Soil stockpiles should be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times.
- Temporary vegetation should be considered for topsoil piles that will be stockpiled for extended periods.

Stockpiles of Portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate sub base

- Stockpiles should be covered and protected with a temporary perimeter sediment barrier at all times.

Stockpiles of "cold mix"

- Cold mix stockpiles should be placed on and covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Stockpiles of fly ash, stucco, hydrated lime

- Stockpiles of materials that may raise the pH of runoff (i.e., basic materials) should be covered with plastic and surrounded by a berm.

Stockpiles/Storage of treated wood

- Treated wood should be covered with plastic sheeting or comparable material at all times and surrounded by a berm.

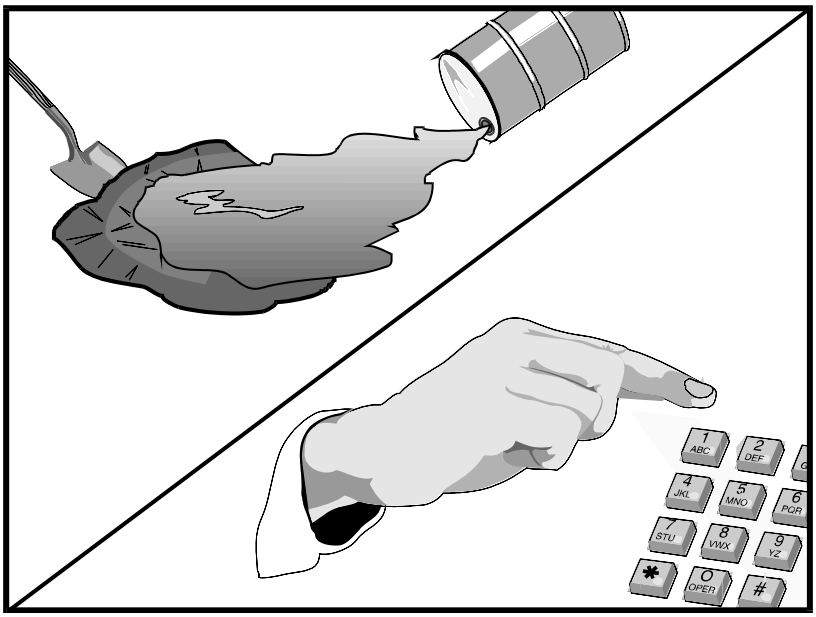
Protection of Active Stockpiles

A stockpile is active when it is being used or is scheduled to be used within 14 days of the previous use. Active stockpiles of the identified materials should be protected as follows:

- All stockpiles should be covered and protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of "cold mix" and treated wood, and basic materials should be placed on and covered with plastic sheeting or comparable material and surrounded by a berm prior to the onset of precipitation.
- The downstream perimeter of an active stockpile should be protected with a linear sediment barrier or berm and runoff should be diverted around or away from the stockpile on the upstream perimeter.

Costs

For cost information associated with stockpile protection refer to the individual erosion or sediment control BMP fact sheet considered for implementation (For example, refer to SE-1 Silt Fence for installation of silt fence around the perimeter of a stockpile.)



Inspection and Maintenance

- Stockpiles must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- It may be necessary to inspect stockpiles covered with plastic sheeting more frequently during certain conditions (for example, high winds or extreme heat).
- Repair and/or replace perimeter controls and covers as needed to keep them functioning properly.
- Sediment shall be removed when it reaches one-third of the barrier height.

Spill Prevention and Control WM-4

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Fuels
- Lubricants
- Other petroleum distillates

Limitations

- In some cases, it may be necessary to use a private spill cleanup company.
- This BMP applies to spills caused by the contractor and subcontractors.
- Procedures and practices presented in this BMP are general. Contractor should identify appropriate practices for the specific materials used or stored onsite

Implementation

The following steps will help reduce the stormwater impacts of leaks and spills:

Education

- Be aware that different materials pollute in different amounts. Make sure that each employee knows what a "significant spill" is for each material they use, and what is the appropriate response for "significant" and "insignificant" spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- Have contractor's superintendent or representative oversee and enforce proper spill prevention and control measures.

General Measures

- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
- Store hazardous materials and wastes in covered containers and protect from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals to oversee and enforce control measures.
- Spills should be covered and protected from stormwater runon during rainfall to the extent that it doesn't compromise clean up activities.
- Do not bury or wash spills with water.

- Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMPs.
- Do not allow water used for cleaning and decontamination to enter storm drains or watercourses. Collect and dispose of contaminated water in accordance with WM-10, Liquid Waste Management.
- Contain water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.
- Place proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.
- Keep waste storage areas clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

- Clean up leaks and spills immediately.
- Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this section for specific information.

Minor Spills

- Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.
- Use absorbent materials on small spills rather than hosing down or burying the spill.
- Absorbent materials should be promptly removed and disposed of properly.
- Follow the practice below for a minor spill:
  - Contain the spread of the spill.
  - Recover spilled materials.
  - Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills

- Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.

- Spills should be cleaned up immediately:
  - Contain spread of the spill.
  - Notify the project foreman immediately.
  - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
  - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
  - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps should be taken:
  - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
  - Notify the Governor's Office of Emergency Services Warning Center, (916) 845-8911.
  - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
  - Notification should first be made by telephone and followed up with a written report.
  - The services of a spill's contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
  - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, etc.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hours).

Use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Regularly inspect onsite vehicles and equipment for leaks and repair immediately
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around
- Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask the oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur onsite, use designate areas, located away from drainage courses, to prevent the runon of stormwater and the runoff of spills.
- Discourage "topping off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/ leaks.

Costs

Prevention of leaks and spills is inexpensive. Treatment and/ or disposal of contaminated soil or water can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Keep ample supplies of spill control and cleanup materials onsite, near storage, unloading, and maintenance areas.
- Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals onsite.

Nutrients	☑
Trash	☑
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Highway planting wastes, including vegetative material, plant containers, and packaging materials

Limitations

Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

Implementation

The following steps will help keep a clean site and reduce stormwater pollution:

- Select designated waste collection areas onsite.
- Inform trash-hauling contractors that you will accept only watertight dumpsters for onsite use. Inspect dumpsters for leaks and repair any dumpster that is not watertight.
- Locate containers in a covered area or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it is windy.
- Cover waste containers at the end of each work day and when it is raining.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Remove this solid waste promptly since erosion and sediment control devices tend to collect litter.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to the trash hauling contractor.
- Arrange for regular waste collection before containers overflow.
- Clean up immediately if a container does spill.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.

Education

- Have the contractor's superintendent or representative oversee and enforce proper solid waste management procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.

- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Minimize production of solid waste materials wherever possible.

Collection, Storage, and Disposal

- Littering on the project site should be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines should be a priority.
- Trash receptacles should be provided in the contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Litter from work areas within the construction limits of the project site should be collected and placed in watertight dumpsters at least weekly, regardless of whether the litter was generated by the contractor, the public, or others. Collected litter and debris should not be placed in or next to drain inlets, stormwater drainage systems, or watercourses.
- Dumpsters of sufficient size and number should be provided to contain the solid waste generated by the project.
- Full dumpsters should be removed from the project site and the contents should be disposed of by the trash hauling contractor.
- Construction debris and waste should be removed from the site biweekly or more frequently as needed.
- Construction material visible to the public should be stored or stacked in an orderly manner.
- Stormwater runon should be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas should be located at least 50 ft from drainage facilities and watercourses and should not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters should be securely covered from wind and rain by covering the waste with tarps or plastic.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management. Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
- Salvage or recycle useful vegetation debris, packaging and surplus building materials when practical. For example, trees and shrubs from land clearing can be used as a brush barrier, or converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Inspect construction waste area regularly.
- Arrange for regular waste collection.

Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Hazardous waste management practices are implemented on construction projects that generate waste from the use of:

- Petroleum Products
- Asphalt Products
- Concrete Curing Compounds
- Pesticides
- Palliatives
- Acids
- Septic Wastes
- Paints
- Stains
- Solvents
- Wood Preservatives
- Roofing Tar
- Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302

In addition, sites with existing structures may contain wastes, which must be disposed of in accordance with federal, state, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints
- Asbestos
- PCBs (particularly in older transformers)

Limitations

- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Nothing in this BMP relieves the contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
- This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to WM-7, Contaminated Soil Management.

Implementation

The following steps will help reduce stormwater pollution from hazardous wastes:

Material Use

- Wastes should be stored in sealed containers constructed of a suitable material and should be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172, 173, 178, and 179.
- All hazardous waste should be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.
- Waste containers should be stored in temporary containment facilities that should comply with the following requirements:
    - Temporary containment facility should provide for a spill containment volume equal to 1.5 times the volume of all containers able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest tank within its boundary, whichever is greater.
    - Temporary containment facility should be impervious to the materials stored there for a minimum contact time of 72 hours.
    - Temporary containment facilities should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be placed into drums after each rainfall. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids should be sent to an approved disposal site.
    - Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.

  - Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.

  - Throughout the rainy season, temporary containment facilities should be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs.

- Drums should not be overfilled, and wastes should not be mixed.

- Unless watertight, containers of dry waste should be stored on pallets.

- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application. Allow time for infiltration and avoid excess material being carried offsite by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with federal and state regulations.

- Paint brushes and equipment for water and oil-based paints should be cleaned within a contained area and should not be allowed to contaminate site soils, watercourses, or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused should be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths should be disposed of as solid waste.

- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. “Paint out” brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and reuse thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.

- The following actions should be taken with respect to temporary contaminant:

  - Ensure that adequate hazardous waste storage volume is available.

  - Ensure that hazardous waste collection containers are conveniently located.

  - Designate hazardous waste storage areas onsite away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.

  - Minimize production or generation of hazardous materials and hazardous waste on the job site.

  - Use containment berms in fueling and maintenance areas and where the potential for spills is high.

  - Segregate potentially hazardous waste from non-hazardous construction site debris.

  - Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.

- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.
- Use all of the product before disposing of the container.
- Do not remove the original product label; it contains important safety and disposal information.

Waste Recycling Disposal

- Select designated hazardous waste collection areas onsite.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, making recycling impossible and complicating disposal.
- Recycle any useful materials such as used oil or water-based paint.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste (e.g., excess oil-based paint and sludge) is collected, removed, and disposed of only at authorized disposal areas.

Disposal Procedures

- Waste should be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- A Department of Health Services certified laboratory should sample waste to determine the appropriate disposal facility.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings).
- The contractor's superintendent or representative should oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Hazardous waste should be regularly collected.
- A foreman or construction supervisor should monitor onsite hazardous waste storage and disposal procedures.
- Waste storage areas should be kept clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored.
- Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

- Hazardous spills should be cleaned up and reported in conformance with the applicable Material Safety Data Sheet (MSDS) and the instructions posted at the project site.
- The National Response Center, at (800) 424-8802, should be notified of spills of federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302. Also notify the Governors Office of Emergency Services Warning Center at (916) 845-8911.
- A copy of the hazardous waste manifests should be provided.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing Portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Mortar-mixing stations exist.
- Stucco mixing and spraying.
- See also NS-8, Vehicle and Equipment Cleaning.

Limitations

- Offsite washout of concrete wastes may not always be possible.
- Multiple washouts may be needed to assure adequate capacity and to allow for evaporation.

Implementation

The following steps will help reduce stormwater pollution from concrete wastes:

- Incorporate requirements for concrete waste management into material supplier and subcontractor agreements.
- Store dry and wet materials under cover, away from drainage areas. Refer to WM-1, Material Delivery and Storage for more information.
- Avoid mixing excess amounts of concrete.
- Perform washout of concrete trucks in designated areas only, where washout will not reach stormwater.
- Do not wash out concrete trucks into storm drains, open ditches, streets, streams or onto the ground. Trucks should always be washed out into designated facilities.
- Do not allow excess concrete to be dumped onsite, except in designated areas.
- For onsite washout:
  - On larger sites, it is recommended to locate washout areas at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste.
  - Washout wastes into the temporary washout where the concrete can set, be broken up, and then disposed properly.
  - Washouts shall be implemented in a manner that prevents leaching to underlying soils. Washout containers must be water tight and washouts on or in the ground must be lined with a suitable impervious liner, typically a plastic type material.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile or dispose in the trash.
- See typical concrete washout installation details at the end of this fact sheet.

Education

- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.

- Arrange for contractor's superintendent or representative to oversee and enforce concrete waste management procedures.
- Discuss the concrete management techniques described in this BMP (such as handling of concrete waste and washout) with the ready-mix concrete supplier before any deliveries are made.

Concrete Demolition Wastes

- Stockpile concrete demolition waste in accordance with BMP WM-3, Stockpile Management.
- Dispose of or recycle hardened concrete waste in accordance with applicable federal, state or local regulations.

Concrete Slurry Wastes

- PCC and AC waste should not be allowed to enter storm drains or watercourses.
- PCC and AC waste should be collected and disposed of or placed in a temporary concrete washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below).
- A foreman or construction supervisor should monitor onsite concrete working tasks, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Saw-cut concrete slurry should not be allowed to enter storm drains or watercourses. Residue from grinding operations should be picked up by means of a vacuum attachment to the grinding machine or by sweeping. Saw cutting residue should not be allowed to flow across the pavement and should not be left on the surface of the pavement. See also NS-3, Paving and Grinding Operations; and WM-10, Liquid Waste Management.
- Concrete slurry residue should be disposed in a temporary washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below) and allowed to dry. Dispose of dry slurry residue in accordance with WM-5, Solid Waste Management.

Onsite Temporary Concrete Washout Facility, Transit Truck Washout Procedures

- Temporary concrete washout facilities should be located a minimum of 50 ft from storm drain inlets, open drainage facilities, and watercourses. Each facility should be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign should be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities.
- Temporary concrete washout facilities should be constructed above grade or below grade at the option of the contractor. Temporary concrete washout facilities should be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.

- Temporary washout facilities should have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Temporary washout facilities should be lined to prevent discharge to the underlying ground or surrounding area.
- Washout of concrete trucks should be performed in designated areas only.
- Only concrete from mixer truck chutes should be washed into concrete wash out.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed of or recycled offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete should be broken up, removed, and disposed of per WM-5, Solid Waste Management. Dispose of or recycle hardened concrete on a regular basis.
- Temporary Concrete Washout Facility (Type Above Grade)
    - Temporary concrete washout facility (type above grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft; however, smaller sites or jobs may only need a smaller washout facility. With any washout, always maintain a sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations.
    - Materials used to construct the washout area should conform to the provisions detailed in their respective BMPs (e.g., SE-8 Sandbag Barrier).
    - Plastic lining material should be a minimum of 10 mil in polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.
    - Alternatively, portable removable containers can be used as above grade concrete washouts. Also called a “roll-off”; this concrete washout facility should be properly sealed to prevent leakage and should be removed from the site and replaced when the container reaches 75% capacity.
- Temporary Concrete Washout Facility (Type Below Grade)
    - Temporary concrete washout facilities (type below grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft. The quantity and volume should be sufficient to contain all liquid and concrete waste generated by washout operations.
    - Lath and flagging should be commercial type.
    - Plastic lining material should be a minimum of 10 mil polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.

- The base of a washout facility should be free of rock or debris that may damage a plastic liner.

Removal of Temporary Concrete Washout Facilities

- When temporary concrete washout facilities are no longer required for the work, the hardened concrete should be removed and properly disposed or recycled in accordance with federal, state or local regulations. Materials used to construct temporary concrete washout facilities should be removed from the site of the work and properly disposed or recycled in accordance with federal, state or local regulations.

- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities should be backfilled and repaired.

Costs

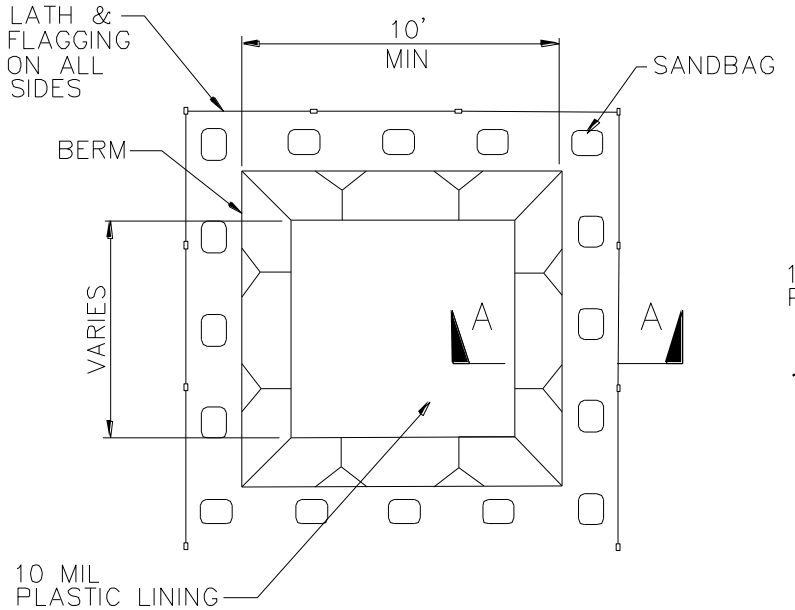
All of the above are low cost measures. Roll-off concrete washout facilities can be more costly than other measures due to removal and replacement; however, provide a cleaner alternative to traditional washouts. The type of washout facility, size, and availability of materials will determine the cost of the washout.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

- Temporary concrete washout facilities should be maintained to provide adequate holding capacity with a minimum freeboard of 4 in. for above grade facilities and 12 in. for below grade facilities. Maintaining temporary concrete washout facilities should include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials should be removed and properly disposed or recycled in accordance with federal, state or local regulations.

- Washout facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.



- Inspect washout facilities for damage (e.g. torn liner, evidence of leaks, signage, etc.). Repair all identified damage.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.

Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

- Temporary sanitary facilities must be equipped with containment to prevent discharge of pollutants to the stormwater drainage system of the receiving water.
- Consider safety as well as environmental implications before placing temporary sanitary facilities.
- Wastewater should not be discharged or buried within the project site.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, should comply with the local health agency, city, county, and sewer district requirements.
- Only reputable, licensed sanitary and septic waste haulers should be used.
- Sanitary facilities should be located in a convenient location.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an onsite disposal system (OSDS), such as a septic system, local health agency requirements must be followed.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- Sanitary and septic facilities should be maintained in good working order by a licensed service.
- Regular waste collection by a licensed hauler should be arranged before facilities overflow.
- If a spill does occur from a temporary sanitary facility, follow federal, state and local regulations for containment and clean-up.

Education

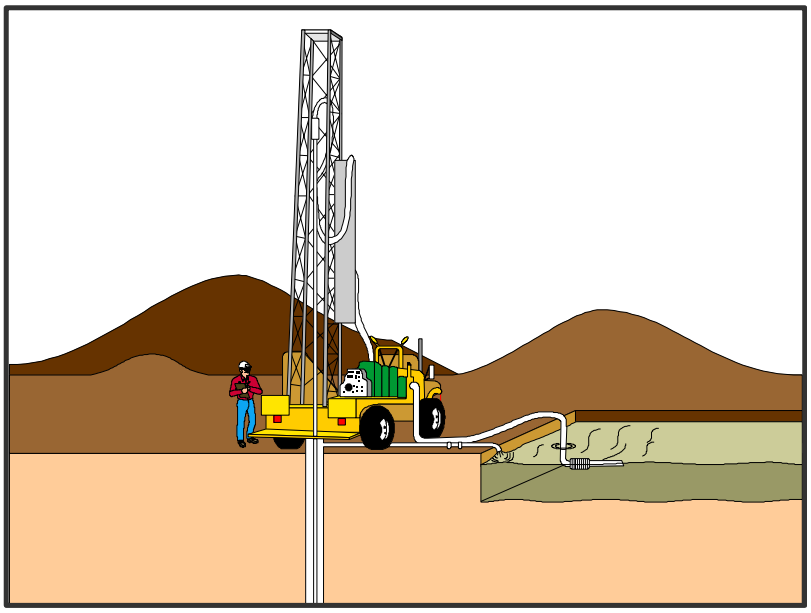
- Educate employees, subcontractors, and suppliers on sanitary and septic waste storage and disposal procedures.
- Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary and septic wastes.
- Instruct employees, subcontractors, and suppliers in identification of sanitary and septic waste.
- Hold regular meetings to discuss and reinforce the use of sanitary facilities (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

Costs

All of the above are low cost measures.

Sanitary/Septic Waste Management WM-9

Inspection and Maintenance



- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for regular waste collection.
- If high winds are expected, portable sanitary facilities must be secured with spikes or weighed down to prevent over turning.
- If spills or leaks from sanitary or septic facilities occur that are not contained and discharge from the site, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Liquid Waste Management WM-10

Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

concrete slurry residue (WM-8, Concrete Waste Management).

- Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and discharges or flows from emergency fire fighting activities.

Implementation

General Practices

- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage device, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Verify which non-stormwater discharges are permitted by the statewide NPDES permit; different regions might have different requirements not outlined in this permit.
- Apply NS-8, Vehicle and Equipment Cleaning for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids should not be allowed to enter storm drains and watercourses and should be disposed of.
- If an appropriate location is available, drilling residue and drilling fluids that are exempt under Title 23, CCR § 2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the provisions concerning the Temporary Concrete Washout Facilities detailed in WM-8, Concrete Waste Management.
- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, should be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.
- Liquid wastes should be contained in a controlled area such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.

- Precautions should be taken to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in WM-4, Spill Prevention and Control.

- Containment areas or devices should not be located where accidental release of the contained liquid can threaten health or safety or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes that have the potential to affect the storm drainage system (such as wash water and rinse water from cleaning walls or pavement), before they run off a surface.

- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.

- Use a sediment trap (SE-3, Sediment Trap) for capturing and treating sediment laden liquid waste or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- A typical method to handle liquid waste is to dewater the contained liquid waste, using procedures such as described in NS-2, Dewatering Operations, and SE-2, Sediment Basin, and dispose of resulting solids per WM-5, Solid Waste Management.

- Methods of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 or 404 permits, and local agency discharge permits, etc. Review the SWPPP to see if disposal methods are identified.

- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management.

- If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.

Costs

Prevention costs for liquid waste management are minimal. Costs increase if cleanup or fines are involved.

Inspection and Maintenance

- Inspect and verify that activity–based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect weekly during the rainy season and of two-week intervals in the non-rainy season to verify continued BMP implementation.

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.

- Remove deposited solids in containment areas and capturing devices as needed and at the completion of the task. Dispose of any solids as described in WM-5, Solid Waste Management.
- Inspect containment areas and capturing devices and repair as needed.

I. BACKGROUND

A. History

In 1972, the Federal Water Pollution Control Act (also referred to as the Clean Water Act [CWA]) was amended to provide that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The 1987 amendments to the CWA added Section 402(p), which establishes a framework for regulating municipal and industrial storm water discharges under the NPDES Program. On November 16, 1990, the U.S. Environmental Protection Agency (USEPA) published final regulations that established storm water permit application requirements for specified categories of industries. The regulations provide that discharges of storm water to waters of the United States from construction projects that encompass five or more acres of soil disturbance are effectively prohibited unless the discharge is in compliance with an NPDES Permit. Regulations (Phase II Rule) that became final on December 8, 1999 lowered the permitting threshold from five acres to one acre.

While federal regulations allow two permitting options for storm water discharges (Individual Permits and General Permits), the State Water Board has elected to adopt only one statewide General Permit at this time that will apply to most storm water discharges associated with construction activity.

On August 19, 1999, the State Water Board reissued the General Construction Storm Water Permit (Water Quality Order 99-08-DWQ). On December 8, 1999 the State Water Board amended Order 99-08-DWQ to apply to sites as small as one acre.

The General Permit accompanying this fact sheet regulates storm water runoff from construction sites. Regulating many storm water discharges under one permit will greatly reduce the administrative burden associated with permitting individual storm water discharges. To obtain coverage under this General Permit, dischargers shall electronically file the Permit Registration Documents (PRDs), which includes a Notice of Intent (NOI), Storm Water Pollution Prevention Plan (SWPPP), and other compliance related documents required by this General Permit and mail the appropriate permit fee to the State Water Board. It is expected that as the storm water program develops, the Regional Water Quality Control Boards (Regional Water Boards) may issue General Permits or Individual Permits containing more specific permit provisions. When this occurs, this General Permit will no longer regulate those dischargers.

B. Legal Challenges and Court Decisions

1. Early Court Decisions

Shortly after the passage of the CWA, the USEPA promulgated regulations exempting most storm water discharges from the NPDES permit requirements. (See 40 C.F.R. § 125.4 (1975); see also *Natural Resources Defense Council v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1372 (*Costle*); *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1163 (*Defenders of Wildlife*).) When environmental groups challenged this exemption in federal court, the District of Columbia Court of Appeals invalidated the regulation, holding that the USEPA "does not have authority to exempt categories of point sources from the permit requirements of [CWA] § 402." (*Costle*, 568 F.2d at 1377.) The *Costle* court rejected the USEPA's argument that effluent-based storm sewer regulation was administratively infeasible because of the variable nature of storm water pollution and the number of affected storm sewers throughout the country. (*Id.* at 1377-82.) Although the court acknowledged the practical problems relating to storm sewer regulation, the court found the USEPA had the flexibility under the CWA to design regulations that would overcome these problems. (*Id.* at 1379-83.) In particular, the court pointed to general permits and permits based on requiring best management practices (BMPs).

During the next 15 years, the USEPA made numerous attempts to reconcile the statutory requirement of point source regulation with the practical problem of regulating possibly millions of diverse point source discharges of storm water. (See *Defenders of Wildlife*, 191 F.3d at 1163; see also Gallagher, Clean Water Act in Environmental Law Handbook (Sullivan, edit., 2003)
p. 300 (Environmental Law Handbook); Eisen, *Toward a Sustainable Urbanism: Lessons from Federal Regulation of Urban Storm Water Runoff* (1995) 48 Wash. U.J. Urb. & Contemp. L.1, 40-41 [Regulation of Urban Storm Water Runoff].)

In 1987, Congress amended the CWA to require NPDES permits for storm water discharges. (See CWA § 402(p), 33 U.S.C. § 1342(p); *Defenders of Wildlife,* 191 F.3d at 1163; *Natural Resources Defense Council v. USEPA* (9th Cir. 1992) 966 F.2d 1292, 1296.) In these amendments, enacted as part of the Water Quality Act of 1987, Congress distinguished between industrial and municipal storm water discharges. With respect to industrial storm water discharges, Congress provided that NPDES permits "shall meet all applicable provisions of this section and section 1311 [requiring the USEPA to establish effluent limitations under specific timetables]." (CWA § 402(p)(3)(A), 33 U.S.C. § 1342(p)(3)(A); see also *Defenders of Wildlife,* 191 F.3d at 1163-64.)

In 1990, USEPA adopted regulations specifying what activities were considered “industrial” and thus required discharges of storm water associated with those activities to obtain coverage under NPDES permits. (55 Fed. Reg. 47,990 (1990); 40 C.F.R. § 122.26(b)(14).) Construction activities, deemed a subset of the industrial activities category, must also be regulated by an NPDES permit. (40 C.F.R. § 122.26(b)(14)(x)). In 1999, USEPA issued regulations for “Phase II” of storm water regulation, which required most small construction sites (1-5 acres) to be regulated under the NPDES program. (64 Fed. Reg. 68,722; 40 C.F.R. § 122.26(b)(15)(i).)

2. Court Decisions on Public Participation

Two recent federal court opinions have vacated USEPA rules that denied meaningful public review of NPDES permit conditions. On January 14, 2003, the Ninth Circuit Court of Appeals held that certain aspects of USEPA’s Phase II regulations governing MS4s were invalid primarily because the general permit did not contain express requirements for public participation. (*Environmental Defense Center v. USEPA* (9th Cir. 2003) 344 F.3d 832.) Specifically, the court determined that applications for general permit coverage (including the Notice of Intent (NOI) and Storm Water Management Program (SWMP)) must be made available to the public, the applications must be reviewed and determined to meet the applicable standard by the permitting authority before coverage commences, and there must be a process to accommodate public hearings. (*Id.* at 852-54.) Similarly, on February 28, 2005, the Second Circuit Court of Appeals held that the USEPA's confined animal feeding operation (CAFO) rule violated the CWA because it allowed dischargers to write their own nutrient management plans without public review. (*Waterkeeper Alliance v. USEPA* (2d Cir. 2005) 399 F.3d 486.) Although neither decision involved the issuance of construction storm water permits, the State Water Board’s Office of Chief Counsel has recommended that the new General Permit address the courts’ rulings where feasible[1].

[1] In *Texas Independent Producers and Royalty Owners Assn. v. USEPA* (7th Cir. 2005) 410 F.3d 964, the Seventh Circuit Court of Appeals held that the USEPA’s construction general permit was not required to provide the public with the opportunity for a public hearing on the Notice of Intent or Storm Water Pollution Prevention Plan. The Seventh Circuit briefly discussed why it agreed with the Ninth Circuit’s dissent in *Environmental Defense Center*, but

The CWA and the USEPA's regulations provide states with the discretion to formulate permit terms, including specifying best management practices (BMPs), to achieve strict compliance with federal technology-based and water quality-based standards. (*Natural Resources Defense Council v. USEPA* (9th Cir. 1992) 966 F.2d 1292, 1308.) Accordingly, this General Permit has developed specific BMPs as well as numeric action levels (NALs) in order to achieve these minimum federal standards. In addition, the General Permit requires a SWPPP and REAP (another dynamic, site-specific plan) to be developed but has removed all language requiring the discharger to implement these plans – instead, the discharger is required to comply with specific requirements. By requiring the dischargers to implement these specific BMPs and NALs, this General Permit ensures that the dischargers do not "write their own permits." As a result this General Permit does not require each discharger's SWPPP and REAP to be reviewed and approved by the Regional Water Boards.

This General Permit also requires dischargers to electronically file all permit-related compliance documents. These documents include, but are not limited to, NOIs, SWPPPs, annual reports, Notice of Terminations (NOTs), and numeric action level (NAL) exceedance reports. Electronically submitted compliance information is immediately available to the public, as well as the Regional Water Quality Control Board (Regional Water Board) offices, via the Internet. In addition, this General Permit enables public review and hearings on permit applications when appropriate. Under this General Permit, the public clearly has a meaningful opportunity to participate in the permitting process.

---

generally did not discuss the substantive holdings in *Environmental Defense Center* and *Waterkeeper Alliance*, because neither court addressed the initial question of whether the plaintiffs had standing to challenge the permits at issue. However, notwithstanding the Seventh Circuit's decision, it is not binding or controlling on the State Water Board because California is located within the Ninth Circuit.

C. Blue Ribbon Panel of Experts and Feasibility of Numeric Effluent Limitations

In 2005 and 2006, the State Water Board convened an expert panel (panel) to address the feasibility of numeric effluent limitations (NELs) in California's storm water permits. Specifically, the panel was asked to address:

"Is it technically feasible to establish numeric effluent limitations, or some other quantifiable limit, for inclusion in storm water permits? How would such limitations or criteria be established, and what information and data would be required?"

"The answers should address industrial general permits, construction general permits, and area-wide municipal permits. The answers should also address both technology-based limitations or criteria and water quality-based limitations or criteria. In evaluating establishment of any objective criteria, the panel should address all of the following:

The ability of the State Water Board to establish appropriate objective limitations or criteria;

How compliance determinations would be made;

The ability of dischargers and inspectors to monitor for compliance; and

The technical and financial ability of dischargers to comply with the limitations or criteria."

Through a series of public participation processes (State Water Board meetings, State Water Board workshops, and the solicitation of written comments), a number of water quality, public process and overall program effectiveness problems were identified. Some of these problems are addressed through this General Permit.

D. Summary of Panel Findings on Construction Activities

The panel's final report can be downloaded and viewed through links at www.waterboards.ca.gov or by clicking here[2].

The panel made the following observations:

"Limited field studies indicate that traditional erosion and sediment controls are highly variable in performance, resulting in highly variable turbidity levels in the site discharge."

"Site-to-site variability in runoff turbidity from undeveloped sites can also be quite large in many areas of California, particularly in more arid regions with less natural vegetative cover and steep slopes."

---

[2] http://www.waterboards.ca.gov/stormwtr/docs/numeric/swpanel_final_report.pdf

"Active treatment technologies involving the use of polymers with relatively large storage systems now exist that can provide much more consistent and very low discharge turbidity. However, these technologies have as yet only been applied to larger construction sites, generally five acres or greater. Furthermore, toxicity has been observed at some locations, although at the vast majority of sites, toxicity has not occurred. There is also the potential for an accidental large release of such chemicals with their use."

"To date most of the construction permits have focused on TSS and turbidity, but have not addressed other, potentially significant pollutants such as phosphorus and an assortment of chemicals used at construction sites."

"Currently, there is no required training or certification program for contractors, preparers of soil erosion and sediment control Storm Water Pollution Prevention Plans, or field inspectors."

"The quality of storm water discharges from construction sites that effectively employ BMPs likely varies due to site conditions such as climate, soil, and topography."

"The States of Oregon and Washington have recently adopted similar concepts to the Action Levels described earlier."

In addition, the panel made the following conclusions:

"It is the consensus of the Panel that active treatment technologies make Numeric Limits technically feasible for pollutants commonly associated with storm water discharges from construction sites (e.g. TSS and turbidity) for larger construction sites. Technical practicalities and cost-effectiveness may make these technologies less feasible for smaller sites, including small drainages within a larger site, as these technologies have seen limited use at small construction sites. If chemical addition is not permitted, then Numeric Limits are not likely feasible."

"The Board should consider Numeric Limits or Action Levels for other pollutants of relevance to construction sites, but in particular pH. It is of particular concern where fresh concrete or wash water from cement mixers/equipment is exposed to storm water."

"The Board should consider the phased implementation of Numeric Limits and Action Levels, commensurate with the capacity of the dischargers and support industry to respond."

E. How the Panel's Findings are Used in this General Permit

The State Water Board carefully considered the findings of the panel and related public comments. The State Water Board also reviewed and considered the comments regarding statewide storm water policy and the reissuance of the Industrial General Permit. From the input received the State Water Board identified some permit and program performance gaps that are addressed in this General Permit. The Summary of Significant Changes (below) in this General Permit are a direct result of this process.

F. Summary of Significant Changes in This General Permit

The State Water Board has significant changes to Order 99-08-DWQ. This General Permit differs from Order 99-08-DWQ in the following significant ways:

Rainfall Erosivity Waiver: this General Permit includes the option allowing a small construction site (>1 and <5 acres) to self-certify if the rainfall erosivity value (R value) for their site's given location and time frame compute to be less than or equal to 5.

Technology-Based Numeric Action Levels: this General Permit includes NALs for pH and turbidity.

Risk-Based Permitting Approach: this General Permit establishes three levels of risk possible for a construction site. Risk is calculated in two parts: 1) Project Sediment Risk, and 2) Receiving Water Risk.

Minimum Requirements Specified: this General Permit imposes more minimum BMPs and requirements that were previously only required as elements of the SWPPP or were suggested by guidance.

Project Site Soil Characteristics Monitoring and Reporting: this General Permit provides the option for dischargers to monitor and report the soil characteristics at their project location. The primary purpose of this requirement is to provide better risk determination and eventually better program evaluation.

Effluent Monitoring and Reporting: this General Permit requires effluent monitoring and reporting for pH and turbidity in storm water discharges. The purpose of this monitoring is to evaluate whether NALs and NELs for Active Treatment Systems included in this General Permit are exceeded.

Receiving Water Monitoring and Reporting: this General Permit requires some Risk Level 3 and LUP Type 3 dischargers to monitor receiving waters and conduct bioassessments.

Post-Construction Storm Water Performance Standards: this General Permit specifies runoff reduction requirements for all sites not covered by a Phase I or Phase II MS4 NPDES permit, to avoid, minimize and/or mitigate post-construction storm water runoff impacts.

Rain Event Action Plan: this General Permit requires certain sites to develop and implement a Rain Event Action Plan (REAP) that must be designed to protect all exposed portions of the site within 48 hours prior to any likely precipitation event.

Annual Reporting: this General Permit requires all projects that are enrolled for more than one continuous three-month period to submit information and annually certify that their site is in compliance with these requirements. The primary purpose of this requirement is to provide information needed for overall program evaluation and pubic information.

Certification/Training Requirements for Key Project Personnel: this General Permit requires that key personnel (e.g., SWPPP preparers, inspectors, etc.) have specific training or certifications to ensure their level of knowledge and skills are adequate to ensure their ability to design and evaluate project specifications that will comply with General Permit requirements.

Linear Underground/Overhead Projects: this General Permit includes requirements for all Linear Underground/Overhead Projects (LUPs).

II. RATIONALE

A. General Permit Approach

A general permit for construction activities is an appropriate permitting approach for the following reasons:

1. A general permit is an efficient method to establish the essential regulatory requirements for a broad range of construction activities under differing site conditions;

2. A general permit is the most efficient method to handle the large number of construction storm water permit applications;

3. The application process for coverage under a general permit is far less onerous than that for individual permit and hence more cost effective;

4. A general permit is consistent with USEPA's four-tier permitting strategy, the purpose of which is to use the flexibility provided by the CWA in designing a workable and efficient permitting system; and

5. A general permit is designed to provide coverage for a group of related facilities or operations of a specific industry type or group of industries. It is appropriate when the discharge characteristics are sufficiently similar, and a standard set of permit requirements can effectively provide environmental protection and comply with water quality standards for discharges. In most cases, the general permit will provide sufficient and appropriate management requirements to protect the quality of receiving waters from discharges of storm water from construction sites.

There may be instances where a general permit is not appropriate for a specific construction project. A Regional Water Board may require any discharger otherwise covered under the General Permit to apply for and obtain an Individual Permit or apply for coverage under a more specific General Permit. The Regional Water Board must determine that this General Permit does not provide adequate assurance that water quality will be protected, or that there is a site-specific reason why an individual permit should be required.

B. Construction Activities Covered

1. **Construction activity subject to this General Permit:**

Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre.

Construction activity that results in land surface disturbances of less than one acre if the construction activity is part of a larger common plan of development or sale of one or more acres of disturbed land surface.

Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to USEPA regulations, such as dairy barns or food processing facilities.

Construction activity associated with LUPs including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete

and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.[3]

Storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction[4] (upland sites) and that disturb one or more acres of land surface from construction activity are covered by this General Permit. Construction projects that intend to disturb one or more acres of land within the jurisdictional boundaries of a CWA § 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the project.

2. Linear Underground/Overhead Projects (LUPs) subject to this General Permit:

Underground/overhead facilities typically constructed as LUPs include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water, wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

Water Quality Order 2003-0007-DWQ regulated construction activities associated with small LUPs that resulted in land disturbances greater than one acre, but less than five acres. These projects were considered non-traditional construction projects. Attachment A of this Order now regulates all construction activities from LUPs resulting in land disturbances greater than one acre.

3. Common Plan of Development or Sale

USEPA regulations include the term “common plan of development or sale” to ensure that acreage within a common project does not artificially escape the permit requirements because construction activities are phased, split among smaller parcels, or completed by different owners/developers. In the absence of an

---

[3] Pursuant to the Ninth Circuit Court of Appeals’ decision in *NRDC v. EPA* (9th Cir. 2008) 526 F.3d 591, and subsequent denial of the USEPA’s petition for reconsideration in November 2008, oil and gas construction activities discharging storm water contaminated only with sediment are no longer exempt from the NPDES program.

[4] A construction site that includes a dredge and/or fill discharge to any water of the United States (e.g., wetland, channel, pond, or marine water) requires a CWA Section 404 permit from the U.S. Army Corps of Engineers and a CWA Section 401 Water Quality Certification from the Regional Water Board or State Water Board.

exact definition of “common plan of development or sale,” the State Water Board is required to exercise its regulatory discretion in providing a common sense interpretation of the term as it applies to construction projects and permit coverage. An overbroad interpretation of the term would render meaningless the clear “one acre” federal permitting threshold and would potentially trigger permitting of almost any construction activity that occurs within an area that had previously received area-wide utility or road improvements.

Construction projects generally receive grading and/or building permits (Local Permits) from local authorities prior to initiating construction activity. These Local Permits spell out the scope of the project, the parcels involved, the type of construction approved, etc. Referring to the Local Permit helps define “common plan of development or sale.” In cases such as tract home development, a Local Permit will include all phases of the construction project including rough grading, utility and road installation, and vertical construction. All construction activities approved in the Local Permit are part of the common plan and must remain under the General Permit until construction is completed. For custom home construction, Local Permits typically only approve vertical construction as the rough grading, utilities, and road improvements were already independently completed under the a previous Local Permit. In the case of a custom home site, the homeowner must submit plans and obtain a distinct and separate Local Permit from the local authority in order to proceed. It is not the intent of the State Water Board to require permitting for an individual homeowner building a custom home on a private lot of less than one acre if it is subject to a separate Local Permit. Similarly, the installation of a swimming pool, deck, or landscaping that disturbs less than one acre that was not part of any previous Local Permit are not required to be permitted.

The following are several examples of construction activity of less than one acre that would require permit coverage:

a. A landowner receives a building permit(s) to build tract homes on a 100-acre site split into 200 one-third acre parcels, (the remaining acreage consists of streets and parkways) which are sold to individual homeowners as they are completed. The landowner completes and sells all the parcels except for two. Although the remaining two parcels combined are less than one acre, the landowner must continue permit coverage for the two parcels.

b. One of the parcels discussed above is sold to another owner who intends to complete the construction as already approved in the Local Permit. The new landowner must file Permit Registration Documents (PRDs) to complete the construction even if the new landowner is required to obtain a separate Local Permit.

c. Landowner in (1) above purchases 50 additional one half-acre parcels adjacent to the original 200-acre project. The landowner seeks a Local Permit (or amendment to existing Local permit) to build on 20 parcels while leaving the remaining 30 parcels for future development. The landowner must amend PRDs to include the 20 parcels 14 days prior to commencement of construction activity on those parcels.

C. Construction Activities Not Covered

1. Traditional Construction Projects Not Covered

This General Permit does not apply to the following construction activity:

a. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

b. Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation.

c. Discharges of storm water from areas on tribal lands; construction on tribal lands is regulated by a federal permit.

d. Discharges of storm water within the Lake Tahoe Hydrologic Unit. The Lahontan Regional Water Board has adopted its own permit to regulate storm water discharges from construction activity in the Lake Tahoe Hydrologic Unit (Regional Water Board 6SLT). Owners of construction projects in this watershed must apply for the Lahontan Regional Water Board permit rather than the statewide Construction General Permit. Construction projects within the Lahontan region must also comply with the Lahontan Region Project Guideline for Erosion Control (R6T-2005-0007 Section), which can be found at **http://www.waterboards.ca.gov/lahontan/Adopted_Orders/2005/r6t_2005_0007.pdf**

e. Construction activity that disturbs less than one acre of land surface, unless part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

f. Construction activity covered by an individual NPDES Permit for storm water discharges.

g. Landfill construction activity that is subject to the Industrial General Permit.

h. Construction activity that discharges to Combined Sewer Systems.

i. Conveyances that discharge storm water runoff combined with municipal sewage.

j. Discharges of storm water identified in CWA § 402(*l*)(2), 33 U.S.C. § 1342(*l*)(2).

2. **Linear Projects Not Covered**

a. LUP construction activity does not include linear routine maintenance projects. Routine maintenance projects are projects associated with operations and maintenance activities that are conducted on existing lines and facilities and within existing right-of-way, easements, franchise agreements, or other legally binding agreements of the discharger. Routine maintenance projects include, but are not limited to projects that are conducted to:

i. Maintain the original purpose of the facility or hydraulic capacity.

ii. Update existing lines[5] and facilities to comply with applicable codes, standards, and regulations regardless if such projects result in increased capacity.

iii. Repairing leaks.

[5]Update existing lines includes replacing existing lines with new materials or pipes.

Routine maintenance does not include construction of new[6] lines or facilities resulting from compliance with applicable codes, standards, and regulations.

Routine maintenance projects do not include those areas of maintenance projects that are outside of an existing right-of-way, franchise, easements, or agreements. When a project must secure new areas, those areas may be subject to this General Permit based on the area of disturbed land outside the original right-of-way, easement, or agreement.

b. LUP construction activity does not include field activities associated with the planning and design of a project (e.g., activities associated with route selection).

c. Tie-ins conducted immediately adjacent to "energized" or "pressurized" facilities by the discharger are not considered construction activities where all other LUP construction activities associated with the tie-in are covered by an NOI and SWPPP of a third party or municipal agency.

3. **EPA's Small Construction Rainfall Erosivity Waiver**

EPA's Storm Water Phase II Final Rule provides the option for a Small Construction Rainfall Erosivity Waiver. This waiver applies to small construction sites between 1 and 5 acres, and allows permitting authorities to waive those sites that do not have adverse water quality impacts.

Dischargers eligible for this waiver are exempt from Construction General Permit Coverage. In order to obtain the waiver, the discharger must certify to the State Water Board that small construction activity will occur only when the rainfall erosivity factor is less than 5 ("R" in the Revised Universal Soil Loss Equation). The period of construction activity begins at initial earth disturbance and ends with final stabilization. Where vegetation will be used for final stabilization, the date of installation of a practice that provides interim non-vegetative stabilization can be used for the end of the construction period. The operator must agree (as a condition waiver eligibility) to periodically inspect and properly maintain the area until the criteria for final stabilization as defined in the General Permit have been met. If use of this interim stabilization eligibility condition was relied on to qualify for the waiver, signature on the waiver with a certification statement constitutes acceptance of and commitment to complete the final stabilization process. The discharger must submit a waiver certification to the State Board prior to commencing construction activities.

USEPA funded a cooperative agreement with Texas A&M University to develop an online rainfall erosivity calculator. Dischargers can access the calculator from EPA's website at: www.epa.gov/npdes/stormwater/cgp. Use of the calculator allows the discharger to determine potential eligibility for the rainfall erosivity waiver. It may also be useful in determining the time periods during which construction activity could be waived from permit coverage.

[6]New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

D. Obtaining and Terminating Permit Coverage

The appropriate Legally Responsible Person (LRP) must obtain coverage under this General Permit. To obtain coverage, the LRP or the LRP's Approved Signatory must file Permit Registration Documents (PRDs) prior to the commencement of construction activity. Failure to obtain coverage under this General Permit for storm water discharges to waters of the United States is a violation of the CWA and the California Water Code.

To obtain coverage under this General Permit, LRPs must electronically file the PRDs, which include a Notice of Intent (NOI), Storm Water Pollution Prevention Plan (SWPPP), and other documents required by this General Permit, and mail the appropriate permit fee to the State Water Board. It is expected that as the storm water program develops, the Regional Water Boards may issue General Permits or Individual Permits that contain more specific permit provisions. When this occurs, this General Permit will no longer regulate those dischargers that obtain coverage under Individual Permits.

Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

The application requirements of the General Permit establish a mechanism to clearly identify the responsible parties, locations, and scope of operations of dischargers covered by the General Permit and to document the discharger's knowledge of the General Permit's requirements.

This General Permit provides a grandfathering exception to existing dischargers subject to Water Quality Order No. 99-08-DWQ. Construction projects covered under Water Quality Order No. 99-08-DWQ shall obtain permit coverage at Risk Level 1. LUP projects covered under Water Quality Order No. 2003-0007-DWQ shall obtain permit coverage at LUP Type 1. The Regional Water Boards have the authority to require Risk Determination to be performed on projects currently covered under Water Quality Order No. 99-08-DWQ and 2003-0007-DWQ where they deem necessary.

LRPs must file a Notice of Termination (NOT) with the Regional Water Board when construction is complete and final stabilization has been reached or ownership has been transferred. The discharger must certify that all State and local requirements have been met in accordance with this General Permit. In order for construction to be found complete, the discharger must install post-construction storm water management measures and establish a long-term maintenance plan. This requirement is intended to ensure that the post-construction conditions at the project site do not cause or contribute to direct or indirect water quality impacts (i.e., pollution and/or hydromodification) upstream and downstream. Specifically, the discharger must demonstrate compliance with the post-construction standards set forth in this General Permit (Section XIII). The discharger is responsible for all compliance issues including all annual fees until the NOT has been filed and approved by the local Regional Water Board.

E. Discharge Prohibitions

This General Permit authorizes the discharge of storm water to surface waters from construction activities that result in the disturbance of one or more acres of land, provided that the discharger satisfies all permit conditions set forth in the Order. This General Permit prohibits the discharge of pollutants other than storm water and non-storm water discharges authorized by this General Permit or another NPDES permit. This General Permit also prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges. In addition, this General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the nine Regional Water Boards. Discharges to Areas of Special Biological Significance (ASBS) are prohibited unless covered by an exception that the State Water Board has approved.

Non-storm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Non-storm water discharges may contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural BMPs. The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction projects. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water dewatering, and other discharges not subject to a separate general NPDES permit adopted by a region. Therefore this General Permit authorizes such discharges provided they meet the following conditions.

These authorized non-storm water discharges must:

1. be infeasible to eliminate;
2. comply with BMPs as described in the SWPPP;
3. filter or treat, using appropriate technology, all dewatering discharges from sedimentation basins;
4. meet the NALs for pH and turbidity; and
5. not cause or contribute to a violation of water quality standards.

Additionally, authorized non-storm water discharges must not be used to clean up failed or inadequate construction or post-construction BMPs designed to keep materials onsite. Authorized non-storm water dewatering discharges may require a permit because some Regional Water Boards have adopted General Permits for dewatering discharges.

This General Permit prohibits the discharge of storm water that causes or threatens to cause pollution, contamination, or nuisance.

F. Effluent Standards for All Types of Discharges

1. Technology-Based Effluent Limitations

Permits for storm water discharges associated with construction activity must meet all applicable provisions of Sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize best available technology economically achievable (BAT) for toxic pollutants and non conventional pollutants and best conventional pollutant control technology (BCT) for conventional pollutants. Additionally, these provisions require controls of pollutant discharges to reduce pollutants and any more stringent controls necessary to meet water quality standards. The USEPA has already established such limitations, known as effluent limitation guidelines (ELGs), for some industrial categories. This is not the case with construction discharges. In instances where there are no ELGs the permit writer is to use best professional judgment (BPJ) to establish requirements that the discharger must meet using BAT/BCT technology. This General Permit contains only narrative effluent limitations and does not contain numeric effluent limitations, except for Active Treatment Systems (ATS).

Order No. 2009-0009-DWQ, as originally adopted by the State Water Board on September 2, 2009, contained numeric effluent limitations for pH (within the range of 6.0 and 9.0 pH units) and turbidity (500 NTU) that applied only to Risk Level 3 and LUP Type 3 construction sites. The State Water Board adopted the numeric effluent limitations as technology-based effluent limitations based upon its best professional judgment. The California Building Industry Association, the Building Industry Legal Defense

Foundation, and the California Business Properties Association (petitioners) challenged Order No. 2009-0009-DWQ in *California Building Industry Association et al. v. State Water Resources Control Board*. On December 27, 2011, the Superior Court issued a judgment and writ of mandamus. The Superior Court ruled in favor of the State Water Board on almost all of the issues the petitioners raised, but the Superior Court invalidated the numeric effluent limitations for pH and turbidity for Risk Level 3 and LUP Type 3 sites because it determined that the State Water Board did not have sufficient BMP performance data to support those numeric effluent limitations. Therefore, the Superior Court concluded that the State Water Board did not comply with the federal regulations that apply to the use of best professional judgment. In invalidating the numeric effluent limitations, the Superior Court also suspended two ancillary requirements (a compliance storm event provision and receiving water monitoring at Risk Level 3 and LUP Type 3 sites that violated the numeric effluent limitations) that related solely to the invalidated numeric effluent limitations.

As a result of the Superior Court's writ of mandamus, this Order no longer contains numeric effluent limitations for pH and turbidity, except for ATS. In addition, as a result of the Superior Court's writ of mandamus, the receiving water monitoring requirements for Risk Level 3 and LUP Type 3 sites were suspended until the State Water Board amended this Order to restore the receiving water monitoring requirements. As amended, this Order now requires Risk Level 3 and LUP Type 3 Dischargers with direct discharges to surface waters to conduct receiving water monitoring whenever their effluent exceeds specified receiving water monitoring triggers. The receiving water monitoring triggers were established at the same levels as the previous numeric effluent limitations (effluent pH outside the range of 6.0 and 9.0 pH units or turbidity exceeding 500 NTU). In restoring the receiving water monitoring requirements, the State Water Board determined that it was appropriate to require receiving water monitoring for these types of sites with direct discharges to surface waters that exceeded the receiving water monitoring triggers under any storm event scenarios, because these sites represent the highest threat to receiving water quality. An exceedance of a receiving water monitoring trigger does not constitute a violation of this General Permit. These receiving water monitoring requirements take effect on the effective date of the amendment to this Order.

BAT/BCT technologies not only include passive systems such as conventional runoff and sediment control, but also treatment systems such as coagulation/flocculation using sand filtration, when appropriate. Such technologies allow for effective treatment of soil particles less 0.02 mm (medium silt) in diameter. The discharger must install structural controls, as necessary, such as erosion and sediment controls that meet BAT and BCT to achieve compliance with water quality standards. The narrative effluent limitations constitute compliance with the requirements of the CWA.

Because the permit is an NPDES permit, there is no legal requirement to address the factors set forth in Water Code sections 13241 and 13263, unless the permit is more stringent than what federal law requires. (See *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 618, 627.) None of the requirements in this permit are more stringent than the minimum federal requirements, which include technology-based requirements achieving BAT/BCT and strict compliance with water quality standards. The inclusion of numeric effluent limitations (NELs) in the permit for Active Treatment Systems does not cause the permit to be more stringent than current federal law. NELs and best management practices are simply two different methods of achieving the same federal requirement: strict compliance with state water quality standards. Federal law authorizes both narrative and numeric effluent limitations to meet state water quality standards. The use of NELs to achieve compliance with water quality standards is not a more stringent requirement than the use of BMPs. (State Water Board Order No. WQ 2006-0012 (*Boeing*).) Accordingly, the State Water Board does not need to take into account the factors in Water Code sections 13241 and 13263.

The State Water Board has concluded that the establishment of BAT/BCT will not create or aggravate other environmental problems through increases in air pollution, solid waste generation, or energy consumption. While there may be a slight increase in non-water quality impacts due to the implementation of additional monitoring or the construction of additional BMPs, these impacts will be negligible in comparison with the construction activities taking place on site and would be justified by the water quality benefits associated with compliance.

pH Receiving Water Monitoring Trigger

Given the potential contaminants, the minimum standard method for control of pH in runoff requires the use of preventive measures such as avoiding concrete pours during rainy weather, covering concrete and directing flow away from fresh concrete if a pour occurs during rain, covering scrap drywall and stucco materials when stored outside and potentially exposed to rain, and other housekeeping measures. If necessary, pH-impaired storm water from construction sites can be treated in a filter or settling pond or basin, with additional natural or chemical treatment required to meet pH limits set forth in this permit. The basin or pond acts as a collection point and holds storm water for a sufficient period for the contaminants to be settled out, either naturally or artificially, and allows any additional treatment to take place. The State Water Board considers these techniques to be equivalent to BCT. In determining the pH concentration trigger for discharges, the State Water Board used BPJ to set these limitations.

The chosen trigger was established by calculating three standard deviations above and below the mean pH of runoff from highway construction sites[7] in California. Proper implementation of BMPs should result in discharges that are within the range of 6.0 to 9.0 pH Units.

Turbidity Receiving Water Monitoring Trigger

The Turbidity receiving water monitoring trigger of 500 NTU is a technology-based trigger and was developed using three different analyses aimed at finding the appropriate threshold to set the technology-based limit to ensure environmental protection, effluent quality and cost-effectiveness. The analyses fell into three, main types: (1) an ecoregion-specific dataset developed by Simon et. al. (2004) [8]; (2) Statewide Regional Water Quality Control Board enforcement data; and (3) published, peer-reviewed studies and reports on in-situ performance of best management practices in terms of erosion and sediment control on active construction sites.

A 1:3 relationship between turbidity (expressed as NTU) and suspended sediment concentration (expressed as mg/L) is assumed based on a review of suspended sediment and turbidity data from three gages used in the USGS National Water Quality Assessment Program:

USGS 11074000 SANTA ANA R BL PRADO DAM CA
USGS 11447650 SACRAMENTO R A FREEPORT CA
USGS 11303500 SAN JOAQUIN R NR VERNALIS CA

The receiving water monitoring trigger represents staff determination that the trigger value is the most practicable based on available data. The turbidity receiving water monitoring trigger represents a bridge between the narrative effluent limitations and receiving water limitations. To support this receiving water monitoring trigger, State Water Board staff analyzed construction site discharge information (monitoring data, estimates) and receiving water monitoring information.

Since the turbidity receiving water monitoring trigger represents an appropriate threshold level expected at a site, compliance with this value does not necessarily represent compliance with either the narrative effluent limitations (as enforced through the BAT/BCT standard) or the receiving water limitations. In the San Diego region, some inland surface waters have a receiving water objective for turbidity equal to 20 NTU. Obviously a discharge up to, but not exceeding, the turbidity receiving water monitoring trigger of

[7] Caltrans Construction Sites Runoff Characterization Study, 2002. Available at: http://www.dot.ca.gov/hq/env/stormwater/pdf/CTSW-RT-02-055.pdf.

500 NTU may still cause or contribute to the exceedance of the 20 NTU standard. Most of the waters of the State are protected by turbidity objectives based on background conditions.

Table 1 - Regional Water Board Basin Plans, Water Quality Objectives for Turbidity

REGIONAL WATER BOARD	WQ Objective	Background/Natural Turbidity	Maximum Increase
1	Based on background	All levels	20%
2	Based on background	> 50 NTU	10%
3	Based on background	0-50 JTU 50-100 JTU > 100 JTU	20% 10 NTU 10%
4	Based on background	0-50 NTU > 50 NTU	20% 10%
5	Based on background	0-5 NTU 5-50 NTU 50-100 NTU >100 NTU	1 NTU 20% 10 NTU 10%
6	Based on background	All levels	10%
7	Based on background	N/A	N/A
8	Based on background	0-50 NTU 50-100 NTU >100 NTU	20% 10 NTU 10%
9	Inland Surface Waters, 20 NTU All others, based on background	 0-50 NTU 50-100 NTU >100 NTU	 20% 10 NTU 10%

Table 2 shows the suspended sediment concentrations at the 1.5 year flow recurrence interval for the 12 ecoregions in California from Simon et. al (2004).

Table 2 - Results of Ecoregion Analysis

Ecoregion	Percent of California Land Area	Median Suspended Sediment Concentration (mg/L)
1	9.1	874
4	0.2	120
5	8.8	35.6
6	20.7	1530
7	7.7	122
8	3.0	47.4
9	9.4	284
13	5.2	143
14	21.7	5150
78	8.1	581
80	2.4	199
81	3.7	503
Area-weighted average		1633

If a 1:3 relationship between turbidity and suspended sediment is assumed, the median turbidity is 544 NTU.

The following table is composed of turbidity readings measured in NTUs from administrative civil liability (ACL) actions for construction sites from 2003 - 2009. This data was derived from the complete listing of construction-related ACLs for the six year period. All ACLs were reviewed and those that included turbidimeter readings at the point of storm water discharge were selected for this dataset.

Table 3 – ACL Sampling Data taken by Regional Water Board Staff

WDID#	Region	Discharger	Turbidity (NTU)
5S34C331884	5S	Bradshaw Interceptor Section 6B	1800

5S48C336297	5S	Cheyenne at Browns Valley	1629
5R32C314271	5R	Grizzly Ranch Construction	1400
6A090406008	6T	El Dorado County Department of Transportation, Angora Creek	97.4
5S03C346861	5S	TML Development, LLC	1600
6A31C325917	6T	Northstar Village	See Subdata Set

Subdata Set - Turbidity for point of storm water runoff discharge at Northstar Village

Date	Turbidity (NTU)	Location
10/5/2006	900	Middle Martis Creek
11/2/2006	190	Middle Martis Creek
01/04/2007	36	West Fork, West Martis Creek
02/08/2007	180	Middle Martis Creek
02/09/2007	130	Middle Martis Creek
02/09/2007	290	Middle Martis Creek
02/09/2007	100	West Fork, West Martis Creek
02/10/2007	28	Middle Martis Creek
02/10/2007	23	Middle Martis Creek
02/10/2007	32	Middle Martis Creek
02/10/2007	12	Middle Martis Creek
02/10/2007	60	West Fork, West Martis Creek
02/10/2007	34	West Fork, West Martis Creek

A 95% confidence interval for mean turbidity in an ACL order was constructed. The data set used was a small sample size, so the 500 NTU (the value derived as the receiving water monitoring trigger for this General Permit) needed to be verified as a possible population mean. In this case, the population refers to a hypothetical population of turbidity measurements of which our sample of 20 represents. A t-distribution was assumed due to the small sample size:

Mean: 512.23 NTU
Standard Deviation: 686.85
Margin of Error: 321.45
Confidence Interval: 190.78 NTU (Low)
833.68 NTU (High)

Based on a constructed 95% confidence interval, an ACL order turbidity measurement will be between 190.78 – 833.68 NTU. 500 NTU falls within this range. Using the same data set, a small-sample hypothesis test was also performed to test if the ACL turbidity data set contains enough information to cast doubt on choosing a 500 NTU as a mean. 500 NTU was again chosen due to its proposed use as an acceptable value. The test was carried out using a 95% confidence interval. Results indicated that the ACL turbidity data set *does not* contain significant sample evidence to reject the claim of 500 NTU as an acceptable mean for the ACL turbidity population.

There are not many published, peer-reviewed studies and reports on in-situ performance of best management practices in terms of erosion and sediment control on active construction sites. The most often cited study is a report titled, "Improving the Cost Effectiveness of Highway Construction Site Erosion and Pollution Control" (Horner, Guedry, and Kortenhof 1990, http://www.wsdot.wa.gov/Research/Reports/200/200.1.htm). In a comment letter summarizing this report sent to the State Water Board, the primary author, Dr. Horner, states:

"The most effective erosion control product was wood fiber mulch applied at two different rates along with a bonding agent and grass seed in sufficient time before the tests to achieve germination. Plots treated in this way reduced influent turbidity by more than 97 percent and discharged effluent exhibiting mean and maximum turbidity values of 21 and 73 NTU, respectively. Some other mulch and blanket materials performed nearly as well. These tests demonstrated the control ability of widely available BMPs over a very broad range of erosion potential."

Other technologies studied in this report produced effluent quality at or near 100 NTU. It is the BPJ of the State Water Board staff that erosion control, while preferred, is not always an option on construction sites and that technology performance in a controlled study showing effluent quality directly leaving a BMP is always easier and cheaper to control than effluent being discharged from the project (edge of property, etc.). As a result, it is the BPJ of the State Water Board staff that it is not cost effective or feasible, at this time, for all risk level and type 3 sites in California to achieve effluent discharges with turbidity values that are less than 100 NTU.

To summarize, the analysis showed that: (1) results of the Simon et. al dataset reveals turbidity values in background receiving water in California's ecoregions range from 16 NTU to 1716 NTU (with a mean of 544 NTU); (2) based on a constructed 95% confidence interval, construction sites will be subject to administrative civil liability (ACL) when their turbidity measurement falls between 190.78 – 833.68 NTU; and (3) sites with highly controlled discharges employing and maintaining good erosion control practices can discharge effluent from the BMP with turbidity values less than 100 NTU. State Water Board staff has determined, using its BPJ, that it is most cost effective to set the receiving water monitoring trigger for turbidity at 500 NTU.

i. *Compliance Storm Event*

While this General Permit no longer contains "compliance storm event" exceptions from technology-based NELs, the "compliance storm event" exception from the ATS NELs remain in effect. See Section K of this Fact Sheet, and Attachment F of this General Permit for more information.

a. TMDLs and Waste Load Allocations

Dischargers located within the watershed of a CWA § 303(d) impaired water body, for which a TMDL for sediment has been adopted by the Regional Water Board or USEPA, must comply with the approved TMDL if it identifies "construction activity" or land disturbance as a source of sediment. If it does, the

TMDL should include a specific waste load allocation for this activity/source. The discharger, in this case, may be required by a separate Regional Water Board order to implement additional BMPs, conduct additional monitoring activities, and/or comply with an applicable waste load allocation and implementation schedule. If a specific waste load allocation has been established that would apply to a specific discharge, the Regional Water Board may adopt an order requiring specific implementation actions necessary to meet that allocation. In the instance where an approved TMDL has specified a general waste load allocation to construction storm water discharges, but no specific requirements for construction sites have been identified in the TMDL, dischargers must consult with the state TMDL authority[9] to confirm that adherence to a SWPPP that meets the requirements of the General Permit will be consistent with the approved TMDL.

2. Determining Compliance with Effluent Standards

a. Technology-Based Numeric Action Levels (NALs)

This General Permit contains technology-based NALs for pH and turbidity, and requirements for effluent monitoring at all Risk level 2 & 3, and LUP Type 2 & 3 sites. Numeric action levels are essentially numeric benchmark values for certain parameters that, if exceeded in effluent sampling, trigger the discharger to take actions. Exceedance of an NAL does not itself constitute a violation of the General Permit. If the discharger fails to take the corrective action required by the General Permit, though, that may consititute a violation.

The primary purpose of NALs is to assist dischargers in evaluating the effectiveness of their on-site measures. Construction sites need to employ many different systems that must work together to achieve compliance with the permit's requirements. The NALs chosen should indicate whether the systems are working as intended.

Another purpose of NALs is to provide information regarding construction activities and water quality impacts. This data will provide the State and Regional Water Boards and the rest of the storm water community with more information about levels and types of pollutants present in runoff and how effective the dischargers BMPs are at reducing pollutants in effluent. The State Water Board also hopes to learn more about the linkage between effluent and receiving water quality. In addition, these requirements will provide information on the mechanics needed to establish compliance monitoring programs at construction sites in future permit deliberations.

i. *pH*

The chosen limits were established by calculating one standard deviation above and below the mean pH of runoff from highway construction sites[10] in California. Proper implementation of BMPs should result in discharges that are within the range of 6.5 to 8.5 pH Units.

---

[9] http://www.waterboards.ca.gov/tmdl/tmdl.html.
[10] Caltrans Construction Sites Runoff Characterization Study, 2002. Available at: http://www.dot.ca.gov/hq/env/stormwater/pdf/CTSW-RT-02-055.pdf.

The Caltrans study included 33 highway construction sites throughout California over a period of four years, which included 120 storm events. All of these sites had BMPs in place that would be generally implemented at all types of construction sites in California.

ii. ***Turbidity***

BPJ was used to develop an NAL that can be used as a learning tool to help dischargers improve their site controls, and to provide meaningful information on the effectiveness of storm water controls. A statewide turbidity NAL has been set at 250 NTU.

G. Receiving Water Limitations

Construction-related activities that cause or contribute to an exceedance of water quality standards must be addressed. The dynamic nature of construction activity gives the discharger the ability to quickly identify and monitor the source of the exceedances. This is because when storm water mobilizes sediment, it provides visual cues as to where corrective actions should take place and how effective they are once implemented.

This General Permit requires that storm water discharges and authorized non-storm water discharges must not contain pollutants that cause or contribute to an exceedance of any applicable water quality objective or water quality standards. The monitoring requirements in this General Permit for sampling and analysis procedures will help determine whether BMPs installed and maintained are preventing pollutants in discharges from the construction site that may cause or contribute to an exceedance of water quality standards.

Water quality standards consist of designated beneficial uses of surface waters and the adoption of ambient criteria necessary to protect those uses. When adopted by the State Water Board or a Regional Water Board, the ambient criteria are termed "water quality objectives." If storm water runoff from construction sites contains pollutants, there is a risk that those pollutants could enter surface waters and cause or contribute to an exceedance of water quality standards. For that reason, dischargers should be aware of the applicable water quality standards in their receiving waters. (The best method to ensure compliance with receiving water limitations is to implement BMPs that prevent pollutants from contact with storm water or from leaving the construction site in runoff.)

In California, water quality standards are published in the Basin Plans adopted by each Regional Water Board, the California Toxics Rule (CTR), the National Toxics Rule (NTR), and the Ocean Plan.

Dischargers can determine the applicable water quality standards by contacting Regional Water Board staff or by consulting one of the following sources. The actual Basin Plans that contain the water quality standards can be viewed at the website of the appropriate Regional Water Board. (http://www.waterboards.ca.gov/regions.html), the State Water Board site for statewide plans (http://www.waterboards.ca.gov/plnspols/index.html), or the USEPA regulations for the NTR and CTR (40 C.F.R. §§ 131.36-38). Basin Plans and statewide plans are also available by mail from the appropriate Regional Water Board or the State Water Board. The USEPA regulations are available at http://www.epa.gov/. Additional information concerning water quality standards can be accessed through http://www.waterboards.ca.gov/stormwtr/gen_const.html.

H. Training Qualifications and Requirements

The Blue Ribbon Panel (BRP) made the following observation about the lack of industry-specific training requirements:

"Currently, there is no required training or certification program for contractors, preparers of soil erosion and sediment control Storm Water Pollution Prevention Plans, or field inspectors."

Order 99-08-DWQ required that all dischargers train their employees on how to comply with the permit, but it did not specificy a curriculum or certification program. This has resulted in inconsistent implementation by all affected parties - the dischargers, the local governments where the construction activity occurs, and the regulators required to enforce 99-08-DWQ. This General Permit requires Qualified SWPPP Developers and practitioners to obtain appropriate training, and makes this curriculum mandatory two years after adoption, to allow time for course completion. The State and Regional Water Board are working with many stakeholders to develop the curriculum and mechanisms needed to develop and deliver the courses.

To ensure that the preparation, implementation, and oversight of the SWPPP is sufficient for effective pollution prevention, the Qualified SWPPP Developer and Qualified SWPPP Practitioners responsible for creating, revising, overseeing, and implementing the SWPPP must attend a State Water Board-sponsored or approved Qualified SWPPP Developer and Qualified SWPPP Practitioner training course.

I. Sampling, Monitoring, Reporting and Record Keeping

1. Traditional Construction Monitoring Requirements

This General Permit requires visual monitoring at all sites, and effluent water quality at all Risk Level 2 & 3 sites. It requires receiving water monitoring at some Risk Level 3 sites. All sites are required to submit annual reports, which contain various types of information, depending on the site characteristics and events. A summary of the monitoring and reporting requirements is found in Table 4.

Table 4 - Required Monitoring Elements for Risk Levels

	Visual	Non-visible Pollutant	Effluent	Receiving Water
Risk Level 1	three types required for all Risk Levels: non-storm water, pre-rain and post-rain	As needed for all Risk Levels (see below)	where applicable	not required
Risk Level 2			pH, turbidity	not required
Risk Level 3			pH, turbidity	(if Receiving Water Monitoring Trigger exceeded) pH, turbidity and SSC. Bioassessment for sites 30 acres or larger.

a. Visual

All dischargers are required to conduct quarterly, non-storm water visual inspections. For these inspections, the discharger must visually observe each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources. For storm-related inspections, dischargers must visually observe storm water discharges at all discharge locations within two business days after a qualifying event. For this requirement, a qualifying rain event is one producing precipitation of ½ inch or more of discharge. Dischargers must conduct a post-storm event inspection to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify any additional BMPs necessary and revise the SWPPP accordingly. Dischargers must maintain on-site records of all visual observations, personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

b. Non-Visible Pollutant Monitoring

This General Permit requires that all dischargers develop a sampling and analysis strategy for monitoring pollutants that are not visually detectable in storm water. Monitoring for non-visible pollutants must be required at any construction site when the exposure of construction materials occurs and where a discharge can cause or contribute to an exceedance of a water quality objective.

Of significant concern for construction discharges are the pollutants found in materials used in large quantities at construction sites throughout California and exposed throughout the rainy season, such as cement, flyash, and other recycled materials or by-products of combustion. The water quality standards that apply to these materials will depend on their composition. Some of the more common storm water pollutants from construction activity are not CTR pollutants. Examples of non-visible pollutants include glyphosate (herbicides), diazinon and chlorpyrifos (pesticides), nutrients (fertilizers), and molybdenum (lubricants). The use of diazinon and chlorpyrifos is a common practice among landscaping professionals and may trigger sampling and analysis requirements if these materials come into contact with storm water. High pH values from cement and gypsum, high pH and SSC from wash waters, and chemical/fecal contamination from portable toilets, also are not CTR pollutants. Although some of these constituents do have numeric water quality objectives in individual Basin Plans, many do not and are subject only to narrative water quality standards (i.e. not causing toxicity). Dischargers are encouraged to discuss these issues with Regional Water Board staff and other storm water quality professionals.

The most effective way to avoid the sampling and analysis requirements, and to ensure permit compliance, is to avoid the exposure of construction materials to precipitation and storm water runoff. Materials that are not exposed do not have the potential to enter storm water runoff, and therefore receiving waters sampling is not required. Preventing contact between storm water and construction materials is one of the most important BMPs at any construction site.

Preventing or eliminating the exposure of pollutants at construction sites is not always possible. Some materials, such as soil amendments, are designed to be used in a manner that will result in exposure to storm water. In these cases, it is important to make sure that these materials are applied according to the manufacturer's instructions and at a time when they are unlikely to be washed away. Other construction materials can be exposed when storage, waste disposal or the application of the material is done in a manner not protective of water quality. For these situations, sampling is required unless there is capture and containment of all storm water that has been exposed. In cases where construction materials may be exposed to storm water, but the storm water is contained and is not allowed to run off the site, sampling will only be required when inspections show that the containment failed or is breached, resulting in potential exposure or discharge to receiving waters.

The discharger must develop a list of potential pollutants based on a review of potential sources, which will include construction materials soil amendments, soil treatments, and historic contamination at the site. The discharger must review existing environmental and real estate documentation to determine the potential for pollutants that could be present on the construction site as a result of past land use activities.

Good sources of information on previously existing pollution and past land uses include:

i. Environmental Assessments;

ii. Initial Studies;

iii. Phase 1 Assessments prepared for property transfers; and

iv. Environmental Impact Reports or Environmental Impact Statements prepared under the requirements of the National Environmental Policy Act or the California Environmental Quality Act.

In some instances, the results of soil chemical analyses may be available and can provide additional information on potential contamination.

The potential pollutant list must include all non-visible pollutants that are known or should be known to occur on the construction site including, but not limited to, materials that:

i. are being used in construction activities;

ii. are stored on the construction site;

iii. were spilled during construction operations and not cleaned up;

iv. were stored (or used) in a manner that created the potential for a release of the materials during past land use activities;

v. were spilled during previous land use activities and not cleaned up; or

vi. were applied to the soil as part of past land use activities.

C. Effluent Monitoring

Federal regulations[11] require effluent monitoring for discharges subject to NALs. Subsequently, all Risk Level 2 and 3 dischargers must perform sampling and analysis of effluent discharges to characterize discharges associated with construction activity from the entire area disturbed by the project. Dischargers must collect samples of stored or contained storm water that is discharged subsequent to a storm event producing precipitation of ½ inch or more at the time of discharge.

Table 5 - Storm Water Effluent Monitoring Requirements by Risk Level

	Frequency	Effluent Monitoring (Section E, below)
Risk Level 1	when applicable	non-visible pollutant parameters (if applicable)
Risk Level 2	Minimum of 3 samples per day during qualifying rain event characterizing discharges associated with construction activity from the entire project disturbed area.	pH, turbidity, and non-visible pollutant parameters (if applicable)
Risk Level 3	Minimum of 3 samples per day during qualifying rain event characterizing discharges associated with construction activity from the entire project disturbed area.	pH, turbidity, and non-visible pollutant parameters if applicable

Risk Level 1 dischargers must analyze samples for:

i. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment C contained in the General Permit.

[11] 40 C.F.R. § 122.44.

Risk Level 2 dischargers must analyze samples for:

i. pH and turbidity;

ii. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment D contained in the General Permit, and

iii. any additional parameters for which monitoring is required by the Regional Water Board.

Risk Level 3 dischargers must analyze samples for:

i. pH, turbidity;

ii. any parameters indicating the presence of pollutants identified in the pollutant source assessment required in Attachment E contained in the General Permit, and

iii. any additional parameters for which monitoring is required by the Regional Water Board.

2. Linear Monitoring and Sampling Requirements

Attachment A, establishes minimum monitoring and reporting requirements for all LUPs. It establishes different monitoring requirements depending on project complexity and risk to water quality. The monitoring requirements for Type 1 LUPs are less than Type 2 & 3 projects because Type 1 projects have a lower potential to impact water quality.

A discharger shall prepare a monitoring program prior to the start of construction and immediately implement the program at the start of construction for LUPs. The monitoring program must be implemented at the appropriate level to protect water quality at all times throughout the life of the project.

a. Type 1 LUP Monitoring Requirements

A discharger must conduct daily visual inspections of Type 1 LUPs during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be conducted in conjunction with other daily activities. Inspections will be conducted to ensure the BMPs are adequate, maintained, and in place at the end of the construction day. The discharger will revise the SWPPP, as appropriate, based on the results of the daily inspections. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures have been installed, and successful final vegetative cover or other stabilization criteria have been met).

A discharger shall implement the monitoring program for inspecting Type 1 LUPs. This program requires temporary and permanent stabilization BMPs after active construction is completed. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where re-vegetation is chosen until minimum vegetative coverage has been established. Photographs shall be taken during site inspections and submitted to the State Water Board.

b. Type 2 & 3 LUP Monitoring Requirements

A discharger must conduct daily visual inspections of Type 2 & 3 LUPs during working hours while construction activities are occurring. Inspections are to be conducted by qualified personnel and can be in conjunction with other daily activities.

All dischargers of Type 2 & 3 LUPs are required to conduct inspections by qualified personnel of the construction site during normal working hours prior to all anticipated storm events and after actual storm events. During extended storm events, the discharger shall conduct inspections during normal working hours for each 24-hour period. Inspections can be discontinued in non-active construction areas where soil disturbing activities have been completed and final stabilization has been achieved (e.g., trench has been paved, substructures installed, and successful vegetative cover or other stabilization criteria have been met).

The goals of these inspections are (1) to identify areas contributing to a storm water discharge; (2) to evaluate whether measures to reduce pollutant loadings identified in the SWPPP are adequate and properly installed and functioning in accordance with the terms of the General Permit; and (3) to determine whether additional control practices or corrective maintenance activities are needed. Equipment, materials, and workers must be available for rapid response to failures and emergencies. All corrective maintenance to BMPs shall be performed as soon as possible, depending upon worker safety.

All dischargers shall develop and implement a monitoring program for inspecting Type 2 & 3 LUPs that require temporary and permanent stabilization BMPs after active construction is completed. Inspections will be conducted to ensure the BMPs are adequate and maintained. Inspection activities will continue until adequate permanent stabilization has been established and will continue in areas where revegetation is chosen until minimum vegetative coverage has been established.

A log of inspections conducted before, during, and after the storm events must be maintained in the SWPPP. The log will provide the date and time of the inspection and who conducted the inspection. Photographs must be taken during site inspections and submitted to the State Water Board.

C. Sampling Requirements for all LUP Project Types

LUPs are also subject to sampling and analysis requirements for visible pollutants (i.e., sedimentation/siltation, turbidity) and for non-visible pollutants.

Sampling for visible pollutants is required for Type 2 & 3 LUPs.

Non-visible pollutant monitoring is required for pollutants associated with construction sites and activities that (1) are not visually detectable in storm water discharges, and (2) are known or should be known to occur on the construction site, and (3) could cause or contribute to an exceedance of water quality objectives in the receiving waters. Sample collection for non-visible pollutants must only be required (1) during a storm event when pollutants associated with construction activities may be discharged with storm water runoff due to a spill, or in the event there was a breach, malfunction, failure, and/or leak of any BMP, and (2) when the discharger has failed to adequately clean the area of material and pollutants. Failure to implement appropriate BMPs will trigger the same sampling requirements as those required for a breach, malfunction and/or leak, or when the discharger has failed to implement appropriate BMPs prior to the next storm event.

Additional monitoring parameters may be required by the Regional Water Boards.

It is not anticipated that many LUPs will be required to collect samples for pollutants not visually detected in runoff due to the nature and character of the construction site and activities as previously described in this fact sheet. Most LUPs are constructed in urban areas with public access (e.g., existing roadways, road shoulders, parking areas, etc.). This raises a concern regarding the potential contribution of pollutants from vehicle use and/or from normal activities of the public (e.g., vehicle washing, landscape fertilization, pest spraying, etc.) in runoff from the project site. Since the dischargers are not the land owners of the project area and are not able to control the presence of these pollutants in the storm water that runs through their projects, it is not the intent of this General Permit to require dischargers to sample for these pollutants. This General Permit does not require the discharger to sample for these types of pollutants except where the discharger has brought materials onsite that contain these pollutants and when a condition (e.g., breach, failure, etc.) described above occurs.

3. Receiving Water Monitoring

In order to ensure that receiving water limitations are met, discharges subject to receiving water monitoring triggers (i.e., Risk Level 3 and LUP Type 3 sites) or numeric effluent limitations (i.e., Risk Level 3 and LUP Type 3 sites utilizing ATS with direct discharges into receiving waters) must also monitor the downstream receiving water(s) for turbidity, SSC, and pH (if applicable) when a receiving water monitoring trigger or NEL is exceeded.

a. Bioassessment Monitoring

This General Permit requires a bioassessment of receiving waters for dischargers of Risk Level 3 or LUP Type 3 construction projects equal to or larger than 30 acres with direct discharges into receiving waters. Benthic macroinvertebrate samples will be taken upstream and downstream of the site's discharge point in the receiving water. Bioassessments measure the quality of the stream by analyzing the aquatic life present. Higher levels of appropriate aquatic species tend to indicate a healthy stream; whereas low levels of organisms can indicate stream degradation. Active construction sites have the potential to discharge large amounts of sediment and pollutants into receiving waters. Requiring a bioassessment for large project sites, with the most potential to impact water quality, provides a snapshot of the health of the receiving water prior to initiation of construction activities. This snapshot can be used in comparison to the health of the receiving water after construction has commenced.

Each ecoregion (biologically and geographically related area) in the State has a specific yearly peak time where stream biota is in a stable and abundant state. This time of year is called an Index Period. The bioassessment requirements in this General Permit, requires benthic macroinvertebrate sampling within a sites index period. The State Water Board has developed a map designating index periods for the ecoregions in the State (see State Water Board Website).

This General Permit requires the bioassessment methods to be in accordance with the Surface Water Ambient Monitoring Program (SWAMP) in order to provide data consistency within the state as well as generate useable biological stream data.

Table 6 - Receiving Water Monitoring Requirements

	Receiving Water Monitoring Parameters
Risk Level 1 /LUP Type 1	not required
Risk Level 2 / LUP Type 2	not required
Risk Level 3 / LUP Type 3	If Receiving Water Monitoring Trigger exceeded: pH (if applicable), turbidity, and SSC. Bioassessment for sites 30 acres or larger.

4. Reporting Requirements

a. NAL Exceedance Report

All Risk Level 3 and LUP Type 3 dischargers must electronically submit all storm event sampling results to the State And Regional Boards, via the electronic data system, no later than 10 days after the conclusion of the storm event.

b. Annual Report

All dischargers must prepare and electronically submit an annual report no later than September 1 of each year using the Storm water Multi-Application Reporting and Tracking System (SMARTS). The

Annual Report must include a summary and evaluation of all sampling and analysis results, original laboratory reports, chain of custody forms, a summary of all corrective actions taken during the compliance year, and identification of any compliance activities or corrective actions that were not implemented.

5. Record Keeping

According to 40 C.F.R. Parts 122.21(p) and 122.41(j), the discharger is required to retain paper or electronic copies of all records required by this General Permit for a period of at least three years from the date generated or the date submitted to the State Water Board or Regional Water Boards. A discharger must retain records for a period beyond three years as directed by Regional Water Board.

J. Risk Determination

1. Traditional Projects

a. Overall Risk Determination

There are two major requirements related to site planning and risk determination in this General Permit. The project's overall risk is broken up into two elements – (1) project sediment risk (the relative amount of sediment that can be discharged, given the project and location details) and (2) receiving water risk (the risk sediment discharges pose to the receiving waters).

Project Sediment Risk:
Project Sediment Risk is determined by multiplying the R, K, and LS factors from the Revised Universal Soil Loss Equation (RUSLE) to obtain an estimate of project-related bare ground soil loss expressed in tons/acre. The RUSLE equation is as follows:

A = (R)(K)(LS)(C)(P)

Where: A = the rate of sheet and rill erosion
R = rainfall-runoff erosivity factor
K = soil erodibility factor
LS = length-slope factor
C = cover factor (erosion controls)
P = management operations and support practices (sediment controls)

The C and P factors are given values of 1.0 to simulate bare ground conditions.

There is a map option and a manual calculation option for determining soil loss. For the map option, the R factor for the project is calculated using the online calculator at http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm. The product of K and LS are shown on Figure 1. To determine soil loss in tons per acre, the discharger multiplies the R factor times the value for K times LS from the map.

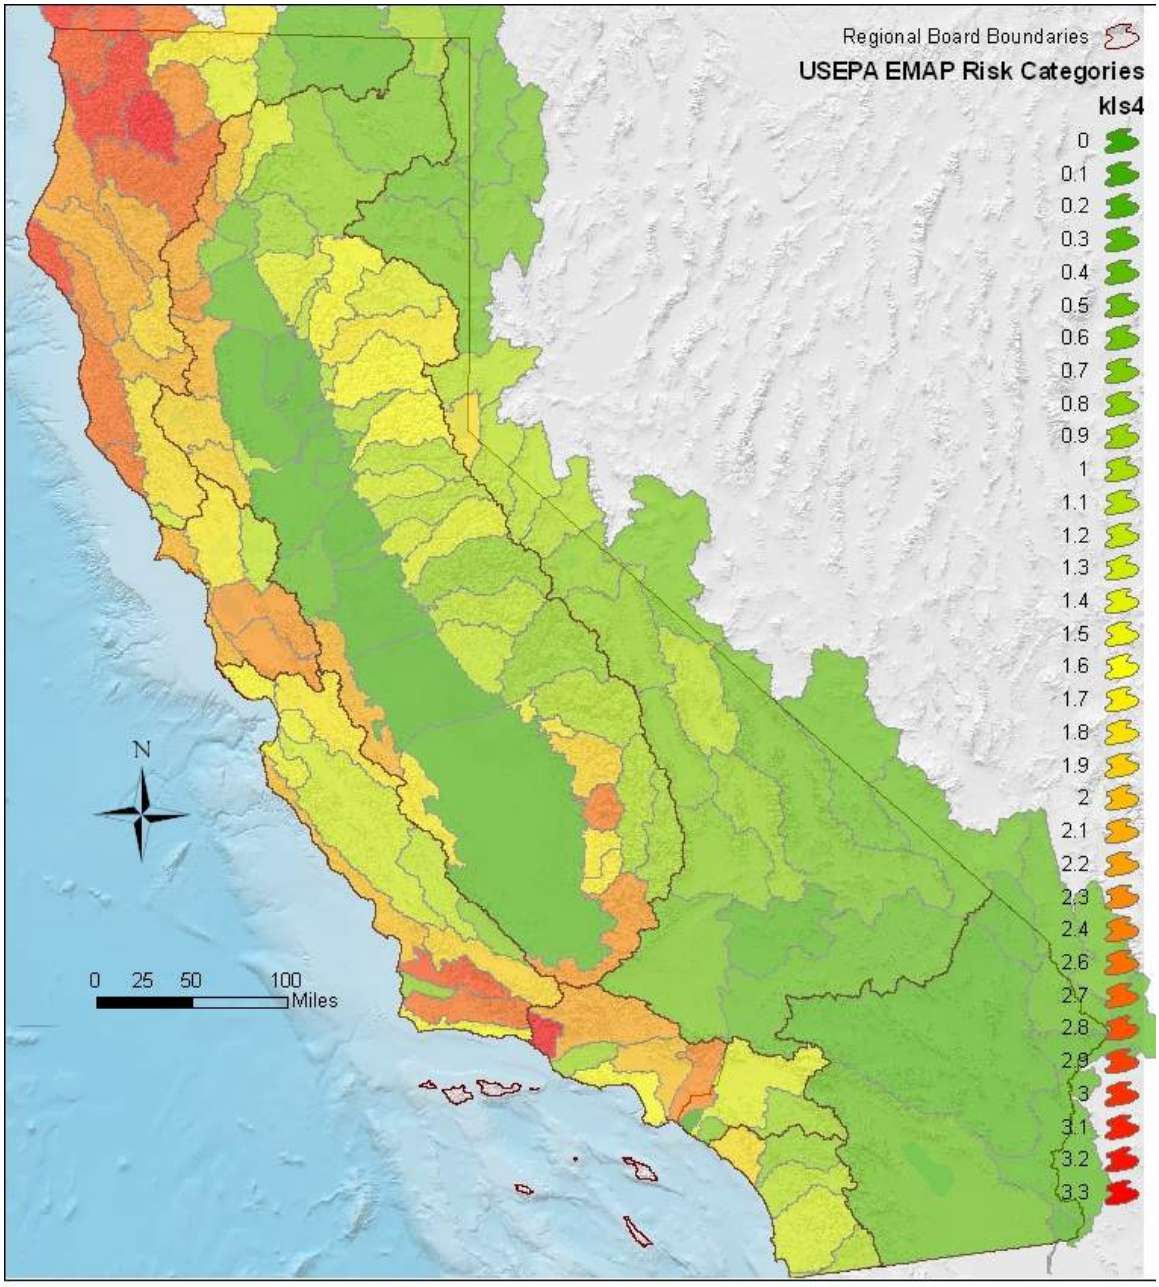

Figure 1 -Statewide Map of K * LS

For the manual calculation option, the R factor for the project is calculated using the online calculator at http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm. The K and LS factors are determined using Appendix 1.

Soil loss of less than 15 tons/acre is considered **low** sediment risk.
Soil loss between 15 and 75 tons/acre is **medium** sediment risk.
Soil loss over 75 tons/acre is considered **high** sediment risk.

The soil loss values and risk categories were obtained from mean and standard deviation RKLS values from the USEPA EMAP program. High risk is the mean RKLS value plus two standard deviations. Low risk is the mean RKLS value minus two standard deviations.

Receiving Water Risk:
Receiving water risk is based on whether a project drains to a sediment-sensitive waterbody. A sediment-sensitive waterbody is either

on the most recent 303d list for waterbodies impaired for sediment;
has a USEPA-approved Total Maximum Daily Load implementation plan for sediment; **or**
has the beneficial uses of COLD, SPAWN, and MIGRATORY.

A project that meets at least one of the three criteria has a high receiving water risk. A list of sediment-sensitive waterbodies will be posted on the State Water Board's website. It is anticipated that an interactive map of sediment sensitive water bodies in California will be available in the future.

The Risk Levels have been altered by eliminating the possibility of a Risk Level 4, and expanding the constraints for Risk Levels 1, 2, and 3. Therefore, projects with high receiving water risk and high sediment risk will be considered a Risk Level 3 risk to water quality.

In response to public comments, the Risk Level requirements have also been changed such that Risk Level 1 projects will be subject to minimum BMP and visual monitoring requirements, Risk Level 2 projects will be subject to NALs and some additional monitoring requirements, and Risk Level 3 projects will be subject to NALs, and more rigorous monitoring requirements such as receiving water monitoring and in some cases bioassessment.

Table 7 - Combined Risk Level Matrix

Combined Risk Level Matrix				
Receiving Water Risk		Sediment Risk		
		Low	Medium	High
	Low	Level 1	Level 2	
	High	Level 2		Level 3

b. **Effluent Standards**

All dischargers are subject to the narrative effluent limitations specified in the General Permit. The narrative effluent limitations require storm water discharges associated with construction activity to meet all applicable provisions of Sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize BAT and BCT to reduce pollutants and any more stringent controls necessary to meet water quality standards.

Risk Level 2 dischargers that pose a medium risk to water quality are subject to technology-based NALs for pH and turbidity. Risk Level 3 dischargers that pose a high risk to water quality are also subject to technology-based NALs for pH and turbidity.

c. Good Housekeeping

Proper handling and managing of construction materials can help minimize threats to water quality. The discharger must consider good housekeeping measures for: construction materials, waste management, vehicle storage & maintenance, landscape materials, and potential pollutant sources. Examples include; conducting an inventory of products used, implementing proper storage & containment, and properly cleaning all leaks from equipment and vehicles.

d. Non-Storm Water Management

Non-storm water discharges directly connected to receiving waters or the storm drain system have the potential to negatively impact water quality. The discharger must implement measures to control all non-storm water discharges during construction, and from dewatering activities associated with construction. Examples include; properly washing vehicles in contained areas, cleaning streets, and minimizing irrigation runoff.

e. Erosion Control

The best way to minimize the risk of creating erosion and sedimentation problems during construction is to disturb as little of the land surface as possible by fitting the development to the terrain. When development is tailored to the natural contours of the land, little grading is necessary and, consequently, erosion potential is lower.[14] Other effective erosion control measures include: preserving existing vegetation where feasible, limiting disturbance, and stabilizing and re-vegetating disturbed areas as soon as possible after grading or construction activities. Particular attention must be paid to large, mass-graded sites where the potential for soil exposure to the erosive effects of rainfall and wind is great and where there is potential for significant sediment discharge from the site to surface waters. Until permanent vegetation is established, soil cover is the most cost-effective and expeditious method to protect soil particles from detachment and transport by rainfall. Temporary soil stabilization can be the single most important factor in reducing erosion at construction sites. The discharger is required to consider measures such as: covering disturbed areas with mulch, temporary seeding, soil stabilizers, binders, fiber rolls or blankets, temporary vegetation, and permanent seeding. These erosion control measures are only examples of what should be considered and should not preclude new or innovative approaches currently available or being developed. Erosion control BMPs should be the primary means of preventing storm water contamination, and sediment control techniques should be used to capture any soil that becomes eroded.[12]

Risk Level 3 dischargers pose a higher risk to water quality and are therefore additionally required to ensure that post-construction soil loss is equivalent to or less than the pre-construction levels.

f. Sediment Control

Sediment control BMPs should be the secondary means of preventing storm water contamination. When erosion control techniques are ineffective, sediment control techniques should be used to capture any soil that becomes eroded. The discharger is required to consider perimeter control measures such as: installing silt fences or placing straw wattles below slopes. These sediment control measures are only

---

[12] U.S. Environmental Protection Agency. 2007. Developing Your Storm Water Pollution Prevention Plan: A Guide for Construction Sites.

examples of what should be considered and should not preclude new or innovative approaches currently available or being developed.

Because Risk Level 2 and 3 dischargers pose a higher risk to water quality, additional requirements for the application of sediment controls are imposed on these projects. This General Permit also authorizes the Regional Water Boards to require Risk Level 3 dischargers to implement additional site-specific sediment control requirements if the implementation of other erosion or sediment controls are not adequately protecting the receiving waters.

g. Run-on and Runoff Control

Inappropriate management of run-on and runoff can result in excessive physical impacts to receiving waters from sediment and increased flows. The discharger is required to manage all run-on and runoff from a project site. Examples include: installing berms and other temporary run-on and runoff diversions.

Risk Level 1 dischargers with lower risks to impact water quality are not subject to the run-on and runoff control requirements unless an evaluation deems them necessary or visual inspections show that such controls are required.

h. Inspection, Maintenance and Repair

All measures must be periodically inspected, maintained and repaired to ensure that receiving water quality is protected. Frequent inspections coupled with thorough documentation and timely repair is necessary to ensure that all measures are functioning as intended.

i. Rain Event Action Plan (REAP)

A Rain Event Action Plan (REAP) is a written document, specific for each rain event. A REAP should be designed that when implemented it protects all exposed portions of the site within 48 hours of any likely precipitation event forecast of 50% or greater probability.

This General Permit requires Risk Level 2 and 3 dischargers to develop and implement a REAP designed to protect all exposed portions of their sites within 48 hours prior to any likely precipitation event. The REAP requirement is designed to ensure that the discharger has adequate materials, staff, and time to implement erosion and sediment control measures that are intended to reduce the amount of sediment and other pollutants generated from the active site. A REAP must be developed when there is likely a forecast of 50% or greater probability of precipitation in the project area. (The National Oceanic and Atmospheric Administration (NOAA) defines a chance of precipitation as a probability of precipitation of 30% to 50% chance of producing precipitation in the project area.[13] NOAA defines the probability of precipitation (PoP) as the likelihood of occurrence (expressed as a percent) of a measurable amount (0.01 inch or more) of liquid precipitation (or the water equivalent of frozen precipitation) during a specified period of time at any given point in the forecast area.) Forecasts are normally issued for 12-hour time periods. Descriptive terms for uncertainty and aerial coverage are used as follows:

Table 8 -National Oceanic and Atmospheric Administration (NOAA) Definition of Probability of Precipitation (PoP)

[13] http://www.crh.noaa.gov/lot/severe/wxterms.php.

PoP	Expressions of Uncertainty	Aerial Coverage
0%	none used	none used
10%	none used	isolated
20%	slight chance	isolated
30-50%	chance	scattered
60-70%	likely	numerous
80-100%	none used	none used

The discharger must obtain the precipitation forecast information from the National Weather Service Forecast Office (http://www.srh.noaa.gov/).

2. **Linear Projects**

a. **Linear Risk Determination**

LUPs vary in complexity and water quality concerns based on the type of project. This General Permit has varying application requirements based on the project's risk to water quality. Factors that lead to the characterization of the project include location, sediment risk, and receiving water risk.

Based on the location and complexity of a project area or project section area, LUPs are separated into project types. As described below, LUPs have been categorized into three project types.

i. ***Type 1 LUPs***

Type 1 LUPs are those construction projects where:

(1) 70 percent or more of the construction activity occurs on a paved surface and where areas disturbed during construction will be returned to preconstruction conditions or equivalent protection established at the end of the construction activities for the day, or

(2) greater than 30 percent of construction activities occur within the non-paved shoulders or land immediately adjacent to paved surfaces, or where construction occurs on unpaved improved roads, including their shoulders or land immediately adjacent to them where:

Areas disturbed during construction will be returned to pre-construction conditions or equivalent protection established at the end of the construction activities for the day to minimize the potential for erosion and sediment deposition, and

Areas where established vegetation was disturbed during construction will be stabilized and re-vegetated by the end of project. When required, adequate temporary stabilization Best Management Practices (BMPs) will be installed and maintained until vegetation is established to meet minimum cover requirements established in this General Permit for final stabilization.

Type 1 LUPs typically do not have a high potential to impact storm water quality because (1) these construction activities are not typically conducted during a rain event, (2) these projects are normally constructed over a short period of time[14], minimizing the duration that pollutants could potentially be exposed to rainfall; and (3) disturbed soils such as those from trench excavation are required to be hauled away, backfilled into the trench, and/or covered (e.g., metal plates, pavement, plastic covers over spoil piles) at the end of the construction day.

Type 1 LUPs are determined during the risk assessment found in Attachment A.1 to be 1) low sediment risk and low receiving water risk; 2) low sediment risk and medium receiving water risk; and 3) medium sediment risk and low receiving water risk.

This General Permit requires the discharger to ensure a SWPPP is developed for these construction activities that is specific to project type, location and characteristics.

ii. ***Type 2 LUPs:***

Type 2 projects are determined to have a combination of High, Medium, and Low project sediment risk along with High, Medium, and Low receiving water risk. Like Type 1 projects, Type 2 projects are typically constructed over a short period of time. However, these projects have a higher potential to impact water quality because they:

(1) typically occur outside the more urban/developed areas;

(2) have larger areas of soil disturbance that are not closed or restored at the end of the day;

(3) may have onsite stockpiles of soil, spoil and other materials;

(4) cross or occur in close proximity to a wide variety of sensitive resources that may include, but are not limited to, steep topography and/or water bodies; and

(5) have larger areas of disturbed soils that may be exposed for a longer time interval before final stabilization, cleanup and/or reclamation occurs.

This General Permit requires the discharger to develop and implement a SWPPP for these construction activities that are specific for project type, location and characteristics.

iii. ***Type 3 LUPs:***

[14] Short period of time refers to a project duration of weeks to months, but typically less than one year in duration.

Type 3 projects are determined to have a combination of High and Medium project sediment risk along with High and Medium receiving water risk. Similar to Type 2 projects, Type 3 projects have a higher potential to impact water quality because they:

(1) typically occur outside of the more urban/developed areas;

(2) have larger areas of soil disturbance that are not closed or restored at the end of the day;

(3) may have onsite stockpiles of soil, spoil and other materials;

(4) cross or occur in close proximity to a wide variety of sensitive resources that may include, but are not limited to, steep topography and/or water bodies; and

(5) have larger areas of disturbed soils that may be exposed for a longer time interval before final stabilization, cleanup and/or reclamation occurs.

This General Permit requires the discharger to develop and implement a SWPPP for these construction activities that are specific for project type, location, and characteristics.

b. Linear Effluent Standards

All LUPs are subject to the narrative effluent limitations specified in the General Permit.

Type 2 and Type 3 projects are subject to technology-based NALs for pH and turbidity.

c. Linear Good Housekeeping

Improper use and handling of construction materials could potentially cause a threat to water quality. In order to ensure proper site management of these construction materials, all LUP dischargers must comply with a minimum set of Good Housekeeping measures specified in Attachment A of this General Permit.

d. Linear Non-Storm Water Management

In order to ensure control of all non-storm water discharges during construction, all LUP dischargers must comply with the Non-Storm Water Management measures specified in Attachment A of this General Permit.

e. Linear Erosion Control

This General Permit requires all LUP dischargers to implement effective wind erosion control measures, and soil cover for inactive areas. Type 3 LUPs posing a higher risk to water quality are additionally required to ensure the post-construction soil loss is equivalent to or less than the pre-construction levels.

f. Linear Sediment Control

In order to ensure control and containment of all sediment discharges, all LUP dischargers must comply with the general Sediment Control measures specified in Attachment A or this General Permit. Additional requirements for sediment controls are imposed on Type 2 & 3 LUPs due to their higher risk to water quality.

g. Linear Run-on and Runoff Control

Discharges originating outside of a project's perimeter and flowing onto the property can adversely affect the quantity and quality of discharges originating from a project site. In order to ensure proper management of run-on and runoff, all LUPs must comply with the run-on and runoff control measures specified in Attachment A of this General Permit. Due to the lower risk of impacting water quality, Type 1 LUPs are not required to implement run-on and runoff controls unless deemed necessary by the discharger.

h. Linear Inspection, Maintenance and Repair

Proper inspection, maintenance, and repair activities are important to ensure the effectiveness of on-site measures to control water quality. In order to ensure that inspection, maintenance, and repair activities are adequately performed, the all LUP dischargers a re required to comply with the Inspection, Maintenance, and Repair requirements specified in Attachment A of this General Permit.

K. ATS[15] Requirements

There are instances on construction sites where traditional erosion and sediment controls do not effectively control accelerated erosion. Under such circumstances, or under circumstances where storm water discharges leaving the site may cause or contribute to an exceedance of a water quality standard, the use of an Active Treatment System (ATS) may be necessary. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.[16]

Although treatment systems have been in use in some form since the mid-1990s, the ATS industry in California is relatively young, and detailed regulatory standards have not yet been developed. Many developers are using these systems to treat storm water discharges from their construction sites. The new ATS requirements set forth in this General Permit are based on those in place for small wastewater treatment systems, ATS regulations from the Central Valley Regional Water Quality Control Board (September 2005 memorandum "2005/2006 Rainy Season – Monitoring Requirements for Storm Water Treatment Systems that Utilize Chemical Additives to Enhance Sedimentation"), the Construction Storm Water Program at the State of Washington's Department of Ecology, as well as recent advances in technology and knowledge of coagulant performance and aquatic safety.

The effective design of an ATS requires a detailed survey and analysis of site conditions. With proper planning, ATS performance can provide exceptional water quality discharge and prevent significant impacts to surface water quality, even under extreme environmental conditions.

These systems can be very effective in reducing the sediment in storm water runoff, but the systems that use additives/polymers to enhance sedimentation also pose a potential risk to water quality (e.g., operational failure, equipment failure, additive/polymer release, etc.). The State Water Board is concerned about the potential acute and chronic impacts that the polymers and other chemical additives may have on fish and aquatic organisms if released in sufficient quantities or concentrations. In addition

[15] An ATS is a treatment system that employs chemical coagulation, chemical flocculation, or electrocoagulation in order to reduce turbidity caused by fine suspended sediment.
[16] Pitt, R., S. Clark, and D. Lake. 2006. Construction Site Erosion and Sediment Controls: Planning, Design, and Performance. DEStech Publications. Lancaster, PA. 370pp.

to anecdotal evidence of polymer releases causing aquatic toxicity in California, the literature supports this concern.[17] For example, cationic polymers have been shown to bind with the negatively charged gills of fish, resulting in mechanical suffocation.[18] Due to the potential toxicity impacts, which may be caused by the release of additives/polymers into receiving waters, this General Permit establishes residual polymer monitoring and toxicity testing requirements have been established in this General Permit for discharges from construction sites that utilize an ATS in order to protect receiving water quality and beneficial uses.

The primary treatment process in an ATS is coagulation/flocculation. ATS's operate on the principle that the added coagulant is bound to suspended sediment, forming floc, which is gravitationally settled in tanks or a basin, or removed by sand filters. A typical installation utilizes an injection pump upstream from the clarifier tank, basin, or sand filters, which is electronically metered to both flow rate and suspended solids level of the influent, assuring a constant dose. The coagulant mixes and reacts with the influent, forming a dense floc. The floc may be removed by gravitational setting in a clarifier tank or basin, or by filtration. Water from the clarifier tank, basin, or sand filters may be routed through cartridge(s) and/or bag filters for final polishing. Vendor-specific systems use various methods of dose control, sediment/floc removal, filtration, etc., that are detailed in project-specific documentation. The particular coagulant/flocculant to be used for a given project is determined based on the water chemistry of the site because the coagulants are specific in their reactions with various types of sediments. Appropriate selection of dosage must be carefully matched to the characteristics of each site.

ATS's are operated in two differing modes, either Batch or Flow-Through. Batch treatment can be defined as Pump-Treat-Hold-Test-Release. In Batch treatment, water is held in a basin or tank, and is not discharged until treatment is complete. Batch treatment involves holding or recirculating the treated water in a holding basin or tank(s) until treatment is complete or the basin or storage tank(s) is full. In Flow-Through treatment, water is pumped into the ATS directly from the runoff collection system or storm water holding pond, where it is treated and filtered as it flows through the system, and is then directly discharged. "Flow-Through Treatment" is also referred to as "Continuous Treatment."

1. Effluent Standards

This General Permit establishes NELs for discharges from construction sites that utilize an ATS. These systems lend themselves to NELs for turbidity and pH because of their known reliable treatment. Advanced systems have been in use in some form since the mid-1990s. An ATS is considered reliable, can consistently produce a discharge of less than 10 NTU, and has been used successfully at many sites in several states since 1995 to reduce turbidity to very low levels.[19]

This General Permit contains "compliance storm event" exceptions from the technology-based NELs for ATS discharges. The rationale is that technology-based requirements are developed assuming a certain design storm. In the case of ATS the industry-standard design storm is 10-year, 24-hour (as stated in

---

[17] RomØen, K., B. Thu, and Ø. Evensen. 2002. Immersion delivery of plasmid DNA II. A study of the potentials of a chitosan based delivery system in rainbow trout (*Oncorhynchus mykiss*) fry. *Journal of Controlled Release* **85**: 215-225.

[18] Bullock, G., V. Blazer, S. Tsukuda, and S. Summerfelt. 2000. Toxicity of acidified chitosan for cultured rainbow trout (*Oncorhynchus mykiss*). *Aquaculture* **185**:273-280.

[19] Currier, B., G. Minton, R. Pitt, L. Roesner, K. Schiff, M. Stenstrom, E. Strassler, and E. Strecker. 2006. The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.

Attachment F of this General Permit), so the compliance storm event has been established as the 10-year 24-hour event as well to provide consistency.

2. **Training**

Operator training is critical to the safe and efficient operation and maintenance of the ATS, and to ensure that all State Water Board monitoring and sampling requirements are met. The General Permit requires that all ATS operators have training specific to using ATS's liquid coagulants.

L. Post-Construction Requirements

Under past practices, new and redevelopment construction activities have resulted in modified natural watershed and stream processes. This is caused by altering the terrain, modifying the vegetation and soil characteristics, introducing impervious surfaces such as pavement and buildings, increasing drainage density through pipes and channels, and altering the condition of stream channels through straightening, deepening, and armoring. These changes result in a drainage system where sediment transport capacity is increased and sediment supply is decreased. A receiving channel's response is dependent on dominant channel materials and its stage of adjustment.

Construction activity can lead to impairment of beneficial uses in two main ways. First, during the actual construction process, storm water discharges can negatively affect the chemical, biological, and physical properties of downstream receiving waters. Due to the disturbance of the landscape, the most likely pollutant is sediment, however pH and other non-visible pollutants are also of great concern. Second, after most construction activities are completed at a construction site, the finished project may result in significant modification of the site's response to precipitation. New development and redevelopment projects have almost always resulted in permanent post-construction water quality impacts because more precipitation ends up as runoff and less precipitation is intercepted, evapotranspired, and infiltrated.

General Permit 99-08-DWQ required the SWPPP to include a description of all post-construction BMPs on a site and a maintenance schedule. An effective storm water management strategy must address the full suite of storm events (water quality, channel protection, overbank flood protection, extreme flood protection) (Figure 2).

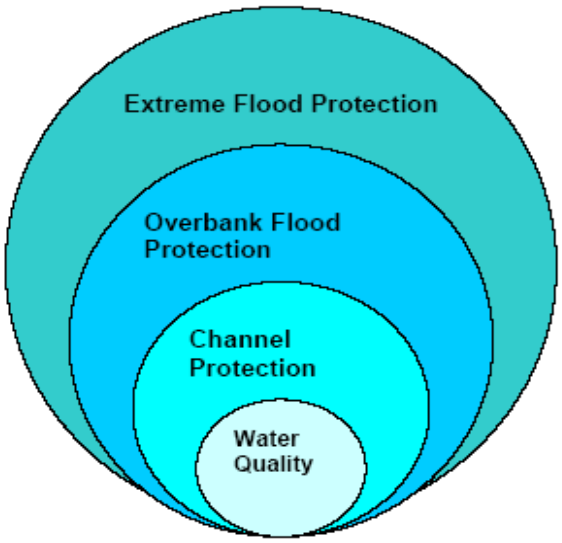

Figure 2 - Suite of Storm Events

The post-construction storm water performance standards in this General Permit specifically address water quality and channel protection events. Overbank flood protection and extreme flood protection events are traditionally dealt with in local drainage and flood protection ordinances. However, measures in this General Permit to address water quality and channel protection also reduce overbank and extreme flooding impacts. This General Permit aims to match post-construction runoff to pre-construction runoff for the 85th percentile storm event, which not only reduces the risk of impact to the receiving water's channel morphology but also provides some protection of water quality.

This General Permit clarifies that its runoff reduction requirements only apply to projects that lie outside of jurisdictions covered by a Standard Urban Storm water Management Plan (SUSMP) (or other more protective) post-construction requirements in either Phase I or Phase II permits.

Figures 3 and 4, below, show the General Permit enrollees (to Order 99-08-DWQ, as of March 10, 2008) overlaid upon a map with SUSMP (or more protective) areas in blue and purple. Areas without blue or purple indicate where the General Permit's runoff reduction requirements would actually apply.

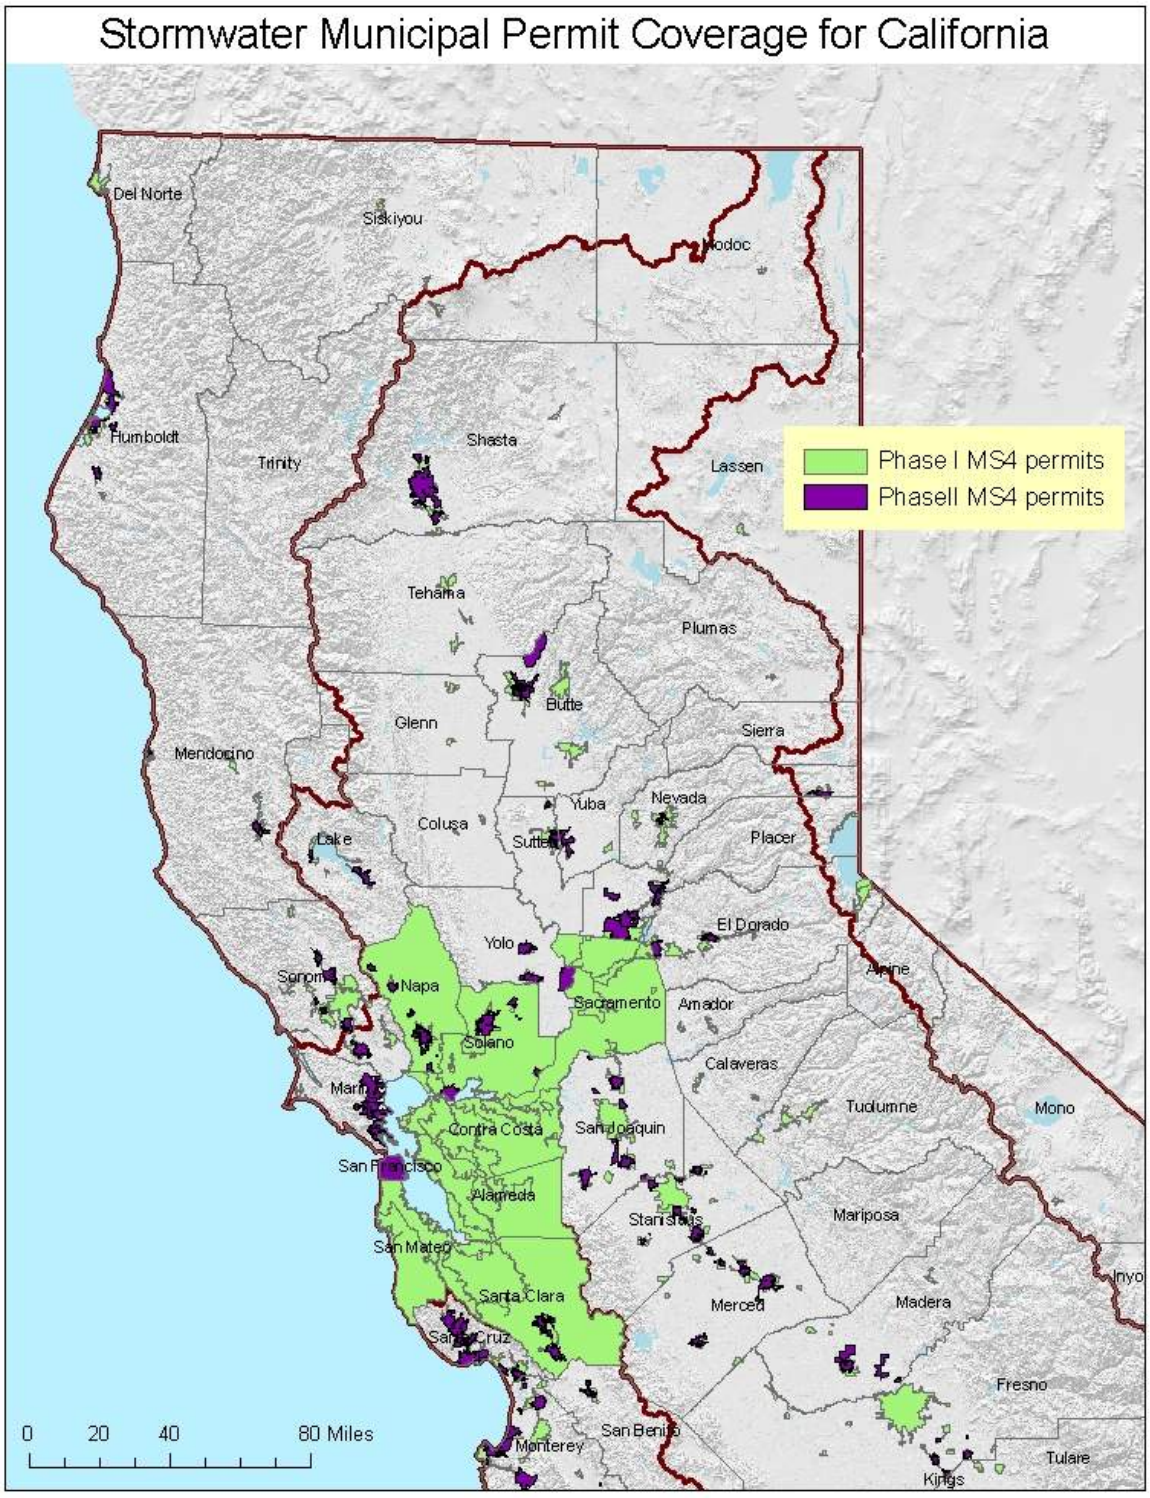

Figure 3 - Northern CA (2009) Counties / Cities With SUSMP-Plus Coverage

Stormwater Municipal Permit Coverage for California

Figure 4 - Southern CA (2009) Counties / Cities With SUSMP-Plus Coverage

Water Quality:
This General Permit requires dischargers to replicate the pre-project runoff water balance (defined as the amount of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event, or the smallest storm event that generates runoff, whichever is larger. Contemporary storm water management generally routes these flows directly to the drainage system, increasing pollutant loads and potentially causing adverse effects on receiving waters. These smaller water quality events happen much more frequently than larger events and generate much higher pollutant loads on an annual basis. There are other adverse hydrological impacts that result from not designing according to the site's pre-construction water balance. In Maryland, Klein[20] noted that baseflow decreases as the extent of urbanization increases. Ferguson and Suckling[21] noted a similar relation in watersheds in Georgia. On Long Island, Spinello and Simmons[22] noted substantial decreases in base flow in intensely urbanized watersheds.

The permit emphasizes runoff reduction through on-site storm water reuse, interception, evapo-transpiration and infiltration through non-structural controls and conservation design measures (e.g., downspout disconnection, soil quality preservation/enhancement, interceptor trees). Employing these measures close to the source of runoff generation is the easiest and most cost-effective way to comply with the pre-construction water balance standard. Using low-tech runoff reduction techniques close to the source is consistent with a number of recommendations in the literature.[23] In many cases, BMPs implemented close to the source of runoff generation cost less than end-of the pipe measures.[24] Dischargers are given the option of using Appendix 2 to calculate the required runoff volume or a watershed process-based, continuous simulation model such as the EPA's Storm Water Management Model (SWMMM) or Hydrologic Simulation Program Fortran (HSPF). Such methods used by the discharger will be reviewed by the Regional Water Board upon NOT application.

Channel Protection:
In order to address channel protection, a basic understanding of fluvial geomorphic concepts is necessary. A dominant paradigm in fluvial geomorphology holds that streams adjust their channel dimensions (width and depth) in response to long-term changes in sediment supply and bankfull discharge (1.5 to 2 year recurrence interval). The bankfull stage corresponds to the discharge at which channel maintenance is the most effective, that is, the discharge at which the moving sediment, forming or removing bars, forming or changing bends and meanders, and generally doing work that results in the average morphologic characteristics of channels.[25] Lane (1955 as cited in Rosgen 1996[26]) showed the generalized relationship between sediment load, sediment size, stream discharge and stream slope in

Figure 5. A change in any one of these variables sets up a series of mutual adjustments in the companion variables with a resulting direct change in the physical characteristics of the stream channel.

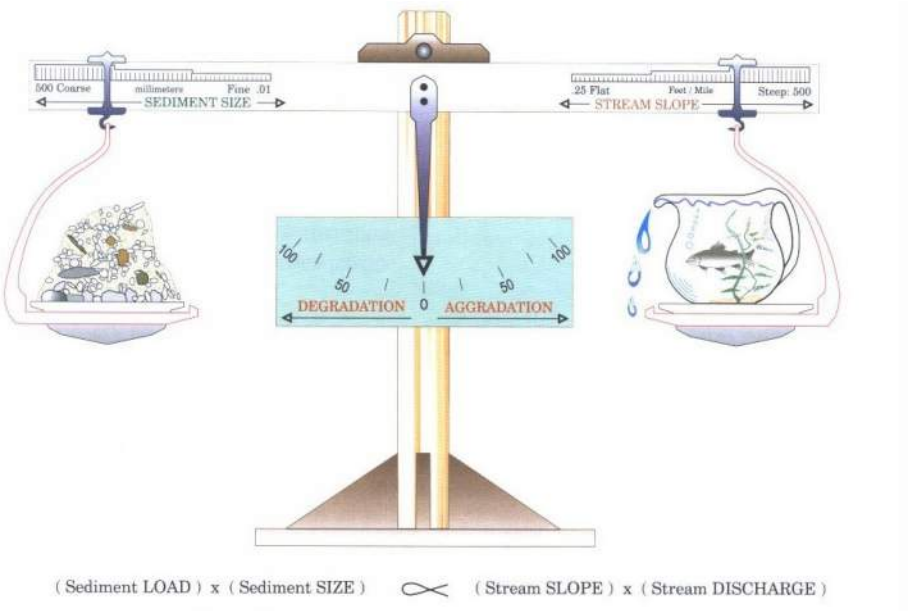

Figure 5 - Schematic of the Lane Relationship

After Lane (1955) as cited in Rosgen (1996)

Stream slope multiplied by stream discharge (the right side of the scale) is essentially an approximation of stream power, a unifying concept in fluvial geomorphology (Bledsoe 1999). Urbanization generally increases stream power and affects the resisting forces in a channel (sediment load and sediment size represented on the left side of the scale).

During construction, sediment loads can increase from 2 to 40,000 times over pre-construction levels.[27] Most of this sediment is delivered to stream channels during large, episodic rain events.[28] This increased sediment load leads to an initial aggradation phase where stream depths may decrease as sediment fills the channel, leading to a decrease in channel capacity and increase in flooding and overbank deposition. A degradation phase initiates after construction is completed.

Schumm et. al (1984) developed a channel evolution model that describes the series of adjustments from initial downcutting, to widening, to establishing new floodplains at lower elevations (Figure 6).

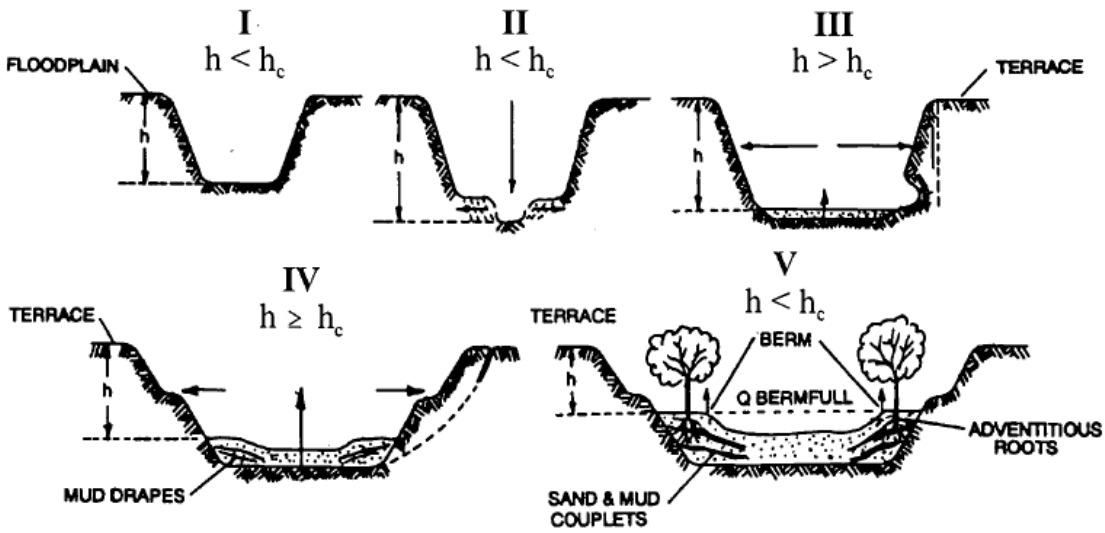

Figure 6 - Channel Changes Associated with Urbanization

After Incised Channel Evolution Sequence in Schumm et. al 1984

Channel incision (Stage II) and widening (Stages III and to a lesser degree, Stage IV) are due to a number of fundamental changes on the landscape. Connected impervious area and compaction of pervious surfaces increase the frequency and volume of bankfull discharges.[29] Increased drainage density (miles of stream length per square mile of watershed) also negatively impacts receiving stream channels.[30] Increased drainage density and hydraulic efficiency leads to an increase in the frequency and volume of bankfull discharges because the time of concentration is shortened. Flows from engineered pipes and channels are also often "sediment starved" and seek to replenish their sediment supply from the channel.

Encroachment of stream channels can also lead to an increase in stream slope, which leads to an increase in stream power. In addition, watershed sediment loads and sediment size (with size generally represented as the median bed and bank particle size, or d_{50}) decrease during urbanization.[31] This means

[29] Booth, D. B. and C. R. Jackson. 1997. Urbanization of Aquatic Systems: Degradation Thresholds, Storm Water Detection, and the Limits of Mitigation. Journal of the American Water Resources Association Vol. 33, No.5, pp. 1077-1089.

that even if pre- and post-development stream power are the same, more erosion will occur in the post-development stage because the smaller particles are less resistant (provided they are non-cohesive).

As shown in Stages II and III, the channel deepens and widens to accommodate the increased stream power [32]and decrease in sediment load and sediment size. Channels may actually narrow as entrained sediment from incision is deposited laterally in the channel. After incised channels begin to migrate laterally (Stage III), bank erosion begins, which leads to general channel widening.[33] At this point, a majority of the sediment that leaves a drainage area comes from within the channel, as opposed to the background and construction related hillslope contribution. Stage IV is characterized by more aggradation and localized bank instability. Stage V represents a new quasi-equilibrium channel morphology in balance with the new flow and sediment supply regime. In other words, stream power is in balance with sediment load and sediment size.

The magnitude of the channel morphology changes discussed above varies along a stream network as well as with the age of development, slope, geology (sand-bedded channels may cycle through the evolution sequence in a matter of decades whereas clay-dominated channels may take much longer), watershed sediment load and size, type of urbanization, and land use history. It is also dependent on a channel's stage in the channel evolution sequence when urbanization occurs. Management strategies

must take into account a channel's stage of adjustment and account for future changes in the evolution of channel form (Stein and Zaleski 2005). [34]

Traditional structural water quality BMPs (e.g. detention basins and other devices used to store volumes of runoff) unless they are highly engineered to provide adequate flow duration control, do not adequately protect receiving waters from accelerated channel bed and bank erosion, do not address post-development increases in runoff volume, and do not mitigate the decline in benthic macroinvertebrate communities in the receiving waters[35] suggest that structural BMPs are not as effective in protecting aquatic communities as a continuous riparian buffer of native vegetation. This is supported by the findings of Zucker and White[36], where instream biological metrics were correlated with the extent of forested buffers.

This General Permit requires dischargers to maintain pre-development drainage densities and times of concentration in order to protect channels and encourages dischargers to implement setbacks to reduce channel slope and velocity changes that can lead to aquatic habitat degradation.

There are a number of other approaches for modeling fluvial systems, including statistical and physical models and simpler stream power models.[37] The use of these models in California is described in Stein and Zaleski (2005).[38] Rather than prescribe a specific one-size-fits-all modeling method in this permit, the State Water Board intends to develop a stream power and channel evolution model-based framework to assess channels and develop a hierarchy of suitable analysis methods and management strategies. In time, this framework may become a State Water Board water quality control policy.

Permit Linkage to Overbank and Extreme Flood Protection
Site design BMPs (e.g. rooftop and impervious disconnection, vegetated swales, setbacks and buffers) filter and settle out pollutants and provide for more infiltration than is possible for traditional centralized structural BMPs placed at the lowest point in a site. They provide source control for runoff and lead to a reduction in pollutant loads. When implemented, they also help reduce the magnitude and volume of larger, less frequent storm events (e.g., 10-yr, 24-hour storm and larger), thereby reducing the need for expensive flood control infrastructure. Nonstructural BMPs can also be a landscape amenity, instead of a large isolated structure requiring substantial area for ancillary access, buffering, screening and maintenance facilities.[25] The multiple benefits of using non-structural benefits will be critically important as the state's population increases and imposes strains upon our existing water resources.

Maintaining predevelopment drainage densities and times of concentration will help reduce post-development peak flows and volumes in areas not covered under a municipal permit. The most effective way to preserve drainage areas and maximize time of concentration is to implement landform grading,

incorporate site design BMPs and implement distributed structural BMPs (e.g., bioretention cells, rain gardens, rain cisterns).

M. Storm Water Pollution Prevention Plans

USEPA's Construction General Permit requires that qualified personnel conduct inspections. USEPA defines qualified personnel as "a person knowledgeable in the principles and practice of erosion and sediment controls who possesses the skills to assess conditions at the construction site that could impact storm water quality and to assess the effectiveness of any sediment and erosion control measures selected to control the quality of storm water discharges from the construction activity."[39] USEPA also suggests that qualified personnel prepare SWPPPs and points to numerous states that require certified professionals to be on construction sites at all times. States that currently have certification programs are Washington, Georgia, Florida, Delaware, Maryland, and New Jersey. The Permit 99-08-DWQ did not require that qualified personnel prepare SWPPPs or conduct inspections. However, to ensure that water quality is being protected, this General Permit requires that all SWPPPs be written, amended, and certified by a Qualified SWPPP Developer. A Qualified SWPPP Developer must possess one of the eight certifications and or registrations specified in this General Permit and effective two years after the adoption date of this General Permit, must have attended a State Water Board-sponsored or approved Qualified SWPPP Developer training course. Table 9 provides an overview of the criteria used in determining qualified certification titles for a QSD and QSP.

The previous versions of the General Permit required development and implementation of a SWPPP as the primary compliance mechanism. The SWPPP has two major objectives: (1) to help identify the sources of sediment and other pollutants that affect the quality of storm water discharges; and (2) to describe and ensure the implementation of BMPs to reduce or eliminate sediment and other pollutants in storm water and non-storm water discharges. The SWPPP must include BMPs that address source control, BMPs that address pollutant control, and BMPs that address treatment control.

This General Permit shifts some of the measures that were covered by this general requirement to specific permit requirements, each individually enforceable as a permit term. This General Permit emphasizes the use of appropriately selected, correctly installed and maintained pollution reduction BMPs. This approach provides the flexibility necessary to establish BMPs that can effectively address source control of pollutants during changing construction activities. These specific requirements also improve both the clarity and the enforceability of the General Permit so that the dischargers understand, and the public can determine whether the discharges are in compliance with, permit requirements.

The SWPPP must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. The SWPPP must remain on the site during construction activities, commencing with the initial mobilization and ending with the termination of coverage under the General Permit. For LUPs the discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio or telephone. Once construction activities are complete, until stabilization is achieved, the SWPPP shall be available from the SWPPP contact listed in the PRDs

A SWPPP must be appropriate for the type and complexity of a project and will be developed and implemented to address project specific conditions. Some projects may have similarities or complexities, yet each project is unique in its progressive state that requires specific description and selection of BMPs needed to address all possible generated pollutants

N. Regional Water Board Authorities

Because this General Permit will be issued to thousands of construction sites across the State, the Regional Water Boards retain discretionary authority over certain issues that may arise from the discharges in their respective regions. This General Permit does not grant the Regional Water Boards any authority they do not otherwise have; rather, it merely emphasizes that the Regional Water Boards can take specific actions related to this General Permit. For example, the Regional Water Boards will be enforcing this General Permit and may need to adjust some requirements for a discharger based on the discharger’s compliance history.

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM
GENERAL PERMIT NO. CAS000002

WASTE DISCHARGE REQUIREMENTS
FOR
DISCHARGES OF STORM WATER RUNOFF ASSOCIATED WITH CONSTRUCTION AND LAND DISTURBANCE ACTIVITIES

I. FINDINGS

A. General Findings

The State Water Resources Control Board (State Water Board) finds that:

1. The federal Clean Water Act (CWA) prohibits certain discharges of storm water containing pollutants except in compliance with a National Pollutant Discharge Elimination System (NPDES) permit (Title 33 United States Code (U.S.C.) §§ 1311 and 1342(p); also referred to as Clean Water Act (CWA) §§ 301 and 402(p)). The U.S. Environmental Protection Agency (U.S. EPA) promulgates federal regulations to implement the CWA's mandate to control pollutants in storm water runoff discharges. (Title 40 Code of Federal Regulations (C.F.R.) Parts 122, 123, and 124). The federal statutes and regulations require discharges to surface waters comprised of storm water associated with construction activity, including demolition, clearing, grading, and excavation, and other land disturbance activities (except operations that result in disturbance of less than one acre of total land area and which are not part of a larger common plan of development or sale), to obtain coverage under an NPDES permit. The NPDES permit must require implementation of Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to reduce or eliminate pollutants in storm water runoff. The NPDES permit must also include additional requirements necessary to implement applicable water quality standards.

2. This General Permit authorizes discharges of storm water associated with construction activity so long as the dischargers comply with all requirements, provisions, limitations and prohibitions in the permit. In addition, this General Permit regulates the discharges of storm water associated with construction activities from all Linear

Underground/Overhead Projects resulting in the disturbance of greater than or equal to one acre (Attachment A).

3. This General Permit regulates discharges of pollutants in storm water associated with construction activity (storm water discharges) to waters of the United States from construction sites that disturb one or more acres of land surface, or that are part of a common plan of development or sale that disturbs more than one acre of land surface.

4. This General Permit does not preempt or supersede the authority of local storm water management agencies to prohibit, restrict, or control storm water discharges to municipal separate storm sewer systems or other watercourses within their jurisdictions.

5. This action to adopt a general NPDES permit is exempt from the provisions of Chapter 3 of the California Environmental Quality Act (CEQA) (Public Resources Code Section 21100, et seq.), pursuant to Section 13389 of the California Water Code.

6. Pursuant to 40 C.F.R. § 131.12 and State Water Board Resolution No. 68-16,[1] which incorporates the requirements of § 131.12 where applicable, the State Water Board finds that discharges in compliance with this General Permit will not result in the lowering of water quality standards, and are therefore consistent with those provisions. Compliance with this General Permit will result in improvements in water quality.

7. This General Permit serves as an NPDES permit in compliance with CWA § 402 and will take effect on July 1, 2010 by the State Water Board provided the Regional Administrator of the U.S. EPA has no objection. If the U.S. EPA Regional Administrator objects to its issuance, the General Permit will not become effective until such objection is withdrawn.

8. Following adoption and upon the effective date of this General Permit, the Regional Water Quality Control Boards (Regional Water Boards) shall enforce the provisions herein.

9. Regional Water Boards establish water quality standards in Basin Plans. The State Water Board establishes water quality standards in various statewide plans, including the California Ocean Plan. U.S. EPA establishes water quality standards in the National Toxic Rule (NTR) and the California Toxic Rule (CTR).

[1] Resolution No. 68-16 generally requires that existing water quality be maintained unless degradation is justified based on specific findings.

10. This General Permit does not authorize discharges of fill or dredged material regulated by the U.S. Army Corps of Engineers under CWA § 404 and does not constitute a waiver of water quality certification under CWA § 401.

11. The primary storm water pollutant at construction sites is excess sediment. Excess sediment can cloud the water, which reduces the amount of sunlight reaching aquatic plants, clog fish gills, smother aquatic habitat and spawning areas, and impede navigation in our waterways. Sediment also transports other pollutants such as nutrients, metals, and oils and greases.

12. Construction activities can impact a construction site's runoff sediment supply and transport characteristics. These modifications, which can occur both during and after the construction phase, are a significant cause of degradation of the beneficial uses established for water bodies in California. Dischargers can avoid these effects through better construction site design and activity practices.

13. This General Permit recognizes four distinct phases of construction activities. The phases are Grading and Land Development Phase, Streets and Utilities Phase, Vertical Construction Phase, and Final Landscaping and Site Stabilization Phase. Each phase has activities that can result in different water quality effects from different water quality pollutants. This General Permit also recognizes inactive construction as a category of construction site type.

14. Compliance with any specific limits or requirements contained in this General Permit does not constitute compliance with any other applicable requirements.

15. Following public notice in accordance with State and Federal laws and regulations, the State Water Board heard and considered all comments and testimony in a public hearing on 06/03/2009. The State Water Board has prepared written responses to all significant comments.

16. Construction activities obtaining coverage under the General Permit may have multiple discharges subject to requirements that are specific to general, linear, and/or active treatment system discharge types.

17. The State Water Board may reopen the permit if the U.S. EPA adopts a final effluent limitation guideline for construction activities.

B. Activities Covered Under the General Permit

18. Any construction or demolition activity, including, but not limited to, clearing, grading, grubbing, or excavation, or any other activity that results in a land disturbance of equal to or greater than one acre.

19. Construction activity that results in land surface disturbances of less than one acre if the construction activity is part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

20. Construction activity related to residential, commercial, or industrial development on lands currently used for agriculture including, but not limited to, the construction of buildings related to agriculture that are considered industrial pursuant to U.S. EPA regulations, such as dairy barns or food processing facilities.

21. Construction activity associated with Linear Underground/Overhead Utility Projects (LUPs) including, but not limited to, those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/borrow locations.

22. Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities.[2]

23. Storm water discharges from dredge spoil placement that occur outside of U.S. Army Corps of Engineers jurisdiction (upland sites) and that disturb one or more acres of land surface from construction activity are covered by this General Permit. Construction sites that intend to disturb one or more acres of land within the jurisdictional boundaries of

[2] Pursuant to the Ninth Circuit Court of Appeals' decision in *NRDC v. EPA* (9th Cir. 2008) 526 F.3d 591, and subsequent denial of the U.S. EPA's petition for reconsideration in November 2008, oil and gas construction activities discharging storm water contaminated only with sediment are no longer exempt from the NPDES program.

a CWA § 404 permit should contact the appropriate Regional Water Board to determine whether this permit applies to the site.

C. Activities Not Covered Under the General Permit

24. Routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of the facility.

25. Disturbances to land surfaces solely related to agricultural operations such as disking, harrowing, terracing and leveling, and soil preparation.

26. Discharges of storm water from areas on tribal lands; construction on tribal lands is regulated by a federal permit.

27. Construction activity and land disturbance involving discharges of storm water within the Lake Tahoe Hydrologic Unit. The Lahontan Regional Water Board has adopted its own permit to regulate storm water discharges from construction activity in the Lake Tahoe Hydrologic Unit (Regional Water Board 6SLT). Owners of construction sites in this watershed must apply for the Lahontan Regional Water Board permit rather than the statewide Construction General Permit.

28. Construction activity that disturbs less than one acre of land surface, and that is not part of a larger common plan of development or the sale of one or more acres of disturbed land surface.

29. Construction activity covered by an individual NPDES Permit for storm water discharges.

30. Discharges from small (1 to 5 acre) construction activities with an approved Rainfall Erosivity Waiver authorized by U.S. EPA Phase II regulations certifying to the State Board that small construction activity will occur only when the Rainfall Erosivity Factor is less than 5 (“R” in the Revised Universal Soil Loss Equation).

31. Landfill construction activity that is subject to the Industrial General Permit.

32. Construction activity that discharges to Combined Sewer Systems.

33. Conveyances that discharge storm water runoff combined with municipal sewage.

34. Discharges of storm water identified in CWA § 402(*l*)(2), 33 U.S.C. § 1342(*l*)(2).

35. Discharges occurring in basins that are not tributary or hydrologically connected to waters of the United States (for more information contact your Regional Water Board).

D. Obtaining and Modifying General Permit Coverage

36. This General Permit requires all dischargers to electronically file all Permit Registration Documents (PRDs), Notices of Termination (NOT), changes of information, annual reporting, and other compliance documents required by this General Permit through the State Water Board's Storm water Multi-Application and Report Tracking System (SMARTS) website.

37. Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

38. This General Permit grants an exception from the Risk Determination requirements for existing sites covered under Water Quality Orders No. 99-08-DWQ, and No. 2003-0007-DWQ. For certain sites, adding additional requirements may not be cost effective. Construction sites covered under Water Quality Order No. 99-08-DWQ shall obtain permit coverage at the Risk Level 1. LUPs covered under Water Quality Order No. 2003-0007-DWQ shall obtain permit coverage as a Type 1 LUP. The Regional Water Boards have the authority to require Risk Determination to be performed on sites currently covered under Water Quality Orders No. 99-08-DWQ and No. 2003-0007-DWQ where they deem it necessary. The State Water Board finds that there are two circumstances when it may be appropriate for the Regional Water Boards to require a discharger that had filed an NOI under State Water Board Order No. 99-08-DWQ to recalculate the site's risk level. These circumstances are: (1) when the discharger has a demonstrated history of noncompliance with State Water Board Order No. 99-08-DWQ or; (2) when the discharger's site poses a significant risk of causing or contributing to an exceedance of a water quality standard without the implementation of the additional Risk Level 2 or 3 requirements.

E. Prohibitions

39. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit. Non-storm water discharges include a wide variety of sources, including improper dumping, spills, or leakage from storage tanks or transfer areas. Non-storm water discharges may

contribute significant pollutant loads to receiving waters. Measures to control spills, leakage, and dumping, and to prevent illicit connections during construction must be addressed through structural as well as non-structural Best Management Practices (BMPs)[3]. The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction.

40. This General Permit prohibits all discharges which contain a hazardous substance in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

41. This General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the State Water Board and the nine Regional Water Boards.

42. Pursuant to the Ocean Plan, discharges to Areas of Special Biological Significance (ASBS) are prohibited unless covered by an exception that the State Water Board has approved.

43. This General Permit prohibits the discharge of any debris[4] from construction sites. Plastic and other trash materials can cause negative impacts to receiving water beneficial uses. The State Water Board encourages the use of more environmentally safe, biodegradable materials on construction sites to minimize the potential risk to water quality.

F. Training

44. In order to improve compliance with and to maintain consistent enforcement of this General Permit, all dischargers are required to appoint two positions - the Qualified SWPPP Developer (QSD) and the Qualified SWPPP Practitioner (QSP) - who must obtain appropriate training. Together with the key stakeholders, the State and Regional Water Boards are leading the development of this curriculum through a collaborative organization called The Construction General Permit (CGP) Training Team.

45. The Professional Engineers Act (Bus. & Prof. Code section 6700, et seq.) requires that all engineering work must be performed by a California licensed engineer.

[3] BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants to waters of the United States. BMPs also include treatment requirements, operating procedures, and practice to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

[4] Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

G. Determining and Reducing Risk

46. The risk of accelerated erosion and sedimentation from wind and water depends on a number of factors, including proximity to receiving water bodies, climate, topography, and soil type.

47. This General Permit requires dischargers to assess the risk level of a site based on both sediment transport and receiving water risk. This General Permit contains requirements for Risk Levels 1, 2 and 3, and LUP Risk Type 1, 2, and 3 (Attachment A). Risk levels are established by determining two factors: first, calculating the site's sediment risk; and second, receiving water risk during periods of soil exposure (i.e. grading and site stabilization). Both factors are used to determine the site-specific Risk Level(s). LUPs can be determined to be Type 1 based on the flowchart in Attachment A.1.

48. Although this General Permit does not mandate specific setback distances, dischargers are encouraged to set back their construction activities from streams and wetlands whenever feasible to reduce the risk of impacting water quality (e.g., natural stream stability and habitat function). Because there is a reduced risk to receiving waters when setbacks are used, this General Permit gives credit to setbacks in the risk determination and post-construction storm water performance standards. The risk calculation and runoff reduction mechanisms in this General Permit are expected to facilitate compliance with any Regional Water Board and local agency setback requirements, and to encourage voluntary setbacks wherever practicable.

49. Rain events can occur at any time of the year in California. Therefore, a Rain Event Action Plan (REAP) is necessary for Risk Level 2 and 3 traditional construction projects (LUPs exempt) to ensure that active construction sites have adequate erosion and sediment controls implemented prior to the onset of a storm event, even if construction is planned only during the dry season.

50. Soil particles smaller than 0.02 millimeters (mm) (i.e., finer than medium silt) do not settle easily using conventional measures for sediment control (i.e., sediment basins). Given their long settling time, dislodging these soils results in a significant risk that fine particles will be released into surface waters and cause unacceptable downstream impacts. If operated correctly, an Active Treatment System (ATS[5]) can prevent or reduce the release of fine particles from construction sites.

[5] An ATS is a treatment system that employs chemical coagulation, chemical flocculation, or electro coagulation in order to reduce turbidity caused by fine suspended sediment.

Use of an ATS can effectively reduce a site's risk of impacting receiving waters.

51. Dischargers located in a watershed area where a Total Maximum Daily Load (TMDL) has been adopted or approved by the Regional Water Board or U.S. EPA may be required by a separate Regional Water Board action to implement additional BMPs, conduct additional monitoring activities, and/or comply with an applicable waste load allocation and implementation schedule. Such dischargers may also be required to obtain an individual Regional Water Board permit specific to the area.

H. Effluent Standards

52. The State Water Board convened a blue ribbon panel of storm water experts that submitted a report entitled, “The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities,” dated June 19, 2006. The panel concluded that numeric limits or action levels are technically feasible to control construction storm water discharges, provided that certain conditions are considered. The panel also concluded that numeric effluent limitations (NELs) are feasible for discharges from construction sites that utilize an ATS. The State Water Board has incorporated the expert panel’s suggestions into this General Permit, which includes numeric action levels (NALs) for pH and turbidity, and special numeric limits for ATS discharges.

Determining Compliance with Numeric Limitations

53. This General Permit sets a pH NAL of 6.5 to 8.5, and a turbidity NAL of 250 NTU. The purpose of the NAL and its associated monitoring requirement is to provide operational information regarding the performance of the measures used at the site to minimize the discharge of pollutants and to protect beneficial uses and receiving waters from the adverse effects of construction-related storm water discharges. An exceedance of a NAL does not constitute a violation of this General Permit.

54. This General Permit requires dischargers with NAL exceedances to immediately implement additional BMPs and revise their Storm Water Pollution Prevention Plans (SWPPPs) accordingly to either prevent pollutants and authorized non-storm water discharges from contaminating storm water, or to substantially reduce the pollutants to levels consistently below the NALs. NAL exceedances are reported in the State Water Boards SMARTS system, and the discharger is

required to provide an NAL Exceedance Report when requested by a Regional Water Board.

I. Receiving Water Limitations

55. This General Permit requires all enrolled dischargers to determine the receiving waters potentially affected by their discharges and to comply with all applicable water quality standards, including any more stringent standards applicable to a water body.

J. Sampling, Monitoring, Reporting and Record Keeping

56. Visual monitoring of storm water and non-storm water discharges is required for all sites subject to this General Permit.

57. Records of all visual monitoring inspections are required to remain on-site during the construction period and for a minimum of three years.

58. For all Risk Level 3/LUP Type 3 and Risk Level 2/LUP Type 2 sites, this General Permit requires effluent monitoring for pH and turbidity. Sampling, analysis and monitoring requirements for effluent monitoring for pH and turbidity are contained in this General Permit.

59. Risk Level 3 and LUP Type 3 sites with effluent that exceeds the Receiving Water Monitoring Triggers contained in this General Permit and with direct discharges to receiving water are required to conduct receiving water monitoring. An exceedance of a Receiving Water Monitoring Trigger does not constitute a violation of this General Permit.

60. This General Permit establishes a 5 year, 24 hour (expressed in inches of rainfall) as an exemptions to the receiving water monitoring requirements for Risk Level 3 and LUP Type 3 dischargers.

61. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

62. For Risk Level 3 and LUP Type 3 sites larger than 30 acres and with direct discharges to receiving waters, this General Permit requires bioassessment sampling before and after site completion to determine if significant degradation to the receiving water's biota has occurred. Bioassessment sampling guidelines are contained in this General Permit.

63. A summary and evaluation of the sampling and analysis results will be submitted in the Annual Reports.

64. This General Permit contains sampling, analysis and monitoring requirements for non-visible pollutants at all sites subject to this General Permit.

65. Compliance with the General Permit relies upon dischargers to electronically self-report any discharge violations and to comply with any Regional Water Board enforcement actions.

66. This General Permit requires that all dischargers maintain a paper or electronic copy of all required records for three years from the date generated or date submitted, whichever is last. These records must be available at the construction site until construction is completed. For LUPs, these documents may be retained in a crew member's vehicle and made available upon request.

K. Active Treatment System (ATS) Requirements

67. Active treatment systems add chemicals to facilitate flocculation, coagulation and filtration of suspended sediment particles. The uncontrolled release of these chemicals to the environment can negatively affect the beneficial uses of receiving waters and/or degrade water quality (e.g., acute and chronic toxicity). Additionally, the batch storage and treatment of storm water through an ATS' can potentially cause physical impacts on receiving waters if storage volume is inadequate or due to sudden releases of the ATS batches and improperly designed outfalls.

68. If designed, operated and maintained properly an ATS can achieve very high removal rates of suspended sediment (measured as turbidity), albeit at sometimes significantly higher costs than traditional erosion/sediment control practices. As a result, this General Permit establishes NELs consistent with the expected level of typical ATS performance.

69. This General Permit requires discharges of storm water associated with construction activity that undergo active treatment to comply with special operational and effluent limitations to ensure that these discharges do not adversely affect the beneficial uses of the receiving waters or cause degradation of their water quality.

70. For ATS discharges, this General Permit establishes technology-based NELs for turbidity.

71. This General Permit establishes a 10 year, 24 hour (expressed in inches of rainfall) Compliance Storm Event exemption from the technology-based numeric effluent limitations for ATS discharges. Exceedances of the ATS turbidity NEL constitutes a violation of this General Permit.

L. Post-Construction Requirements

72. This General Permit includes performance standards for post-construction that are consistent with State Water Board Resolution No. 2005-0006, "Resolution Adopting the Concept of Sustainability as a Core Value for State Water Board Programs and Directing Its Incorporation," and 2008-0030, "Requiring Sustainable Water Resources Management." The requirement for all construction sites to match pre-project hydrology will help ensure that the physical and biological integrity of aquatic ecosystems are sustained. This "runoff reduction" approach is analogous in principle to Low Impact Development (LID) and will serve to protect related watersheds and waterbodies from both hydrologic-based and pollution impacts associated with the post-construction landscape.

73. LUP projects are not subject to post-construction requirements due to the nature of their construction to return project sites to pre-construction conditions.

M. Storm Water Pollution Prevention Plan Requirements

74. This General Permit requires the development of a site-specific SWPPP. The SWPPP must include the information needed to demonstrate compliance with all requirements of this General Permit, and must be kept on the construction site and be available for review. The discharger shall ensure that a QSD develops the SWPPP.

75. To ensure proper site oversight, this General Permit requires a Qualified SWPPP Practitioner to oversee implementation of the BMPs required to comply with this General Permit.

N. Regional Water Board Authorities

76. Regional Water Boards are responsible for implementation and enforcement of this General Permit. A general approach to permitting is not always suitable for every construction site and environmental circumstances. Therefore, this General Permit recognizes that Regional Water Boards must have some flexibility and authority to alter, approve, exempt, or rescind permit authority granted under this

General Permit in order to protect the beneficial uses of our receiving waters and prevent degradation of water quality.

IT IS HEREBY ORDERED that all dischargers subject to this General Permit shall comply with the following conditions and requirements (including all conditions and requirements as set forth in Attachments A, B, C, D, E and F)[6]:

II. CONDITIONS FOR PERMIT COVERAGE

A. Linear Underground/Overhead Projects (LUPs)

1. Linear Underground/Overhead Projects (LUPs) include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water and wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g. telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, (a) those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment, and associated ancillary facilities); and include, but are not limited to, (b) underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/ or pavement repair or replacement, and stockpile/borrow locations.

2. The Legally Responsible Person is responsible for obtaining coverage under the General Permit where the construction of pipelines, utility lines, fiber-optic cables, or other linear underground/overhead projects will occur across several properties unless the LUP construction activities are covered under another construction storm water permit.

3. Only LUPs shall comply with the conditions and requirements in Attachment A, A.1 & A.2 of this Order. The balance of this Order is not applicable to LUPs except as indicated in Attachment A.

[6] These attachments are part of the General Permit itself and are not separate documents that are capable of being updated independently by the State Water Board.

B. Obtaining Permit Coverage Traditional Construction Sites

1. The Legally Responsible Person (LRP) (see Special Provisions, Electronic Signature and Certification Requirements, Section IV.I.1) must obtain coverage under this General Permit.

2. To obtain coverage, the LRP must electronically file Permit Registration Documents (PRDs) prior to the commencement of construction activity. Failure to obtain coverage under this General Permit for storm water discharges to waters of the United States is a violation of the CWA and the California Water Code.

3. PRDs shall consist of:

   a. Notice of Intent (NOI)
   b. Risk Assessment (Section VIII)
   c. Site Map
   d. Storm Water Pollution Prevention Plan (Section XIV)
   e. Annual Fee
   f. Signed Certification Statement

   Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted.

   Attachment B contains additional PRD information. Dischargers must electronically file the PRDs, and mail the appropriate annual fee to the State Water Board.

4. This permit is effective on July 1, 2010.

   a. **Dischargers Obtaining Coverage On or After July 1, 2010:** All dischargers requiring coverage on or after July 1, 2010, shall electronically file their PRDs prior to the commencement of construction activities, and mail the appropriate annual fee no later than seven days prior to the commencement of construction activities. Permit coverage shall not commence until the PRDs and the annual fee are received by the State Water Board, and a WDID number is assigned and sent by SMARTS.

   b. **Dischargers Covered Under 99-08-DWQ and 2003-0007-DWQ:** Existing dischargers subject to State Water Board Order No. 99-08-DWQ (existing dischargers) will continue coverage under 99-08-DWQ until July 1, 2010. After July 1, 2010, all NOIs subject to State Water Board Order No. 99-08-DWQ will be terminated.

Existing dischargers shall electronically file their PRDs no later than July 1, 2010. If an existing discharger's site acreage subject to the annual fee has changed, it shall mail a revised annual fee no less than seven days after receiving the revised annual fee notification, **or else lose permit coverage**. All existing dischargers shall be exempt from the risk determination requirements in Section VIII of this General Permit until two years after permit adoption. All existing dischargers are therefore subject to Risk Level 1 requirements regardless of their site's sediment and receiving water risks. However, a Regional Board retains the authority to require an existing discharger to comply with the Section VIII risk determination requirements.

5. The discharger is only considered covered by this General Permit upon receipt of a Waste Discharger Identification (WDID) number assigned and sent by the State Water Board Storm water Multi-Application and Report Tracking System (SMARTS). In order to demonstrate compliance with this General Permit, the discharger must obtain a WDID number and must present documentation of a valid WDID upon demand.

6. During the period this permit is subject to review by the U.S. EPA, the prior permit (State Water Board Order No. 99-08-DWQ) remains in effect. Existing dischargers under the prior permit will continue to have coverage under State Water Board Order No. 99-08-DWQ until this General Permit takes effect on July 1, 2010. Dischargers who complete their projects and electronically file an NOT prior to July 1, 2010, are not required to obtain coverage under this General Permit.

7. Small Construction Rainfall Erosivity Waiver

   EPA's Small Construction Erosivity Waiver applies to sites between one and five acres demonstrating that there are no adverse water quality impacts.

   Dischargers eligible for a Rainfall Erosivity Waiver based on low erosivity potential shall complete the electronic Notice of Intent (NOI) and Sediment Risk form through the State Water Board's SMARTS system, certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Where the LRP changes or another LRP is added during construction, the new LRP must also submit a waiver certification through the SMARTS system.

   If a small construction site continues beyond the projected completion date given on the waiver certification, the LRP shall recalculate the

rainfall erosivity factor for the new project duration and submit this information through the SMARTS system. If the new R factor is below five (5), the discharger shall update through SMARTS all applicable information on the waiver certification and retain a copy of the revised waiver onsite. The LRP shall submit the new waiver certification 30 days prior to the projected completion date listed on the original waiver form to assure exemption from permitting requirements is uninterrupted. If the new R factor is five (5) or above, the LRP shall be required to apply for coverage under this Order.

8. In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

C. Revising Permit Coverage for Change of Acreage or New Ownership

1. The discharger may reduce or increase the total acreage covered under this General Permit when a portion of the site is complete and/or conditions for termination of coverage have been met (See Section II.D Conditions for Termination of Coverage); when ownership of a portion of the site is sold to a different entity; or when new acreage, subject to this General Permit, is added to the site.

2. Within 30 days of a reduction or increase in total disturbed acreage, the discharger shall electronically file revisions to the PRDs that include:

   a. A revised NOI indicating the new project size;

   b. A revised site map showing the acreage of the site completed, acreage currently under construction, acreage sold/transferred or added, and acreage currently stabilized in accordance with the Conditions for Termination of Coverage in Section II.D below.

   c. SWPPP revisions, as appropriate; and

   d. Certification that any new landowners have been notified of applicable requirements to obtain General Permit coverage. The certification shall include the name, address, telephone number, and e-mail address of the new landowner.

   e. If the project acreage has increased, dischargers shall mail payment of revised annual fees within 14 days of receiving the revised annual fee notification.

3. The discharger shall continue coverage under the General Permit for any parcel that has not achieved "Final Stabilization" as defined in Section II.D.

4. When an LRP with active General Permit coverage transfers its LRP status to another person or entity that qualifies as an LRP, the existing LRP shall inform the new LRP of the General Permit's requirements. In order for the new LRP to continue the construction activity on its parcel of property, the new LRP, or the new LRP's approved signatory, must submit PRDs in accordance with this General Permit's requirements.

D. Conditions for Termination of Coverage

1. Within 90 days of when construction is complete or ownership has been transferred, the discharger shall electronically file a Notice of Termination (NOT), a final site map, and photos through the State Water Boards SMARTS system. Filing a NOT certifies that all General Permit requirements have been met. The Regional Water Board will consider a construction site complete only when all portions of the site have been transferred to a new owner, or all of the following conditions have been met:

   a. For purposes of "final stabilization," the site will not pose any additional sediment discharge risk than it did prior to the commencement of construction activity;

   b. There is no potential for construction-related storm water pollutants to be discharged into site runoff;

   c. Final stabilization has been reached;

   d. Construction materials and wastes have been disposed of properly;

   e. Compliance with the Post-Construction Standards in Section XIII of this General Permit has been demonstrated;

   f. Post-construction storm water management measures have been installed and a long-term maintenance plan[7] has been established; and

   g. All construction-related equipment, materials and any temporary BMPs no longer needed are removed from the site.

[7] For the purposes of this requirement a long-term maintenance plan will be designed for a minimum of five years, and will describe the procedures to ensure that the post-construction storm water management measures are adequately maintained.

2. The discharger shall certify that final stabilization conditions are satisfied in their NOT. Failure to certify shall result in continuation of permit coverage and annual billing.

3. The NOT must demonstrate through photos, RUSLE or RUSLE2, or results of testing and analysis that the site meets all of the conditions above (Section II.D.1) and the final stabilization condition (Section II.D.1.a) is attained by one of the following methods:

   a. "70% final cover method," no computational proof required

      OR:

   b. "RUSLE or RUSLE2 method," computational proof required

      OR:

   c. "Custom method", the discharger shall demonstrate in some other manner than a or b, above, that the site complies with the "final stabilization" requirement in Section II.D.1.a.

III. DISCHARGE PROHIBITIONS

A. Dischargers shall not violate any discharge prohibitions contained in applicable Basin Plans or statewide water quality control plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan, unless granted an exception issued by the State Water Board.

B. All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit.

C. Authorized non-storm water discharges may include those from de-chlorinated potable water sources such as: fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, uncontaminated ground water from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board. The discharge of non-storm water is authorized under the following conditions:

1. The discharge does not cause or contribute to a violation of any water quality standard;

2. The discharge does not violate any other provision of this General Permit;

3. The discharge is not prohibited by the applicable Basin Plan;

4. The discharger has included and implemented specific BMPs required by this General Permit to prevent or reduce the contact of the non-storm water discharge with construction materials or equipment.

5. The discharge does not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants;

6. The discharge is monitored and meets the applicable NALs; and

7. The discharger reports the sampling information in the Annual Report.

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not already authorized by this General Permit or another NPDES permit, to determine whether a separate NPDES permit is necessary.

D. Debris resulting from construction activities are prohibited from being discharged from construction sites.

E. When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the discharger shall have those soils sampled and tested to ensure proper handling and public safety measures are implemented. The discharger shall notify the appropriate local, State, and federal agency(ies) when contaminated soil is found at a construction site, and will notify the appropriate Regional Water Board.

IV. SPECIAL PROVISIONS

A. Duty to Comply

1. The discharger shall comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

2. The discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

B. General Permit Actions

1. This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

2. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

C. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

D. Duty to Mitigate

The discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

E. Proper Operation and Maintenance

The discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

F. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

G. Duty to Maintain Records and Provide Information

1. The discharger shall maintain a paper or electronic copy of all required records, including a copy of this General Permit, for three years from the date generated or date submitted, whichever is last. These records shall be available at the construction site until construction is completed.

2. The discharger shall furnish the Regional Water Board, State Water Board, or U.S. EPA, within a reasonable time, any requested information to determine compliance with this General Permit. The discharger shall also furnish, upon request, copies of records that are required to be kept by this General Permit.

H. Inspection and Entry

The discharger shall allow the Regional Water Board, State Water Board, U.S. EPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the discharger's premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

2. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

3. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

4. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

I. Electronic Signature and Certification Requirements

1. All Permit Registration Documents (PRDs) and Notices of Termination (NOTs) shall be electronically signed, certified, and submitted via SMARTS to the State Water Board. Either the Legally Responsible Person (LRP), as defined in Appendix 5 – Glossary, or a person legally authorized to sign and certify PRDs and NOTs on behalf of the LRP (the LRP's Approved Signatory, as defined in Appendix 5 - Glossary) must submit all information electronically via SMARTS.

2. Changes to Authorization. If an Approved Signatory's authorization is no longer accurate, a new authorization satisfying the requirements of paragraph (a) of this section must be submitted via SMARTS prior to or together with any reports, information or applications to be signed by an Approved Signatory.

3. All Annual Reports, or other information required by the General Permit (other than PRDs and NOTs) or requested by the Regional Water Board, State Water Board, U.S. EPA, or local storm water management agency shall be certified and submitted by the LRP or the LRP's Approved Signatory.

J. Certification

Any person signing documents under Section IV.I above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

K. Anticipated Noncompliance

The discharger shall give advance notice to the Regional Water Board and local storm water management agency of any planned changes in the construction activity, which may result in noncompliance with General Permit requirements.

L. Bypass

Bypass[8] is prohibited. The Regional Water Board may take enforcement action against the discharger for bypass unless:

1. Bypass was unavoidable to prevent loss of life, personal injury or severe property damage;[9]

2. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities, retention of untreated waste, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that could occur during normal periods of equipment downtime or preventative maintenance;

3. The discharger submitted a notice at least ten days in advance of the need for a bypass to the Regional Water Board; or

4. The discharger may allow a bypass to occur that does not cause effluent limitations to be exceeded, but only if it is for essential maintenance to assure efficient operation. In such a case, the above bypass conditions are not applicable. The discharger shall submit notice of an unanticipated bypass as required.

M. Upset

1. A discharger that wishes to establish the affirmative defense of an upset[10] in an action brought for noncompliance shall demonstrate,

[8] The intentional diversion of waste streams from any portion of a treatment facility

[9] Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.

[10] An exceptional incident in which there is unintentional and temporary noncompliance the technology based numeric effluent limitations because of factors beyond the reasonable control of the discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventative maintenance, or careless or improper operation.

through properly signed, contemporaneous operating logs, or other relevant evidence that:

a. An upset occurred and that the discharger can identify the cause(s) of the upset

b. The treatment facility was being properly operated by the time of the upset

c. The discharger submitted notice of the upset as required; and

d. The discharger complied with any remedial measures required

2. No determination made before an action of noncompliance occurs, such as during administrative review of claims that noncompliance was caused by an upset, is final administrative action subject to judicial review.

3. In any enforcement proceeding, the discharger seeking to establish the occurrence of an upset has the burden of proof

N. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

O. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the discharger is or may be subject to under Section 311 of the CWA.

P. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

Q. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of U.S. EPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

R. Penalties for Violations of Permit Conditions

1. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[11] per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

2. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which in some cases are greater than those under the CWA.

S. Transfers

This General Permit is not transferable.

T. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

[11] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act.

V. EFFLUENT STANDARDS & RECEIVING WATER MONITORING

A. Narrative Effluent Limitations

1. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

2. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

Table 1- Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
		Risk Level 3			lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2	1	NTU	250 NTU
		Risk Level 3			250 NTU

B. Numeric Action Levels (NALs)

1. For Risk Level 2 and 3 dischargers, the lower storm event average NAL for pH is 6.5 pH units and the upper storm event average NAL for

pH is 8.5 pH units. The discharger shall take actions as described below if the discharge is outside of this range of pH values.

2. For Risk Level 2 and 3 dischargers, the NAL storm event daily average for turbidity is 250 NTU. The discharger shall take actions as described below if the discharge is outside of this range of turbidity values.

3. Whenever the results from a storm event daily average indicate that the discharge is below the lower NAL for pH, exceeds the upper NAL for pH, or exceeds the turbidity NAL (as listed in Table 1), the discharger shall conduct a construction site and run-on evaluation to determine whether pollutant source(s) associated with the site's construction activity may have caused or contributed to the NAL exceedance and shall immediately implement corrective actions if they are needed.

4. The site evaluation shall be documented in the SWPPP and specifically address whether the source(s) of the pollutants causing the exceedance of the NAL:

   a. Are related to the construction activities and whether additional BMPs are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) determine what corrective action(s) were taken or will be taken and with a description of the schedule for completion.

      AND/OR:

   b. Are related to the run-on associated with the construction site location and whether additional BMPs measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) what corrective action(s) were taken or will be taken with a description of the schedule for completion.

C. Receiving Water Monitoring Triggers

1. The receiving water monitoring triggers for Risk Level 3 dischargers with direct discharges to surface waters are triggered when the daily average effluent pH values during any site phase when there is a high risk of pH discharge[12] fall outside of the range of 6.0 and 9.0 pH units, or when the daily average effluent turbidity exceeds 500 NTU.

2. Risk Level 3 dischargers with with direct discharges to surface waters shall conduct receiving water monitoring whenever their effluent monitoring results exceed the receiving water monitoring triggers. If the pH trigger is exceeded, the receiving water shall be monitored for pH for the duration of coverage under this General Permit. If the turbidity trigger is exceeded, the receiving water shall be monitored for turbidity and SSC for the duration of coverage under this general permit.

3. Risk Level 3 dischargers with direct discharges to surfaces waters shall initiate receiving water monitoring when the triggers are exceeded unless the storm event causing the exceedance is determined after the fact to equal to or greater than the 5-year 24-hour storm (expressed in inches of rainfall) as determined by using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca5y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca5y24.gif

   Verification of the 5-year 24-hour storm event shall be done by reporting on-site rain gauge readings as well as nearby governmental rain gauge readings.

4. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

[12] A period of high risk of pH discharge is defined as a project's complete utilities phase, complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations of the background pH of the discharges.

VI. RECEIVING WATER LIMITATIONS

A. The discharger shall ensure that storm water discharges and authorized non-storm water discharges to any surface or ground water will not adversely affect human health or the environment.

B. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

C. The discharger shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards (collectively, WQS) contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan).

D. Dischargers located within the watershed of a CWA § 303(d) impaired water body, for which a TMDL has been approved by the U.S. EPA, shall comply with the approved TMDL if it identifies "construction activity" or land disturbance as a source of the pollution.

VII. TRAINING QUALIFICATIONS AND CERTIFICATION REQUIREMENTS

A. General

The discharger shall ensure that all persons responsible for implementing requirements of this General Permit shall be appropriately trained in accordance with this Section. Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Those responsible for preparing and amending SWPPPs shall comply with the requirements in this Section VII.

The discharger shall provide documentation of all training for persons responsible for implementing the requirements of this General Permit in the Annual Reports.

B. SWPPP Certification Requirements

1. **Qualified SWPPP Developer:** The discharger shall ensure that SWPPPs are written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

   a. A California registered professional civil engineer;

   b. A California registered professional geologist or engineering geologist;

   c. A California registered landscape architect;

   d. A professional hydrologist registered through the American Institute of Hydrology;

   e. A Certified Professional in Erosion and Sediment Control (CPESC) ™ registered through Enviro Cert International, Inc.;

   f. A Certified Professional in Storm Water Quality (CPSWQ) ™ registered through Enviro Cert International, Inc.; or

   g. A professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET).

Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

2. The discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

3. **Qualified SWPPP Practitioner:** The discharger shall ensure that all BMPs required by this General Permit are implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   a. A certified erosion, sediment and storm water inspector registered through Enviro Cert International, Inc.; or

   b. A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc.

   Effective two years after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

4. The LRP shall list in the SWPPP, the name of any Approved Signatory, and provide a copy of the written agreement or other mechanism that provides this authority from the LRP in the SWPPP.

5. The discharger shall include, in the SWPPP, a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

6. The discharger shall ensure that the SWPPP and each amendment will be signed by the Qualified SWPPP Developer. The discharger shall include a listing of the date of initial preparation and the date of each amendment in the SWPPP.

VIII. RISK DETERMINATION

The discharger shall calculate the site's sediment risk and receiving water risk during periods of soil exposure (i.e. grading and site stabilization) and use the calculated risks to determine a Risk Level(s) using the methodology in

Appendix 1. For any site that spans two or more planning watersheds,[13] the discharger shall calculate a separate Risk Level for each planning watershed. The discharger shall notify the State Water Board of the site's Risk Level determination(s) and shall include this determination as a part of submitting the PRDs. If a discharger ends up with more than one Risk Level determination, the Regional Water Board may choose to break the project into separate levels of implementation.

IX. RISK LEVEL 1 REQUIREMENTS

Risk Level 1 Dischargers shall comply with the requirements included in Attachment C of this General Permit.

X. RISK LEVEL 2 REQUIREMENTS

Risk Level 2 Dischargers shall comply with the requirements included in Attachment D of this General Permit.

XI. RISK LEVEL 3 REQUIREMENTS

Risk Level 3 Dischargers shall comply with the requirements included in Attachment E of this General Permit.

XII. ACTIVE TREATMENT SYSTEMS (ATS)

Dischargers choosing to implement an ATS on their site shall comply with all of the requirements in Attachment F of this General Permit.

[13] Planning watershed: defined by the Calwater Watershed documents as a watershed that ranges in size from approximately 3,000 to 10,000 acres http://cain.ice.ucdavis.edu/calwater/calwfaq.html, http://gis.ca.gov/catalog/BrowseRecord.epl?id=22175 .

XIII. POST-CONSTRUCTION STANDARDS

A. All dischargers shall comply with the following runoff reduction requirements unless they are located within an area subject to post-construction standards of an active Phase I or II municipal separate storm sewer system (MS4) permit that has an approved Storm Water Management Plan.

1. This provision shall take effect three years from the adoption date of this permit, or later at the discretion of the Executive Officer of the Regional Board.

2. The discharger shall demonstrate compliance with the requirements of this section by submitting with their NOI a map and worksheets in accordance with the instructions in Appendix 2. The discharger shall use non-structural controls unless the discharger demonstrates that non-structural controls are infeasible or that structural controls will produce greater reduction in water quality impacts.

3. The discharger shall, through the use of non-structural and structural measures as described in Appendix 2, replicate the pre-project water balance (for this permit, defined as the volume of rainfall that ends up as runoff) for the smallest storms up to the 85th percentile storm event (or the smallest storm event that generates runoff, whichever is larger). Dischargers shall inform Regional Water Board staff at least 30 days prior to the use of any structural control measure used to comply with this requirement. Volume that cannot be addressed using non-structural practices shall be captured in structural practices and approved by the Regional Water Board. When seeking Regional Board approval for the use of structural practices, dischargers shall document the infeasibility of using non-structural practices on the project site, or document that there will be fewer water quality impacts through the use of structural practices.

4. For sites whose disturbed area exceeds two acres, the discharger shall preserve the pre-construction drainage density (miles of stream length per square mile of drainage area) for all drainage areas within the area serving a first order stream[14] or larger stream and ensure that post-project time of runoff concentration is equal or greater than pre-project time of concentration.

[14] A first order stream is defined as a stream with no tributaries.

B. All dischargers shall implement BMPs to reduce pollutants in storm water discharges that are reasonably foreseeable after all construction phases have been completed at the site (Post-construction BMPs).

XIV. SWPPP REQUIREMENTS

A. The discharger shall ensure that the Storm Water Pollution Prevention Plans (SWPPPs) for all traditional project sites are developed and amended or revised by a QSD. The SWPPP shall be designed to address the following objectives:

1. All pollutants and their sources, including sources of sediment associated with construction, construction site erosion and all other activities associated with construction activity are controlled;

2. Where not otherwise required to be under a Regional Water Board permit, all non-storm water discharges are identified and either eliminated, controlled, or treated;

3. Site BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from construction activity to the BAT/BCT standard;

4. Calculations and design details as well as BMP controls for site run-on are complete and correct, and

5. Stabilization BMPs installed to reduce or eliminate pollutants after construction are completed.

B. To demonstrate compliance with requirements of this General Permit, the QSD shall include information in the SWPPP that supports the conclusions, selections, use, and maintenance of BMPs.

C. The discharger shall make the SWPPP available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, current copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone.

XV. REGIONAL WATER BOARD AUTHORITIES

A. In the case where the Regional Water Board does not agree with the discharger's self-reported risk level (e.g., they determine themselves to be a Level 1 Risk when they are actually a Level 2 Risk site), Regional Water Boards may either direct the discharger to reevaluate the Risk Level(s) for their site or terminate coverage under this General Permit.

B. Regional Water Boards may terminate coverage under this General Permit for dischargers who fail to comply with its requirements or where they determine that an individual NPDES permit is appropriate.

C. Regional Water Boards may require dischargers to submit a Report of Waste Discharge / NPDES permit application for Regional Water Board consideration of individual requirements.

D. Regional Water Boards may require additional Monitoring and Reporting Program Requirements, including sampling and analysis of discharges to sediment-impaired water bodies.

E. Regional Water Boards may require dischargers to retain records for more than the three years required by this General Permit.

XVI. ANNUAL REPORTING REQUIREMENTS

A. All dischargers shall prepare and electronically submit an Annual Report no later than September 1 of each year.

B. The discharger shall certify each Annual Report in accordance with the Special Provisions.

C. The discharger shall retain an electronic or paper copy of each Annual Report for a minimum of three years after the date the annual report is filed.

D. The discharger shall include storm water monitoring information in the Annual Report consisting of:

1. a summary and evaluation of all sampling and analysis results, including copies of laboratory reports;

2. the analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit");

3. a summary of all corrective actions taken during the compliance year;

4. identification of any compliance activities or corrective actions that were not implemented;

5. a summary of all violations of the General Permit;

6. the names of individual(s) who performed the facility inspections, sampling, visual observation (inspections), and/or measurements;

7. the date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge); and

8. the visual observation and sample collection exception records and reports specified in Attachments C, D, and E.

E. The discharger shall provide training information in the Annual Report consisting of:

1. documentation of all training for individuals responsible for all activities associated with compliance with this General Permit;

2. documentation of all training for individuals responsible for BMP installation, inspection, maintenance, and repair; and

3. documentation of all training for individuals responsible for overseeing, revising, and amending the SWPPP.

Linear Underground/ Overhead Requirements

A. DEFINITION OF LINEAR UNDERGROUND/OVERHEAD PROJECTS 1
B. LINEAR PROJECT PERMIT REGISTRATION DOCUMENTS (PRDs) 3
C. LINEAR PROJECT TERMINATION OF COVERAGE REQUIREMENTS..4
D. DISCHARGE PROHIBITIONS 6
E. SPECIAL PROVISIONS.....8
F. EFFLUENT STANDARDS & RECEIVING WATER MONITORING 13
G. RECEIVING WATER LIMITATIONS 16
H. TRAINING QUALIFICATIONS 17
I. TYPES OF LINEAR PROJECTS 19
J. LUP TYPE-SPECIFIC REQUIREMENTS 20
K. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) REQUIREMENTS 28
L. REGIONAL WATER BOARD AUTHORITIES.....29
M. MONITORING AND REPORTING REQUIREMENTS 31

All Linear Underground/Overhead project dischargers who submit permit registration documents (PRDs) indicating their intention to be regulated under the provisions of this General Permit shall comply with the following:

A. DEFINITION OF LINEAR UNDERGROUND/OVERHEAD PROJECTS

1. Linear Underground/Overhead Projects (LUPs) include, but are not limited to, any conveyance, pipe, or pipeline for the transportation of any gaseous, liquid (including water and wastewater for domestic municipal services), liquiescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio, or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to, (a) those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment, and associated ancillary facilities); and include, but are not limited to, (b) underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/tower pad and cable/wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/ or pavement repair or replacement, and stockpile/borrow locations.

2. LUP evaluation shall consist of two tasks:

a. Confirm that the project or project section(s) qualifies as an LUP. The State Water Board website contains a project determination guidance flowchart. http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

b. Identify which Type(s) (1, 2 or 3 described in Section I below) are applicable to the project or project sections based on project sediment and receiving water risk. (See Attachment A.1)

3. A Legally Responsible Person (LRP) for a Linear Underground/Overhead project is required to obtain CGP coverage under one or more permit registration document (PRD) electronic submittals to the State Water Board's Storm Water Multi-Application and Report Tracking (SMARTs) system. Attachment A.1 contains a flow chart to be used when determining if a linear project qualifies for coverage and to determine LUP Types. Since a LUP may be constructed within both developed and undeveloped locations and portions of LUPs may be constructed by different contractors, LUPs may be broken into logical permit sections. Sections may be determined based on portions of a project conducted by one contractor. Other situations may also occur, such as the time period in which the sections of a project will be constructed (e.g. project phases), for which separate permit coverage is possible. For projects that are broken into separate sections, a description of how each section relates to the overall project and the definition of the boundaries between sections shall be clearly stated.

4. Where construction activities transverse or enter into different Regional Water Board jurisdictions, LRPs shall obtain permit coverage for each Regional Water Board area involved prior to the commencement of construction activities.

5. Small Construction Rainfall Erosivity Waiver

EPA's Small Construction Erosivity Waiver applies to sites between one and five acres demonstrating that there are no adverse water quality impacts.

Dischargers eligible for a Rainfall Erosivity Waiver based on low erosivity potential shall complete the electronic Notice of Intent (NOI) and Sediment Risk form through the State Water Board's SMARTS system, certifying that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five. Where the LRP changes or another LRP is added during construction, the new LRP must also submit a waiver certification through the SMARTS system.

If a small linear construction site continues beyond the projected completion date given on the waiver certification, the LRP shall recalculate the rainfall erosivity factor for the new project duration and submit this information through the SMARTS system. If the new R factor is below five (5), the discharger shall update through SMARTS all applicable information on the waiver certification and retain a copy of the revised waiver onsite. The LRP shall submit the new waiver certification 30 days prior to the projected completion date listed on the original waiver form to assure exemption from permitting requirements is uninterrupted. If the new R factor is five (5) or above, the LRP shall be required to apply for coverage under this Order.

B. LINEAR PROJECT PERMIT REGISTRATION DOCUMENTS (PRDs)

Any information provided to the Regional Water Board shall comply with the Homeland Security Act and any other federal law that concerns security in the United States; any information that does not comply should not be submitted. PRDs shall consist of the following:

1. Notice of Intent (NOI)

Prior to construction activities, the LRP of a proposed linear underground/overhead project shall utilize the processes and methods provided in Attachment A.2, Permit Registration Documents (PRDs) – General Instructions for Linear Underground/Overhead Projects to comply with the Construction General Permit.

2. Site Maps

LRPs submitting PRDs shall include at least 3 maps. The first map will be a zoomed[1] 1000-1500 ft vicinity map that shows the starting point of the project. The second will be a zoomed map of 1000-1500 ft showing the ending location of the project. The third will be a larger view vicinity map, 1000 ft to 2000 ft, displaying the entire project location depending on the project size, and indicating the LUP type (1, 2 or 3) areas within the total project footprint.

3. Drawings

LRPs submitting PRDs shall include a construction drawing(s) or other appropriate drawing(s) or map(s) that shows the locations of storm drain

[1] An image with a close-up/enhanced detailed view of site features that show minute details such as streets and neighboring structures.
Or: An image with a close-up/enhanced detailed view of the site's surrounding infrastructure.
Or: An image with a close up detailed view of the project and its surroundings.

inlets and waterbodies[2] that may receive discharges from the construction activities and that shows the locations of BMPs to be installed for all those BMPs that can be illustrated on the revisable drawing(s) or map(s). If storm drain inlets, waterbodies, and/or BMPs cannot be adequately shown on the drawing(s) or map(s) they should be described in detail within the SWPPP.

4. Storm Water Pollution Prevention Plan (SWPPP)

LUP dischargers shall comply with the SWPPP Preparation, Implementation, and Oversight requirements in Section K of this Attachment.

5. Contact information

LUP dischargers shall include contact information for all contractors (or subcontractors) responsible for each area of an LUP project. This should include the names, telephone numbers, and addresses of contact personnel. Specific areas of responsibility of each contact, and emergency contact numbers should also be included.

6. In the case of a public emergency that requires immediate construction activities, a discharger shall submit a brief description of the emergency construction activity within five days of the onset of construction, and then shall submit all PRDs within thirty days.

C. LINEAR PROJECT TERMINATION OF COVERAGE REQUIREMENTS

The LRP may terminate coverage of an LUP when construction activities are completed by submitting an electronic notice of termination (NOT) through the State Water Board's SMARTS system. Termination requirements are different depending on the complexity of the LUP. An LUP is considered complete when: (a) there is no potential for construction-related storm water pollution; (b) all elements of the SWPPP have been completed; (c) construction materials and waste have been disposed of properly; (d) the site is in compliance with all local storm water management requirements; and (e) the LRP submits a notice of termination (NOT) and has received approval for termination from the appropriate Regional Water Board office.

1. LUP Stabilization Requirements

The LUP discharger shall ensure that all disturbed areas of the construction site are stabilized prior to termination of coverage under this General Permit. Final stabilization for the purposes of submitting an NOT

[2] Includes basin(s) that the MS4 storm sewer systems may drain to for Hydromodification or Hydrological Conditional of Concerns under the MS4 permits.

is satisfied when all soil disturbing activities are completed and one of the following criteria is met:

a. In disturbed areas that were vegetated prior to construction activities of the LUP, the area disturbed must be re-established to a uniform vegetative cover equivalent to 70 percent coverage of the preconstruction vegetative conditions. Where preconstruction vegetation covers less than 100 percent of the surface, such as in arid areas, the 70 percent coverage criteria is adjusted as follows: if the preconstruction vegetation covers 50 percent of the ground surface, 70 percent of 50 percent (.70 X .50=.35) would require 35 percent total uniform surface coverage; or

b. Where no vegetation is present prior to construction, the site is returned to its original line and grade and/or compacted to achieve stabilization; or

c. Equivalent stabilization measures have been employed. These measures include, but are not limited to, the use of such BMPs as blankets, reinforced channel liners, soil cement, fiber matrices, geotextiles, or other erosion resistant soil coverings or treatments.

2. LUP Termination of Coverage Requirements

The LRP shall file an NOT through the State Water Board's SMARTS system. By submitting an NOT, the LRP is certifying that construction activities for an LUP are complete and that the project is in full compliance with requirements of this General Permit and that it is now compliant with soil stabilization requirements where appropriate. Upon approval by the appropriate Regional Water Board office, permit coverage will be terminated.

3. Revising Coverage for Change of Acreage

When the LRP of a portion of an LUP construction project changes, or when a phase within a multi-phase project is completed, the LRP may reduce the total acreage covered by this General Permit. In reducing the acreage covered by this General Permit, the LRP shall electronically file revisions to the PRDs that include:

a. a revised NOI indicating the new project size;

b. a revised site map showing the acreage of the project completed, acreage currently under construction, acreage sold, transferred or added, and acreage currently stabilized.

c. SWPPP revisions, as appropriate; and

d. certification that any new LRPs have been notified of applicable requirements to obtain General Permit coverage. The certification shall include the name, address, telephone number, and e-mail address (if known) of the new LRP.

If the project acreage has increased, dischargers shall mail payment of revised annual fees within 14 days of receiving the revised annual fee notification.

D. DISCHARGE PROHIBITIONS

1. LUP dischargers shall not violate any discharge prohibitions contained in applicable Basin Plans or statewide water quality control plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan, unless granted an exception issued by the State Water Board.

2. LUP dischargers are prohibited from discharging non-storm water that is not otherwise authorized by this General Permit. Non-storm water discharges authorized by this General Permit[3] may include, fire hydrant flushing, irrigation of vegetative erosion control measures, pipe flushing and testing, water to control dust, street cleaning, dewatering,[4] uncontaminated groundwater from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board. Such discharges are allowed by this General Permit provided they are not relied upon to clean up failed or inadequate construction or post-construction BMPs designed to keep materials on site. These authorized non-storm water discharges:

[3] Dischargers must identify all authorized non-storm water discharges in the LUP's SWPPP and identify BMPs that will be implemented to either eliminate or reduce pollutants in non-storm water discharges. Regional Water Boards may direct the discharger to discontinue discharging such non-storm water discharges if determined that such discharges discharge significant pollutants or threaten water quality.
[4] Dewatering activities may be prohibited or need coverage under a separate permit issued by the Regional Water Boards. Dischargers shall check with the appropriate Regional Water Boards for any required permit or basin plan conditions prior to initial dewatering activities to land, storm drains, or waterbodies.

a. Shall not cause or contribute to a violation of any water quality standard;

b. Shall not violate any other provision of this General Permit;

c. Shall not violate any applicable Basin Plan;

d. Shall comply with BMPs as described in the SWPPP;

e. Shall not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants;

f. Shall be monitored and meets the applicable NALs; and

g. Shall be reported by the discharger in the Annual Report.

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not authorized by this General Permit to determine the need for a separate NPDES permit.

Additionally, some LUP dischargers may be required to obtain a separate permit if the applicable Regional Water Board has adopted a General Permit for dewatering discharges. Wherever feasible, alternatives, that do not result in the discharge of non-storm water, shall be implemented in accordance with this Attachment's Section K.2 - SWPPP Implementation Schedule.

3. LUP dischargers shall ensure that trench spoils or any other soils disturbed during construction activities that are contaminated[5] are not discharged with storm water or non-storm water discharges into any storm drain or water body except pursuant to an NPDES permit.

When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the LUP discharger shall have those soils sampled and tested to ensure that proper handling and public safety measures are

[5] Contaminated soil contains pollutants in concentrations that exceed the appropriate thresholds that various regulatory agencies set for those substances. Preliminary testing of potentially contaminated soils will be based on odor, soil discoloration, or prior history of the site's chemical use and storage and other similar factors. When soil contamination is found or suspected and a responsible party is not identified, or the responsible party fails to promptly take the appropriate action, the discharger shall have those soils sampled and tested to ensure proper handling and public safety measures are implemented. The legally responsible person will notify the appropriate local, State, or federal agency(ies) when contaminated soil is found at a construction site, and will notify the Regional Water Board by submitting an NOT at the completion of the project.

implemented. The LUP discharger shall notify the appropriate local, State, and federal agency(ies) when contaminated soil is found at a construction site, and will notify the appropriate Regional Water Board.

4. Discharging any pollutant-laden water that will cause or contribute to an exceedance of the applicable Regional Water Board's Basin Plan from a dewatering site or sediment basin into any receiving water or storm drain is prohibited.

5. Debris[6] resulting from construction activities are prohibited from being discharged from construction project sites.

E. SPECIAL PROVISIONS

1. Duty to Comply

a. The LUP discharger must comply with all of the conditions of this General Permit. Any permit noncompliance constitutes a violation of the Clean Water Act (CWA) and the Porter-Cologne Water Quality Control Act and is grounds for enforcement action and/or removal from General Permit coverage.

b. The LUP discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this General Permit has not yet been modified to incorporate the requirement.

2. General Permit Actions

a. This General Permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the discharger for a General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

[6] Litter, rubble, discarded refuse, and remains of something destroyed.

b. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the dischargers so notified.

3. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for an LUP discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

4. Duty to Mitigate

The LUP discharger shall take all responsible steps to minimize or prevent any discharge in violation of this General Permit, which has a reasonable likelihood of adversely affecting human health or the environment.

5. Proper Operation and Maintenance

The LUP discharger shall at all times properly operate and maintain any facilities and systems of treatment and control (and related appurtenances) which are installed or used by the discharger to achieve compliance with the conditions of this General Permit and with the requirements of the Storm Water Pollution Prevention Plan (SWPPP). Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a discharger when necessary to achieve compliance with the conditions of this General Permit.

6. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor does it authorize any infringement of Federal, State, or local laws or regulations.

7. Duty to Maintain Records and Provide Information

a. The LUP discharger shall maintain a paper or electronic copy of all required records, including a copy of this General Permit, for three years from the date generated or date submitted, whichever is last. These records shall be kept at the construction site or in a crew

member's vehicle until construction is completed, and shall be made available upon request.

b. The LUP discharger shall furnish the Regional Water Board, State Water Board, or USEPA, within a reasonable time, any requested information to determine compliance with this General Permit. The LUP discharger shall also furnish, upon request, copies of records that are required to be kept by this General Permit.

8. Inspection and Entry

The LUP discharger shall allow the Regional Water Board, State Water Board, USEPA, and/or, in the case of construction sites which discharge through a municipal separate storm sewer, an authorized representative of the municipal operator of the separate storm sewer system receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

a. Enter upon the discharger's premises at reasonable times where a regulated construction activity is being conducted or where records must be kept under the conditions of this General Permit;

b. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

c. Inspect at reasonable times the complete construction site, including any off-site staging areas or material storage areas, and the erosion/sediment controls; and

d. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

9. Electronic Signature and Certification Requirements

a. All Permit Registration Documents (PRDs) and Notices of Termination (NOTs) shall be electronically signed, certified, and submitted via SMARTS to the State Water Board. Either the Legally Responsible Person (LRP), as defined in Appendix 5 – Glossary, or a person legally authorized to sign and certify PRDs and NOTs on behalf of the LRP (the LRP's Approved Signatory, as defined in Appendix 5 - Glossary) must submit all information electronically via SMARTS.

b. Changes to Authorization. If an Approved Signatory's authorization is no longer accurate, a new authorization satisfying the requirements of paragraph (a) of this section must be submitted via SMARTS prior to or

together with any reports, information or applications to be signed by an Approved Signatory.

c. All SWPPP revisions, annual reports, or other information required by the General Permit (other than PRDs and NOTs) or requested by the Regional Water Board, State Water Board, USEPA, or local storm water management agency shall be certified and submitted by the LRP or the LRP's Approved Signatory.

10. Certification

Any person signing documents under Section E.9 above, shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

11. Anticipated Noncompliance

The LUP discharger shall give advance notice to the Regional Water Board and local storm water management agency of any planned changes in the construction activity, which may result in noncompliance with General Permit requirements.

12. Penalties for Falsification of Reports

Section 309(c)(4) of the CWA provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

13. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the discharger from any responsibilities, liabilities, or penalties to which the LUP discharger is or may be subject to under Section 311 of the CWA.

14. Severability

The provisions of this General Permit are severable; and, if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

15. Reopener Clause

This General Permit may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of USEPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

16. Penalties for Violations of Permit Conditions

a. Section 309 of the CWA provides significant penalties for any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the CWA or any permit condition or limitation implementing any such section in a permit issued under Section 402. Any person who violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[7] per calendar day of such violation, as well as any other appropriate sanction provided by Section 309 of the CWA.

b. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which in some cases are greater than those under the CWA.

17. Transfers

This General Permit is not transferable. A new LRP of an ongoing construction activity must submit PRDs in accordance with the requirements of this General Permit to be authorized to discharge under this General Permit. An LRP who is a property owner with active General Permit coverage who sells a fraction or all the land shall inform the new property owner(s) of the requirements of this General Permit.

18. Continuation of Expired Permit

This General Permit continues in force and effect until a new General Permit is issued or the SWRCB rescinds this General Permit. Only those

[7] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act

dischargers authorized to discharge under the expiring General Permit are covered by the continued General Permit.

F. EFFLUENT STANDARDS & RECEIVING WATER MONITORING

1. Narrative Effluent Limitations

a. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges regulated by this General Permit do not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

b. LUP dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of structural or non-structural controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

Table 1. Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level
pH	Field test with calibrated portable instrument	LUP Type 2	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
		LUP Type 3			lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	LUP Type 2	1	NTU	250 NTU
		LUP Type 3			250 NTU

2. Numeric Action Levels (NALs)

a. For LUP Type 2 and 3 dischargers, the lower storm event daily average NAL for pH is 6.5 pH units and the upper storm event daily average NAL for pH is 8.5 pH units. The LUP discharger shall take actions as described below if the storm event daily average discharge is outside of this range of pH values.

b. For LUP Type 2 and 3 dischargers, the storm event daily average NAL for turbidity is 250 NTU. The discharger shall take actions as described below if the storm event daily average discharge is outside of this range of turbidity values.

c. Whenever daily average analytical effluent monitoring results indicate that the discharge is below the lower NAL for pH, exceeds the upper NAL for pH, or exceeds the turbidity NAL (as listed in Table 1), the LUP discharger shall conduct a construction site and run-on evaluation to determine whether pollutant source(s) associated with the site's construction activity may have caused or contributed to the NAL exceedance and shall immediately implement corrective actions if they are needed.

d. The site evaluation will be documented in the SWPPP and specifically address whether the source(s) of the pollutants causing the exceedance of the NAL:

i Are related to the construction activities and whether additional BMPs or SWPPP implementation measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) determine what corrective action(s) were taken or will be taken and with a description of the schedule for completion.

AND/OR:

ii Are related to the run-on associated with the construction site location and whether additional BMPs or SWPPP implementation measures are required to (1) meet BAT/BCT requirements; (2) reduce or prevent pollutants in storm water discharges from causing exceedances of receiving water objectives; and (3) decide what corrective action(s) were taken or will be taken, including a description of the schedule for completion.

3. Receiving Water Monitoring Triggers

a. The receiving water monitoring triggers for LUP Type 3 dischargers with direct discharges to surface waters are triggered when the daily average effluent pH values during any site phase when there is a high risk of pH discharge[8] fall outside of the range of 6.0 and 9.0 pH units, or when the daily average effluent turbidity exceeds 500 NTU.

b. LUP Type 3 dischargers with direct discharges to surface waters shall conduct receiving water monitoring whenever their effluent monitoring results exceed the receiving water monitoring triggers. If the pH trigger is exceeded, the receiving water shall be monitored for pH for the duration of coverage under this General Permit. If the turbidity trigger is exceeded, the receiving water shall be monitored for turbidity and SSC for the duration of coverage under this General Permit.

c. LUP Type 3 dischargers with direct discharges to surfaces waters shall initiate receiving water monitoring when the triggers are exceeded unless the storm event causing the exceedance is determined after the fact to equal to or greater than the 5-year 24-hour storm (expressed in inches of rainfall) as determined by using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca5y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca5y24.gif

   Verification of the 5-year 24-hour storm event shall be done by reporting on-site rain gauge readings as well as nearby governmental rain gauge readings.

d. If run-on is caused by a forest fire or any other natural disaster, then receiving water monitoring triggers do not apply.

G. RECEIVING WATER LIMITATIONS

1. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges to any surface or ground water will not adversely affect human health or the environment.

2. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

3. LUP dischargers shall ensure that storm water discharges and authorized non-storm water discharges will not contain pollutants that cause or

[8] A period of high risk of pH discharge is defined as a project's complete utilities phase, complete vertical build phase, and any portion of any phase where significant amounts of materials are placed directly on the land at the site in a manner that could result in significant alterations of the background pH of the discharges.

contribute to an exceedance of any applicable water quality objectives or water quality standards (collectively, WQS) contained in a Statewide Water Quality Control Plan, the California Toxics Rule, the National Toxics Rule, or the applicable Regional Water Board's Water Quality Control Plan (Basin Plan).

H. TRAINING QUALIFICATIONS

1. General

All persons responsible for implementing requirements of this General Permit shall be appropriately trained. Training should be both formal and informal, occur on an ongoing basis, and should include training offered by recognized governmental agencies or professional organizations. Persons responsible for preparing, amending and certifying SWPPPs shall comply with the requirements in this Section H.

2. SWPPP Certification Requirements

a. **Qualified SWPPP Developer:** The LUP discharger shall ensure that all SWPPPs be written, amended and certified by a Qualified SWPPP Developer (QSD). A QSD shall have one of the following registrations or certifications, and appropriate experience, as required for:

i A California registered professional civil engineer;

ii A California registered professional geologist or engineering geologist;

iii A California registered landscape architect;

iv A professional hydrologist registered through the American Institute of Hydrology;

v A certified professional in erosion and sediment control (CPESC) ™ registered through Enviro Cert International, Inc;

vi A certified professional in storm water quality (CPSWQ)™ registered through Enviro Cert International, Inc.; or

vii A certified professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies (NICET).

Effective two years after the adoption date of this General Permit, a QSD shall have attended a State Water Board-sponsored or approved QSD training course.

b. The LUP discharger shall ensure that the SWPPP is written and amended, as needed, to address the specific circumstances for each construction site covered by this General Permit prior to commencement of construction activity for any stage.

c. The LUP discharger shall list the name and telephone number of the currently designated Qualified SWPPP Developer(s) in the SWPPP.

d. **Qualified SWPPP Practitioner:** The LUP discharger shall ensure that all elements of any SWPPP for each project will be implemented by a Qualified SWPPP Practitioner (QSP). A QSP is a person responsible for non-storm water and storm water visual observations, sampling and analysis, and for ensuring full compliance with the permit and implementation of all elements of the SWPPP. Effective two years from the date of adoption of this General Permit, a QSP shall be either a QSD or have one of the following certifications:

   i A certified erosion, sediment and storm water inspector registered through Certified Professional in Erosion and Sediment Control, Inc.; or

   ii A certified inspector of sediment and erosion control registered through Certified Inspector of Sediment and Erosion Control, Inc.

   Effective two years after the adoption date of this General Permit, a QSP shall have attended a State Water Board-sponsored or approved QSP training course.

e. The LUP discharger shall ensure that the SWPPP include a list of names of all contractors, subcontractors, and individuals who will be directed by the Qualified SWPPP Practitioner, and who is ultimately responsible for implementation of the SWPPP. This list shall include telephone numbers and work addresses. Specific areas of responsibility of each subcontractor and emergency contact numbers shall also be included.

f. The LUP discharger shall ensure that the SWPPP and each amendment be signed by the Qualified SWPPP Developer. The LUP discharger shall include a listing of the date of initial preparation and the dates of each amendment in the SWPPP.

I. TYPES OF LINEAR PROJECTS

This attachment establishes three types (Type 1, 2 & 3) of complexity for areas within an LUP or project section based on threat to water quality. Project area Types are determined through Attachment A.1.

The Type 1 requirements below establish the baseline requirements for all LUPs subject to this General Permit. Additional requirements for Type 2 and Type 3 LUPs are labeled.

1. Type 1 LUPs*:*

LUP dischargers with areas of a LUP designated as Type 1 shall comply with the requirements in this Attachment. Type 1 LUPs are:

a. Those construction areas where 70 percent or more of the construction activity occurs on a paved surface and where areas disturbed during construction will be returned to preconstruction conditions or equivalent protection established at the end of the construction activities for the day; or

b. Where greater than 30 percent of construction activities occur within the non-paved shoulders or land immediately adjacent to paved surfaces, or where construction occurs on unpaved improved roads, including their shoulders or land immediately adjacent to them where:

   i Areas disturbed during construction will be returned to preconstruction conditions or equivalent protection is established at the end of the construction activities for the day to minimize the potential for erosion and sediment deposition, and

   ii Areas where established vegetation was disturbed during construction will be stabilized and re-vegetated by the end of project. When required, adequate temporary stabilization BMPs will be installed and maintained until vegetation is established to meet minimum cover requirements established in this General Permit for final stabilization.

c. Where the risk determination is as follows:

   i Low sediment risk, low receiving water risk, or

   ii Low sediment risk, medium receiving water risk, or

   iii Medium sediment risk, low receiving water risk

2. Type 2 LUPs:

Type 2 LUPs are determined by the Combined Risk Matrix in Attachment A.1. Type 2 LUPs have the specified combination of risk:

d. High sediment risk, low receiving water risk, or

e. Medium sediment risk, medium receiving water risk, or

f. Low sediment risk, high receiving water risk

Receiving water risk is either considered "Low" for those areas of the project that are not in close proximity to a sensitive receiving watershed, "Medium" for those areas of the project within a sensitive receiving watershed yet outside of the flood plain of a sensitive receiving water body, and "High" where the soil disturbance is within close proximity to a sensitive receiving water body. Project sediment risk is calculated based on the Risk Factor Worksheet in Attachment C of this General Permit.

3. Type 3 LUPs:

Type 3 LUPs are determined by the Combined Risk Matrix in Attachment A.1. Type 3 LUPs have the specified combination of risk:

a. High sediment risk, high receiving water risk, or

b. High sediment risk, medium receiving water risk, or

c. Medium sediment risk, high receiving water risk

Receiving water risk is either considered "Medium" for those areas of the project within a sensitive receiving watershed yet outside of the flood plain of a sensitive receiving water body, or "High" where the soil disturbance is within close proximity to a sensitive receiving water body. Project sediment risk is calculated based on the Risk Factor Worksheet in Attachment C.

J. LUP TYPE-SPECIFIC REQUIREMENTS

1. Effluent Standards

a. Narrative – LUP dischargers shall comply with the narrative effluent standards below.

i Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

ii LUP dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

b. Numeric – LUP Type 1 dischargers are not subject to a numeric effluent standard

c. Numeric –LUP Type 2 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

d. Numeric – LUP Type 3 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

2. Good Site Management "Housekeeping"

a. LUP dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, the good housekeeping measures shall consist of the following:

i Identify the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

ii Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

iii Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

iv Minimize exposure of construction materials to precipitation (not applicable to materials designed to be outdoors and exposed to the environment).

v Implement BMPs to control the off-site tracking of loose construction and landscape materials.

b. LUP dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

i Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

ii Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

iii Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

iv Cover waste disposal containers at the end of every business day and during a rain event.

v Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

vi Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

vii Implement procedures that effectively address hazardous and non-hazardous spills.

viii Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

(1) Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

(2) Appropriate spill response personnel are assigned and trained.

ix Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

c. LUP dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   i Prevent oil, grease, or fuel from leaking into the ground, storm drains or surface waters.

   ii Implement appropriate BMPs whenever equipment or vehicles are fueled, maintained or stored.

   iii Clean leaks immediately and disposing of leaked materials properly.

d. LUP dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   i Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   ii Contain fertilizers and other landscape materials when they are not actively being used.

   iii Discontinue the application of any erodible landscape material at least 2 days before a forecasted rain event[9] or during periods of precipitation.

   iv Applying erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   v Stacking erodible landscape material on pallets and covering or storing such materials when not being used or applied.

e. LUP dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, LUP dischargers shall do the following:

[9] 50% or greater chance of producing precipitation.

i Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

ii Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

iii Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

iv Ensure retention of sampling, visual observation, and inspection records.

v Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

f. LUP dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations.

3. Non-Storm Water Management

a. LUP dischargers shall implement measures to control all non-storm water discharges during construction.

b. LUP dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

c. LUP dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

4. Erosion Control

a. LUP dischargers shall implement effective wind erosion control.

b. LUP dischargers shall provide effective soil cover for inactive[10] areas and all finished slopes, and utility backfill.

[10] Areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days

c. LUP dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

5. Sediment Controls

a. LUP dischargers shall establish and maintain effective perimeter controls as needed, and implement effective BMPs for all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

b. On sites where sediment basins are to be used, LUP dischargers shall, at minimum, design sediment basins according to the guidance provided in CASQA's Construction BMP Handbook.

c. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[11] in accordance with Table 2 below.

Table 2 – Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

d. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent off-site tracking of sediment.

e. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

f. **Additional LUP Type 2 & 3 Requirement:** LUP Type 2 & 3 dischargers shall inspect all immediate access roads. At a minimum daily and prior to any rain event, the discharger shall remove any

[11] Sheet flow length is the length that shallow, low velocity flow travels across a site.

sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

g. **Additional LUP Type 3 Requirement:** The Regional Water Board may require LUP Type 3 dischargers to implement additional site-specific sediment control requirements if the implementation of the other requirements in this section are not adequately protecting the receiving waters.

6. Run-on and Run-off Controls

a. LUP dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site-shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this Attachment.

b. Run-on and runoff controls are not required for Type 1 LUPs unless the evaluation of quantity and quality of run-on and runoff deems them necessary or visual inspections show that the site requires such controls.

7. Inspection, Maintenance and Repair

a. All inspection, maintenance repair and sampling activities at the discharger's LUP location shall be performed or supervised by a QSP representing the discharger. The QSP may delegate any or all of these activities to an employee trained to do the task(s) appropriately, but shall ensure adequate deployment.

b. LUP dischargers shall conduct visual inspections and observations daily during working hours (not recorded). At least once each 24-hour period during extended storm events, **LUP Type 2 & 3 dischargers** shall conduct visual inspections to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

c. Upon identifying failures or other shortcomings, as directed by the QSP, LUP dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

d. For each pre- and post-rain event inspection required, LUP dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format that includes the information described below.

e. The LUP discharger shall ensure that the checklist remains on-site or with the SWPPP. At a minimum, an inspection checklist should include:

i Inspection date and date the inspection report was written.

ii Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

iii Site information, including stage of construction, activities completed, and approximate area of the site exposed.

iv A description of any BMPs evaluated and any deficiencies noted.

v If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

vi Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

vii Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

viii Photographs taken during the inspection, if any.

ix Inspector’s name, title, and signature.

K. STORM WATER POLLUTION PREVENTION PLAN (SWPPP) REQUIREMENTS

1. Objectives

SWPPPs for all LUPs shall be developed and amended or revised by a QSD. The SWPPP shall be designed to address the following objectives:

a. All pollutants and their sources, including sources of sediment, associated with construction activities associated with LUP activity are controlled;

b. All non-storm water discharges are identified and either eliminated, controlled, or treated;

c. BMPs are effective and result in the reduction or elimination of pollutants in storm water discharges and authorized non-storm water discharges from LUPs during construction; and

d. Stabilization BMPs installed to reduce or eliminate pollutants after construction is completed are effective and maintained.

2. SWPPP Implementation Schedule

a. LUPs for which PRDs have been submitted to the State Water Board shall develop a site/project location SWPPP prior to the start of land-disturbing activity in accordance with this Section and shall implement the SWPPP concurrently with commencement of soil-disturbing activities.

b. For an ongoing LUP involving a change in the LRP, the new LRP shall review the existing SWPPP and amend it, if necessary, or develop a new SWPPP within 15 calendar days to conform to the requirements set forth in this General Permit.

3. Availability

The SWPPP shall be available at the construction site during working hours while construction is occurring and shall be made available upon request by a State or Municipal inspector. When the original SWPPP is retained by a crewmember in a construction vehicle and is not currently at the construction site, copies of the BMPs and map/drawing will be left with the field crew and the original SWPPP shall be made available via a request by radio/telephone.

L. REGIONAL WATER BOARD AUTHORITIES

1. Regional Water Boards shall administer the provisions of this General Permit. Administration of this General Permit may include, but is not limited to, requesting the submittal of SWPPPs, reviewing SWPPPs, reviewing monitoring and sampling and analysis reports, conducting compliance inspections, gathering site information by any medium including sampling, photo and video documentation, and taking enforcement actions.

2. Regional Water Boards may terminate coverage under this General Permit for dischargers who fail to comply with its requirements or where they determine that an individual NPDES permit is appropriate.

3. Regional Water Boards may issue separate permits for discharges of storm water associated with construction activity to individual dischargers, categories of dischargers, or dischargers in a geographic area. Upon issuance of such permits by a Regional Water Board, dischargers subject to those permits shall no longer be regulated by this General Permit.

4. Regional Water Boards may direct the discharger to reevaluate the LUP Type(s) for the project (or elements/areas of the project) and impose the appropriate level of requirements.

5. Regional Water Boards may terminate coverage under this General Permit for dischargers who negligently or with willful intent incorrectly determine or report their LUP Type (e.g., they determine themselves to be a LUP Type 1 when they are actually a Type 2).

6. Regional Water Boards may review PRDs and reject or accept applications for permit coverage or may require dischargers to submit a Report of Waste Discharge / NPDES permit application for Regional Water Board consideration of individual requirements.

7. Regional Water Boards may impose additional requirements on dischargers to satisfy TMDL implementation requirements or to satisfy provisions in their Basin Plans.

8. Regional Water Boards may require additional Monitoring and Reporting Program Requirements, including sampling and analysis of discharges to sediment-impaired water bodies.

9. Regional Water Boards may require dischargers to retain records for more than the three years required by this General Permit.

10. Based on an LUP's threat to water quality and complexity, the Regional Water Board may determine on a case-by-case basis that an LUP, or a portion of an LUP, is not eligible for the linear project requirements contained in this Attachment, and require that the discharger comply with all standard requirements in this General Permit.

11. The Regional Water Board may require additional monitoring and reporting program requirements including sampling and analysis of discharges to CWA § 303(d)-listed water bodies. Additional requirements imposed by the Regional Water Board shall be consistent with the overall monitoring effort in the receiving waters.

M. MONITORING AND REPORTING REQUIREMENTS

Table 3. LUP Summary of Monitoring Requirements

LUP Type	Visual Inspections				Sample Collection		
	Daily Site BMP	Pre-storm Event: Baseline	Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water	Non-Visible (when applicable)
1	X						X
2	X	X	X	X	X		X
3	X	X	X	X	X	X	X

1. Objectives

LUP dischargers shall prepare a monitoring and reporting program (M&RP) prior to the start of construction and immediately implement the program at the start of construction for LUPs. The monitoring program must be implemented at the appropriate level to protect water quality at all times throughout the life of the project. The M&RP must be a part of the SWPPP, included as an appendix or separate SWPPP chapter.

2. M&RP Implementation Schedule

a. LUP dischargers shall implement the requirements of this Section at the time of commencement of construction activity. LUP dischargers are responsible for implementing these requirements until construction activity is complete and the site is stabilized.

b. LUP dischargers shall revise the M&RP when:

i Site conditions or construction activities change such that a change in monitoring is required to comply with the requirements and intent of this General Permit.

ii The Regional Water Board requires the discharger to revise its M&RP based on its review of the document. Revisions may include, but not be limited to, conducting additional site inspections, submitting reports, and certifications. Revisions shall be submitted via postal mail or electronic e-mail.

iii The Regional Water Board may require additional monitoring and reporting program requirements including sampling and analysis of discharges to CWA § 303(d)-listed water bodies. Additional requirements imposed by the Regional Water Board shall be consistent with the overall monitoring effort in the receiving waters.

3. LUP Type 1 Monitoring and Reporting Requirements

a. LUP Type 1 Inspection Requirements

i LUP Type 1 dischargers shall ensure that all inspections are conducted by trained personnel. The name(s) and contact number(s) of the assigned inspection personnel should be listed in the SWPPP.

ii LUP Type 1 dischargers shall ensure that all visual inspections are conducted daily during working hours and in conjunction with other daily activities in areas where active construction is occurring.

iii LUP Type 1 dischargers shall ensure that photographs of the site taken before, during, and after storm events are taken during inspections, and submitted through the State Water Board's SMARTS website once every three rain events.

iv LUP Type 1 dischargers shall conduct daily visual inspections to verify that:

(1) Appropriate BMPs for storm water and non-storm water are being implemented in areas where active construction is occurring (including staging areas);

(2) Project excavations are closed, with properly protected spoils, and that road surfaces are cleaned of excavated material and construction materials such as chemicals by either removing or storing the material in protective storage containers at the end of every construction day;

(3) Land areas disturbed during construction are returned to pre-construction conditions or an equivalent protection is used at the end of each workday to eliminate or minimize erosion and the possible discharge of sediment or other pollutants during a rain event.

v Inspections may be discontinued in non-active construction areas where soil-disturbing activities are completed and final soil stabilization is achieved (e.g., paving is completed, substructures

are installed, vegetation meets minimum cover requirements for final stabilization, or other stabilization requirements are met).

vi Inspection programs are required for LUP Type 1 projects where temporary and permanent stabilization BMPs are installed and are to be monitored after active construction is completed. Inspection activities shall continue until adequate permanent stabilization is established and, in areas where re-vegetation is chosen, until minimum vegetative coverage is established in accordance with Section C.1 of this Attachment.

b. LUP Type 1 Monitoring Requirements for Non-Visible Pollutants

LUP Type 1 dischargers shall implement sampling and analysis requirements to monitor non-visible pollutants associated with (1) construction sites; (2) activities producing pollutants that are not visually detectable in storm water discharges; and (3) activities which could cause or contribute to an exceedance of water quality objectives in the receiving waters.

i Sampling and analysis for non-visible pollutants is only required where the LUP Type 1 discharger believes pollutants associated with construction activities have the potential to be discharged with storm water runoff due to a spill or in the event there was a breach, malfunction, failure and/or leak of any BMP. Also, failure to implement BMPs may require sample collection.

(1) Visual observations made during the monitoring program described above will help the LUP Type 1 discharger determine when to collect samples.

(2) The LUP Type 1 discharger is not required to sample if one of the conditions described above (e.g., breach or spill) occurs and the site is cleaned of material and pollutants and/or BMPs are implemented prior to the next storm event.

ii LUP Type 1 dischargers shall collect samples down-gradient from all discharge locations where the visual observations were made triggering the monitoring, and which can be safely accessed. For sites where sampling and analysis is required, personnel trained in water quality sampling procedures shall collect storm water samples.

iii If sampling for non-visible pollutant parameters is required, LUP Type 1 dischargers shall ensure that samples be analyzed for parameters indicating the presence of pollutants identified in the pollutant source assessment required in Section J.2.a.i.

iv LUP Type 1 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

v LUP Type 1 dischargers shall ensure that a sufficiently large sample of storm water that has not come into contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample[12]) will be collected for comparison with the discharge sample. Samples shall be collected during the first two hours of discharge from rain events that occur during daylight hours and which generate runoff.

vi LUP Type 1 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis. Analyses may include, but are not limited to, indicator parameters such as: pH, specific conductance, dissolved oxygen, conductivity, salinity, and Total Dissolved Solids (TDS).

vii For laboratory analyses, all sampling, sample preservation, and other analyses must be conducted according to test procedures pursuant to 40 C.F.R. Part 136. LUP Type 1 dischargers shall ensure that field samples are collected and analyzed according to manufacturer specifications of the sampling devices employed. Portable meters shall be calibrated according to manufacturer's specification.

viii LUP Type 1 dischargers shall ensure that all field and/or analytical data are kept in the SWPPP document.

c. LUP Type 1 Visual Observation Exceptions

i LUP Type 1 dischargers shall be prepared to collect samples and conduct visual observation (inspections) to meet the minimum visual observation requirements of this Attachment. The Type 1 LUP discharger is not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

(1) During dangerous weather conditions such as flooding and electrical storms;

(2) Outside of scheduled site business hours.

(3) When access to the site is unsafe due to storm events.

[12] Sample collected at a location unaffected by contruction activities.

ii If the LUP Type 1 discharger does not collect the required samples or visual observation (inspections) due to these exceptions, an explanation why the sampling or visual observation (inspections) were not conducted shall be included in both the SWPPP and the Annual Report.

d. Particle Size Analysis for Risk Justification

LUP Type 1 dischargers utilizing justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

4. LUP Type 2 & 3 Monitoring and Reporting Requirements

a. LUP Type 2 & 3 Inspection Requirements

i LUP Type 2 & 3 dischargers shall ensure that all inspections are conducted by trained personnel. The name(s) and contact number(s) of the assigned inspection personnel should be listed in the SWPPP.

ii LUP Type 2 & 3 dischargers shall ensure that all visual inspections are conducted daily during working hours and in conjunction with other daily activities in areas where active construction is occurring.

iii LUP Type 2 & 3 dischargers shall ensure that photographs of the site taken before, during, and after storm events are taken during inspections, and submitted through the State Water Board's SMARTS website once every three rain events.

iv LUP Type 2 & 3 dischargers shall conduct daily visual inspections to verify that appropriate BMPs for storm water and non-storm water are being implemented and in place in areas where active construction is occurring (including staging areas).

v LUP Type 2 & 3 dischargers shall conduct inspections of the construction site prior to anticipated storm events, during extended storm events, and after actual storm events to identify areas contributing to a discharge of storm water associated with construction activity. Pre-storm inspections are to ensure that BMPs are properly installed and maintained; post-storm inspections are to assure that BMPs have functioned adequately. During

extended storm events, inspections shall be required during normal working hours for each 24-hour period.

vi Inspections may be discontinued in non-active construction areas where soil-disturbing activities are completed and final soil stabilization is achieved (e.g., paving is completed, substructures are installed, vegetation meets minimum cover requirements for final stabilization, or other stabilization requirements are met).

vii LUP Type 2 & 3 dischargers shall implement a monitoring program for inspecting projects that require temporary and permanent stabilization BMPs after active construction is complete. Inspections shall ensure that the BMPs are adequate and maintained. Inspection activities shall continue until adequate permanent stabilization is established and, in vegetated areas, until minimum vegetative coverage is established in accordance with Section C.1 of this Attachment.

viii If possible, LUP Type 2 & 3 dischargers shall install a rain gauge on-site at an accessible and secure location with readings made during all storm event inspections. When readings are unavailable, data from the closest rain gauge with publically available data may be used.

ix LUP Type 2 & 3 dischargers shall Include and maintain a log of the inspections conducted in the SWPPP. The log will provide the date and time of the inspection and who conducted the inspection.

b. LUP Type 2 & 3 Storm Water Effluent Monitoring Requirements

Table 4. LUP Type 2 & 3 Effluent Monitoring Requirements

LUP Type	Frequency	Effluent Monitoring
2	Minimum of 3 samples per day characterizing discharges associated with construction activity from the project active areas of construction.	Turbidity, pH, and non-visible pollutant parameters (if applicable)
3	Minimum of 3 samples per day characterizing discharges associated with construction activity from the project active areas of construction.	turbidity, pH, and non-visible pollutant parameters (if applicable)

i LUP Type 2 & 3 dischargers shall collect storm water grab samples from sampling locations characterizing discharges associated with activity from the LUP active areas of construction. At a minimum, 3 samples shall be collected per day of discharge.

ii LUP Type 2 & 3 dischargers shall collect samples of stored or contained storm water that is discharged subsequent to a storm event producing precipitation of ½ inch or more at the time of discharge.

iii LUP Type 2 & 3 dischargers shall ensure that storm water grab sample(s) obtained be representative of the flow and characteristics of the discharge.

iv LUP Type 2 & 3 dischargers shall analyze their effluent samples for:

(1) pH and turbidity
(2) Any additional parameter for which monitoring is required by the Regional Water Board.

c. LUP Type 2 & 3 Storm Water Effluent Sampling Locations

i LUP Type 2 & 3 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire disturbed project or area.

ii LUP Type 2 & 3 dischargers may monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to exceedance of NALs.

iii LUP Type 2 & 3 dischargers shall select analytical test methods from the list provided in Table 5 below.

iv LUP Type 2 & 3 dischargers shall ensure that all storm water sample collection preservation and handling shall be conducted in accordance with the “Storm Water Sample Collection and Handling Instructions” below.

d. LUP Type 3 Receiving Water Monitoring Requirements

i In the event that an LUP Type 3 discharger’s effluent exceeds the receiving water monitoring triggers of 500 NTU turbidity or pH range of 6.0-9.0, contained in this General Permit and has a direct discharge to receiving waters, the LUP discharger shall subsequently sample Receiving Waters (RWs) for turbidity, pH (if applicable) and SSC for the duration of coverage under this General Permit. In the event that an LUP Tupe 3 discharger utilizing ATS with direct discharges into receiving waters discharges effluent that exceeds the NELs in this permit, the discharger shall

subsequently sample RWs for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit.

ii LUP Type 3 dischargers that meet the project criteria in Appendix 3 of this General Permit and have more than 30 acres of soil disturbance in the project area or project section area designated as Type 3, shall comply with the Bioassessment requirements prior to commencement of construction activity.

iii LUP Type 3 dischargers shall obtain RW samples in accordance with the requirements of the Receiving Water Sampling Locations section (Section M.4.c. of this Attachment).

e. LUP Type 3 Receiving Water Sampling Locations

i **Upstream/up-gradient RW samples**: LUP Type 3 dischargers shall obtain any required upstream/up-gradient receiving water samples from a representative and accessible location as close as possible to and upstream from the effluent discharge point.

ii **Downstream/down-gradient RW samples**: LUP Type 3 dischargers shall obtain any required downstream/down-gradient receiving water samples from a representative and accessible location as close as possible to and downstream from the effluent discharge point.

iii If two or more discharge locations discharge to the same receiving water, LUP Type 3 dischargers may sample the receiving water at a single upstream and downstream location.

f. LUP Type 2 & 3 Monitoring Requirements for Non-Visible Pollutants

LUP Type 2 & 3 dischargers shall implement sampling and analysis requirements to monitor non-visible pollutants associated with (1) construction sites; (2) activities producing pollutants that are not visually detectable in storm water discharges; and (3) activities which could cause or contribute to an exceedance of water quality objectives in the receiving waters.

i Sampling and analysis for non-visible pollutants is only required where LUP Type 2 & 3 dischargers believe pollutants associated with construction activities have the potential to be discharged with storm water runoff due to a spill or in the event there was a breach, malfunction, failure and/or leak of any BMP. Also, failure to implement BMPs may require sample collection.

(1) Visual observations made during the monitoring program described above will help LUP Type 2 & 3 dischargers determine when to collect samples.

(2) LUP Type 2 & 3 dischargers are not required to sample if one of the conditions described above (e.g., breach or spill) occurs and the site is cleaned of material and pollutants and/or BMPs are implemented prior to the next storm event.

ii LUP Type 2 & 3 dischargers shall collect samples down-gradient from the discharge locations where the visual observations were made triggering the monitoring and which can be safely accessed. For sites where sampling and analysis is required, personnel trained in water quality sampling procedures shall collect storm water samples.

iii If sampling for non-visible pollutant parameters is required, LUP Type 2 & 3 dischargers shall ensure that samples be analyzed for parameters indicating the presence of pollutants identified in the pollutant source assessment required in Section J.2.a.i.

iv LUP Type 2 & 3 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

v LUP Type 2 & 3 dischargers shall ensure that a sufficiently large sample of storm water that has not come into contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample[13]) will be collected for comparison with the discharge sample. Samples shall be collected during the first two hours of discharge from rain events that occur during daylight hours and which generate runoff.

vi LUP Type 2 & 3 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis. Analyses may include, but are not limited to, indicator parameters such as: pH, specific conductance, dissolved oxygen, conductivity, salinity, and Total Dissolved Solids (TDS).

vii For laboratory analyses, all sampling, sample preservation, and other analyses must be conducted according to test procedures pursuant to 40 C.F.R. Part 136. LUP Type 2 & 3 dischargers shall ensure that field samples are collected and analyzed according to manufacturer specifications of the sampling devices employed.

[13] Sample collected at a location unaffected by construction activities

Portable meters shall be calibrated according to manufacturer's specification.

viii LUP Type 2 & 3 dischargers shall ensure that all field and/or analytical data are kept in the SWPPP document.

g. LUP Type 2 & 3 Visual Observation and Sample Collection Exceptions

i LUP Type 2 & 3 dischargers shall be prepared to collect samples and conduct visual observation (inspections) to meet the minimum visual observation requirements of this Attachment. Type 2 & 3 LUP dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

(1) During dangerous weather conditions such as flooding and electrical storms;

(2) Outside of scheduled site business hours.

(3) When access to the site is unsafe due to storm events.

ii If the LUP Type 2 or 3 discharger does not collect the required samples or visual observation (inspections) due to these exceptions, an explanation why the sampling or visual observation (inspections) were not conducted shall be included in both the SWPPP and the Annual Report.

h. LUP Type 2 & 3 Storm Water Sample Collection and Handling Instructions

LUP Type 2 & 3 dischargers shall refer to Table 5 below for test Methods, detection Limits, and reporting Units. During storm water sample collection and handling, the LUP Type 2 & 3 discharger shall:

i Identify the parameters required for testing and the number of storm water discharge points that will be sampled. Request the laboratory to provide the appropriate number of sample containers, types of containers, sample container labels, blank chain of custody forms, and sample preservation instructions.

ii Determine how to ship the samples to the laboratory. The testing laboratory should receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory). The options are to either deliver the samples to the laboratory, arrange to have the laboratory pick them up, or ship them overnight to the laboratory.

iii Use only the sample containers provided by the laboratory to collect and store samples. Use of any other type of containers could contaminate your samples.

iv Prevent sample contamination, by not touching, or putting anything into the sample containers before collecting storm water samples.

v Not overfilling sample containers. Overfilling can change the analytical results.

vi Tightly screw the cap of each sample container without stripping the threads of the cap.

vii Complete and attach a label to each sample container. The label shall identify the date and time of sample collection, the person taking the sample, and the sample collection location or discharge point. The label should also identify any sample containers that have been preserved.

viii Carefully pack sample containers into an ice chest or refrigerator to prevent breakage and maintain temperature during shipment. Remember to place frozen ice packs into the shipping container. Samples should be kept as close to 4° C (39° F) as possible until arriving at the laboratory. Do not freeze samples.

ix Complete a Chain of Custody form for each set of samples. The Chain of Custody form shall include the discharger's name, address, and phone number, identification of each sample container and sample collection point, person collecting the samples, the date and time each sample container was filled, and the analysis that is required for each sample container.

x Upon shipping/delivering the sample containers, obtain both the signatures of the persons relinquishing and receiving the sample containers.

xi Designate and train personnel to collect, maintain, and ship samples in accordance with the above sample protocols and good laboratory practices.

xii Refer to the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP) for more

information on sampling collection and analysis. See http://www.waterboards.ca.gov/water_issues/programs/swamp/[14]

Table 5. Test Methods, Detection Limits, Reporting Units and Applicable NALs

Parameter	Test Method	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Levels	(LUP Type 3) Receiving Water Monitoring Trigger
pH	Field test with calibrated portable instrument	Type 2 & 3	0.2	pH units	Lower = 6.5 upper = 8.5	Lower = 6.0 upper = 9.0
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Type 2 & 3	1	NTU	250 NTU	500 NTU
SSC	ASTM Method D 3977-97[15]	Type 3 if Receiving Water Monitoring Trigger is exceeded	5	Mg/L	N/A	N/A
Bioassessment	(STE) Level I of (SAFIT),[16] fixed-count of 600 org/sample	Type 3 LUPs > 30 acres	N/A	N/A	N/A	N/A

i. LUP Type 2 & 3 Monitoring Methods

i The LUP Type 2 or 3 discharger's project M&RP shall include a description of the following items:

(1) Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

[14] Additional information regarding SWAMP's QAPrP can be found at: http://www.waterboards.ca.gov/water_issues/programs/swamp/.

[15] ASTM, 1999, Standard Test Method for Determining Sediment Concentration in Water Samples: American Society of Testing and Materials, D 3977-97, Vol. 11.02, pp. 389-394

[16] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

(2) Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program a copy of the Chain of Custody form used when handling and shipping samples.

(3) Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section M.4.f above.

ii LUP Type 2 & 3 dischargers shall ensure that all sampling and sample preservation be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) shall be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. All laboratory analyses shall be conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses shall be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services (SSC exception). The LUP discharger shall conduct its own field analysis of pH and may conduct its own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

j. LUP Type 2 & 3 Analytical Methods

LUP Type 2 & 3 dischargers shall refer to Table 5 above for test Methods, detection Limits, and reporting Units.

i **pH**: LUP Type 2 & 3 dischargers shall perform pH analysis on-site with a calibrated pH meter or pH test kit. The LUP discharger shall record pH monitoring results on paper and retain these records in accordance with Section M.4.o, below.

ii **Turbidity**: LUP Type 2 & 3 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results shall

be recorded in the site log book in Nephelometric Turbidity Units (NTU).

iii **Suspended sediment concentration (SSC)**: LUP Type 3 dischargers exceeding the turbidity Receiving Water Monitoring Trigger, shall perform SSC analysis using ASTM Method D3977-97.

iv **Bioassessment**: LUP Type 3 dischargers shall perform bioassessment sampling and analysis according to Appendix 3 of this General Permit.

k. Watershed Monitoring Option

If an LUP Type 2 or 3 discharger is part of a qualified regional watershed-based monitoring program the LUP Type 2 or 3 discharger may be eligible for relief from the monitoring requirements in this Attachment. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program if it determines that the watershed-based monitoring program will provide information to determine each discharger's compliance with the requirements of this General Permit.

l. Particle Size Analysis for Risk Justification

LUP Type 2 & 3 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

m. NAL Exceedance Report

i In the event that any effluent sample exceeds an applicable NAL, the Regional Water Boards may require LUP Type 2 & 3 dischargers to submit NAL Exceedance Reports.

ii LUP Type 2 & 3 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

iii LUP Type 2 & 3 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the exceedance report is filed.

iv LUP Type 2 & 3 dischargers shall include in the NAL Exceedance Report:

(1) the analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit"); and
(2) the date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.
(3) Description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

n. Monitoring Records

LUP Type 2 & 3 dischargers shall ensure that records of all storm water monitoring information and copies of all reports (including Annual Reports) required by this General Permit be retained for a period of at least three years. LUP Type 2 & 3 dischargers may retain records off-site and make them available upon request. These records shall include:

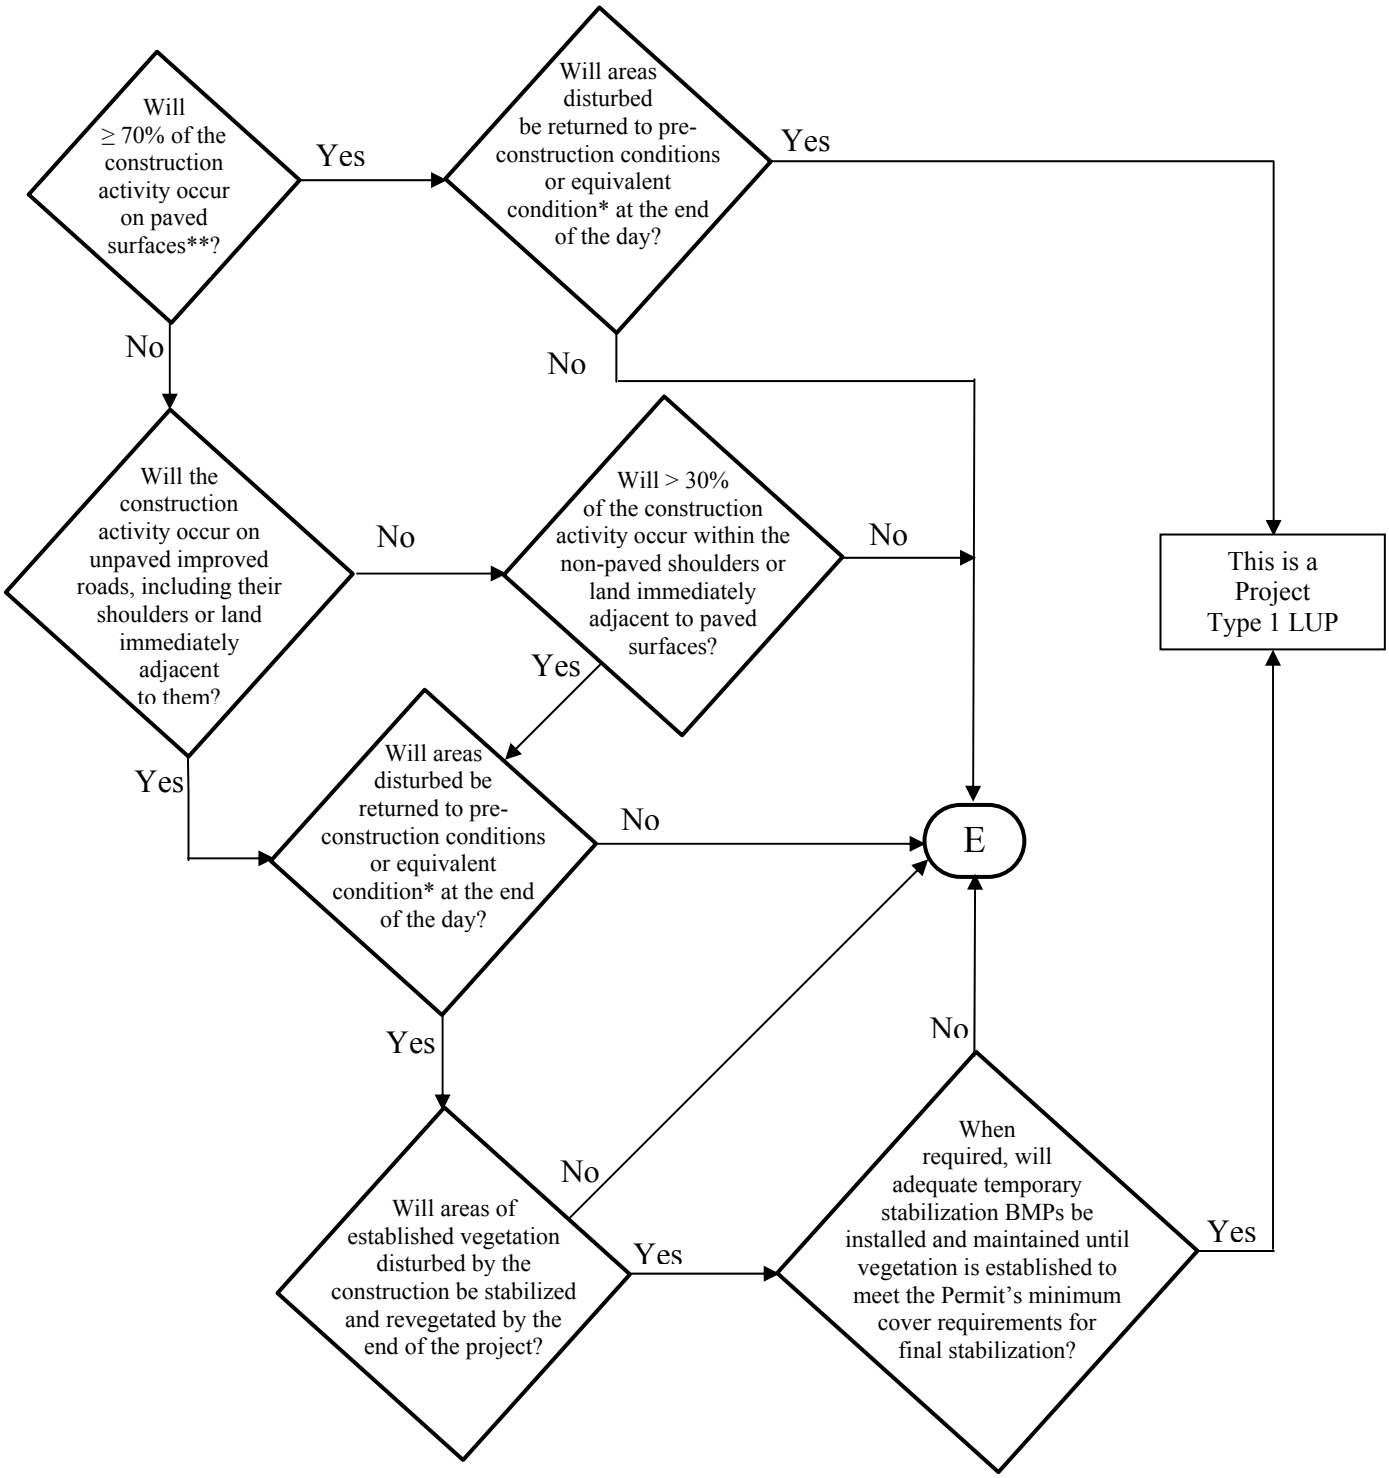
i The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge);

ii The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements;

iii The date and approximate time of analyses;

iv The individual(s) who performed the analyses;

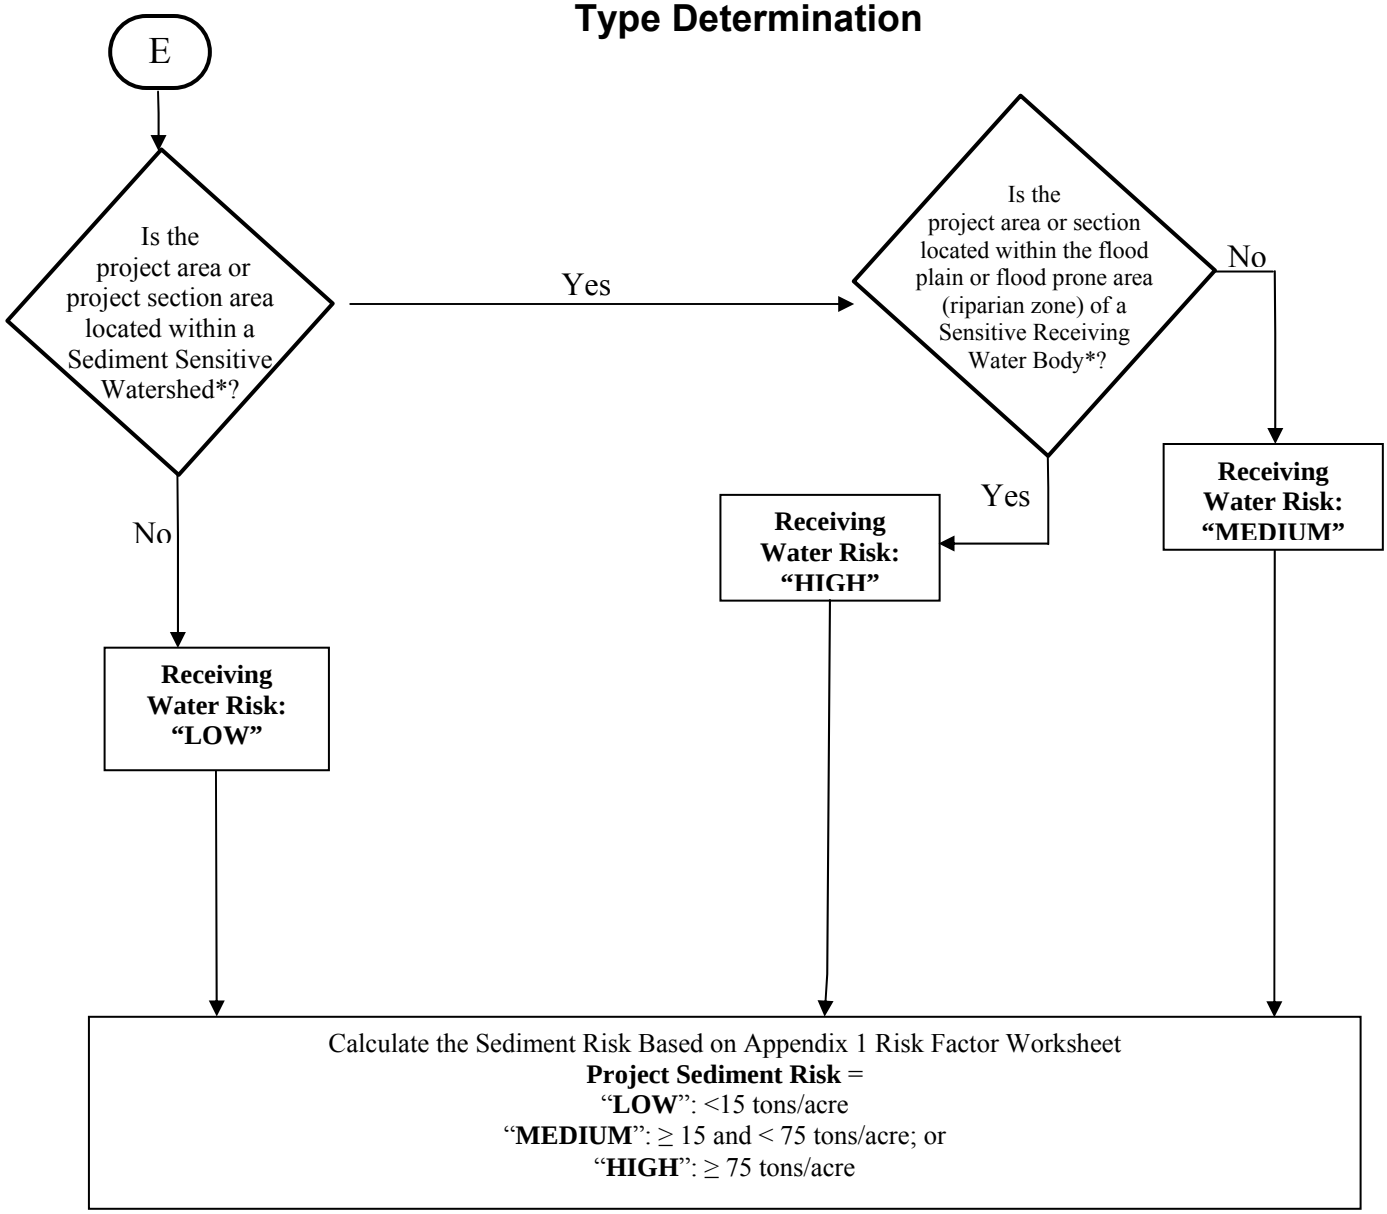
v A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and all chain of custody forms;



vi Quality assurance/quality control records and results;

vii Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Section M.4.a above);

viii Visual observation and sample collection exception records (see Section M.4.g above); and



ix The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

ATTACHMENT A.1

PROJECT SEDIMENT RISK

RECEIVING WATER RISK	**LOW**	**MEDIUM**	**HIGH**
LOW	Type 1	Type 1	Type 2
MEDIUM	Type 1	Type 2	Type 3
HIGH	Type 2	Type 3	Type 3

ATTACHMENT A.1
Definition of Terms

1. **Equivalent Condition** – Means disturbed soils such as those from trench excavation are required to be hauled away, backfilled into the trench, and/or covered (e.g., metal plates, pavement, plastic covers over spoil piles) at the end of the construction day.
2. **Linear Construction Activity** – Linear construction activity consists of underground/ overhead facilities that typically include, but are not limited to, any conveyance, pipe or pipeline for the transportation of any gaseous, liquid (including water, wastewater for domestic municipal services), liquescent, or slurry substance; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications (e.g., telephone, telegraph, radio or television messages); and associated ancillary facilities. Construction activities associated with LUPs include, but are not limited to those activities necessary for the installation of underground and overhead linear facilities (e.g., conduits, substructures, pipelines, towers, poles, cables, wires, connectors, switching, regulating and transforming equipment and associated ancillary facilities) and include, but are not limited to, underground utility mark-out, potholing, concrete and asphalt cutting and removal, trenching, excavation, boring and drilling, access road and pole/ tower pad and cable/ wire pull station, substation construction, substructure installation, construction of tower footings and/or foundations, pole and tower installations, pipeline installations, welding, concrete and/or pavement repair or replacement, and stockpile/ borrow locations.
3. **Sediment Sensitive Receiving Water Body –** Defined as a water body segment that is listed on EPA's approved CWA 303(d) list for sedimentation/siltation, turbidity, or is designated with beneficial uses of SPAWN, MIGRATORY, and COLD.
4. **Sediment Sensitive Watershed –** Defined as a watershed draining into a receiving water body listed on EPA's approved CWA 303(d) list for sedimentation/siltation, turbidity, or a water body designated with beneficial uses of SPAWN, MIGRATORY, and COLD.

ATTACHMENT A.2
PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS FOR LINEAR UNDERGROUND/OVERHEAD PROJECTS TO COMPLY WITH THE CONSTRUCTION GENERAL PERMIT

GENERAL INSTRUCTIONS

Who Must Submit

This permit is effective on July 1, 2010.

The Legally Responsible Person (LRP) for construction activities associated with linear underground/overhead project (LUP) must electronically apply for coverage under this General Permit on or after July 1, 2010. If it is determined that the LUP construction activities require an NPDES permit, the Legally Responsible Person[1] (LRP) shall submit PRDs for this General Permit in accordance with the following:

LUPs associated with Private or Municipal Development Projects

1. For LUPs associated with pre-development and pre-redevelopment construction activities:

   The LRP must obtain coverage[2] under this General Permit for its pre-development and pre-redevelopment construction activities where the total disturbed land area of these construction activities is greater than 1 acre.

2. For LUPs associated with new development and redevelopment construction projects:

   The LRP must obtain coverage under this General Permit for LUP construction activities associated with new development and redevelopment projects where the total disturbed land area of the LUP is greater than 1 acre. Coverage under this permit is not required where the same LUP construction activities are covered by another NPDES permit.

LUPs not associated with private or municipal new development or redevelopment projects:

The LRP must obtain coverage under this General Permit on or after July 1, 2010 for its LUP construction activities where the total disturbed land area is greater than 1 acre.

PRD Submittal Requirements

Prior to the start of construction activities a LRP must submit PRDs and fees to the State Water Board for each LUP.

New and Ongoing LUPs

Dischargers of new LUPs that commence construction activities after the adoption date of this General Permit shall file PRDs prior to the commencement of construction and implement the SWPPP upon the start of construction.

[1] person possessing the title of the land on which the construction activities will occur for the regulated site
[2] obtain coverage means filing PRDs for the project.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

Dischargers of ongoing LUPs that are currently covered under State Water Board Order No. 2003-0007 (Small LUP General Permit) shall electronically file Permit Registration Documents no later than July 1, 2010. After July 1, 2010, all NOIs subject to State Water Board Order No. 2003-0007-DWQ will be terminated. All existing dischargers shall be exempt from the risk determination requirements in Attachment A. All existing dischargers are therefore subject to LUP Type 1 requirements regardless of their project's sediment and receiving water risks. However, a Regional Board retains the authority to require an existing discharger to comply with the risk determination requirements in Attachment A.

Where to Apply

The Permit Registration Documents (PRDs) can be found at www.waterboards.ca.gov/water_issues/programs/stormwater/

Fees

The annual fee for storm water permits are established through the State of California Code of Regulations.

When Permit Coverage Commences

To obtain coverage under the General Permit, the LRP must include the complete PRDs and the annual fee. All PRDs deemed incomplete will be rejected with an explanation as to what is required to complete submittal. Upon receipt of complete PRDs and associated fee, each discharger will be sent a waste discharger's identification (WDID) number.

Projects and Activities Not Defined As Construction Activity

1. LUP construction activity does not include routine maintenance projects to maintain original line and grade, hydraulic capacity, or original purpose of the facility. Routine maintenance projects are projects associated with operations and maintenance activities that are conducted on existing lines and facilities and within existing right-of-way, easements, franchise agreements or other legally binding agreements of the discharger. Routine maintenance projects include, but are not limited to projects that are conducted to:

    - Maintain the original purpose of the facility, or hydraulic capacity.
    - Update existing lines[3] and facilities to comply with applicable codes, standards and regulations regardless if such projects result in increased capacity.
    - Repairing leaks.

    Routine maintenance does not include construction of new[4] lines or facilities resulting from compliance with applicable codes, standards and regulations.

[3] Update existing lines includes replacing existing lines with new materials or pipes.
[4] New lines are those that are not associated with existing facilities and are not part of a project to update or replace existing lines.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

Routine maintenance projects do not include those areas of maintenance projects that are outside of an existing right-of-way, franchise, easements, or agreements. When a project must acquire new areas, those areas may be subject to this General Permit based on the area of disturbed land outside the original right-of-way, easement, or agreement.

2. LUP construction activity does not include field activities associated with the planning and design of a project (e.g., activities associated with route selection).

3. Tie-ins conducted immediately adjacent to "energized" or "pressurized" facilities by the discharger are not considered small construction activities where all other LUP construction activities associated with the tie-in are covered by a NOI and SWPPP of a third party or municipal agency.

Calculating Land Disturbance Areas of LUPs

The total land area disturbed for LUPs is the sum of the:

- Surface areas of trenches, laterals and ancillary facilities, plus
- Area of the base of stockpiles on unpaved surfaces, plus
- Surface area of the borrow area, plus
- Areas of paved surfaces constructed for the project, plus
- Areas of new roads constructed or areas of major reconstruction to existing roads (e.g. improvements to two-track surfaces or road widening) for the sole purpose of accessing construction activities or as part of the final project, plus
- Equipment and material storage, staging, and preparation areas (laydown areas) not on paved surfaces, plus
- Soil areas outside the surface area of trenches, laterals and ancillary facilities that will be graded, and/or disturbed by the use of construction equipment, vehicles and machinery during construction activities.

Stockpiling Areas

Stockpiling areas, borrow areas and the removal of soils from a construction site may or may not be included when calculating the area of disturbed soil for a site depending on the following conditions:

- For stockpiling of soils onsite or immediately adjacent to a LUP site and the stockpile is not on a paved surface, the area of the base of the stockpile is to be included in the disturbed area calculation.

- The surface area of borrow areas that are onsite or immediately adjacent to a project site are to be included in the disturbed area calculation.

- For soil that is hauled offsite to a location owned or operated by the discharger that is not a paved surface, the area of the base of the stockpile is to be included in the disturbed area calculation except when the offsite location is already subject to a separate storm water permit.

PERMIT REGISTRATION DOCUMENTS (PRDs)
GENERAL INSTRUCTIONS (CONTINUED)

- For soil that is brought to the project from an off-site location owned or operated by the discharger the surface area of the borrow pit is to be included in the disturbed area calculation except when the offsite location is already subject to a separate storm water permit.

- Trench spoils on a paved surface that are either returned to the trench or excavation or hauled away from the project daily for disposal or reuse will not be included in the disturbed area calculation.

If you have any questions concerning submittal of PRDs, please call the State Water Board at (866) 563-3107.

ATTACHMENT B
PERMIT REGISTRATION DOCUMENTS (PRDs) TO COMPLY WITH THE TERMS OF THE GENERAL PERMIT TO DISCHARGE STORM WATER ASSOCIATED WITH CONSTRUCTION ACTIVITY

GENERAL INSTRUCTIONS

A. All Linear Construction Projects shall comply with the PRD requirements in Attachment A.2 of this Order.

B. Who Must Submit

Discharges of storm water associated with construction that results in the disturbance of one acre or more of land must apply for coverage under the General Construction Storm Water Permit (General Permit). Any construction activity that is a part of a larger common plan of development or sale must also be permitted, regardless of size. (For example, if 0.5 acre of a 20-acre subdivision is disturbed by the construction activities of discharger A and the remaining 19.5 acres is to be developed by discharger B, discharger A must obtain a General Storm Water Permit for the 0.5 acre project).

Other discharges from construction activities that are covered under this General Permit can be found in the General Permit Section II.B.

It is the LRP's responsibility to obtain coverage under this General Permit by electronically submitting complete PRDs (Permit Registration Documents).

In all cases, the proper procedures for submitting the PRDs must be completed before construction can commence.

C. Construction Activity Not Covered By This General Permit

Discharges from construction that are not covered under this General Permit can be found in the General Permit Sections II.A &B..

D. Annual Fees and Fee Calculation

Annual fees are calculated based upon the total area of land to be disturbed not the total size of the acreage owned. However, the calculation includes all acres to be disturbed during the duration of the project. For example, if 10 acres are scheduled to be disturbed the first year and 10 in each subsequent year for 5 years, the annual fees would be based upon 50 acres of disturbance. The State Water Board will evaluate adding acreage to an existing Permit Waste Discharge Identification (WDID) number on a case-by-case basis. In general, any acreage to be considered must be contiguous to the permitted land area and the existing

SWPPP must be appropriate for the construction activity and topography of the acreage under consideration. As acreage is built out and stabilized or sold, the Change of Information (COI) form enables the applicant to remove those acres from inclusion in the annual fee calculation. Checks should be made payable to: State Water Board.

The Annual fees are established through regulations adopted by the State Water Board. The total annual fee is the current base fee plus applicable surcharges for all construction sites submitting an NOI, based on the total acreage to be disturbed during the life of the project. Annual fees are subject to change by regulation.

Dischargers that apply for and satisfy the Small Construction Erosivity Wavier requirements shall pay a fee of $200.00 plus an applicable surcharge, see the General Permit Section II.B.7.

E. When to Apply

LRP's proposing to conduct construction activities subject to this General Permit must submit their PRDs prior to the commencement of construction activity.

F. Requirements for Completing Permit Registration Documents (PRDs)

All dischargers required to comply with this General Permit shall electronically submit the required PRDs for their type of construction as defined below.

G. Standard PRD Requirements (All Dischargers)

1. Notice of Intent
2. Risk Assessment (Standard or Site-Specific)
3. Site Map
4. SWPPP
5. Annual Fee
6. Certification

H. Additional PRD Requirements Related to Construction Type

1. Discharger in unincorporated areas of the State (not covered under an adopted Phase I or II SUSMP requirements) and that are not a linear project shall also submit a completed:
   a. Post-Construction Water Balance Calculator (Appendix 2).

2. Dischargers who are proposing to implement ATS shall submit:
   a. Complete ATS Plan in accordance with Attachment F at least 14 days prior to the planned operation of the ATS and a paper copy shall be available onsite during ATS operation.

b. Certification proof that design done by a professional in accordance with Attachment F.

3. Dischargers who are proposing an alternate Risk Justification:
   a. Particle Size Analysis.

I. Exceptions to Standard PRD Requirements

Construction sites with an R value less than 5 as determined in the Risk Assessment are not required to submit a SWPPP.

J. Description of PRDs

1. Notice of Intent (NOI)

2. Site Map(s) Includes:
   a. The project's surrounding area (vicinity)
   b. Site layout
   c. Construction site boundaries
   d. Drainage areas
   e. Discharge locations
   f. Sampling locations
   g. Areas of soil disturbance (temporary or permanent)
   h. Active areas of soil disturbance (cut or fill)
   i. Locations of all runoff BMPs
   j. Locations of all erosion control BMPs
   k. Locations of all sediment control BMPs
   l. ATS location (if applicable)
   m. Locations of sensitive habitats, watercourses, or other features which are not to be disturbed
   n. Locations of all post-construction BMPs
   o. Locations of storage areas for waste, vehicles, service, loading/unloading of materials, access (entrance/exits) points to construction site, fueling, and water storage, water transfer for dust control and compaction practices

3. **SWPPPs**
   A site-specific SWPPP shall be developed by each discharger and shall be submitted with the PRDs.

4. **Risk Assessment**
   All dischargers shall use the Risk Assessment procedure as describe in the General Permit Appendix 1.

   a. The Standard Risk Assessment includes utilization of the following:
      i. Receiving water Risk Assessment interactive map

ii. EPA Rainfall Erosivity Factor Calculator Website
iii. Sediment Risk interactive map
iv. Sediment sensitive water bodies list

b. The Site-Specific Risk Assessment includes the completion of the hand calculated R value Risk Calculator

5. **Post-Construction Water Balance Calculator**
All dischargers subject to this requirement shall complete the Water Balance Calculator (in Appendix 2) in accordance with the instructions.

6. **ATS Design Document and Certification**
All dischargers using ATS must submit electronically their system design (as well as any supporting documentation) and proof that the system was designed by a qualified ATS design professional (See Attachment F).

To obtain coverage under the General Permit PRDs must be included and completed. If any of the required items are missing, the PRD submittal is considered incomplete and will be rejected. Upon receipt of a complete PRD submittal, the State Water Board will process the application package in the order received and assign a (WDID) number.

Questions?

If you have any questions on completing the PRDs please email stormwater@waterboards.ca.gov or call (866) 563-3107.

ATTACHMENT C
RISK LEVEL 1 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 1 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric – Risk Level 1 dischargers are not subject to a numeric effluent standard.

B. Good Site Management "Housekeeping"

1. Risk Level 1 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 1 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 1 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 1 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 1 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain fertilizers and other landscape materials when they are not actively being used.

   c. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 1 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 1 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 1 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

C. Non-Storm Water Management

1. Risk Level 1 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 1 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 1 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 1 dischargers shall implement effective wind erosion control.

2. Risk Level 1 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Risk Level 1 dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 1 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 1 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

F. Run-on and Runoff Controls

Risk Level 1 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 1 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee trained to do the task(s) appropriately, but shall ensure adequate deployment.

2. Risk Level 1 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.

storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 1 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 1 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 1 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

    a. Inspection date and date the inspection report was written.

    b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

    c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

    d. A description of any BMPs evaluated and any deficiencies noted.

    e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

    f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

    g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

    h. Photographs taken during the inspection, if any.

    i. Inspector’s name, title, and signature.

H. Rain Event Action Plan

Not required for Risk Level 1 dischargers.

I. Risk Level 1 Monitoring and Reporting Requirements

Table 1- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
1	X	X		X	X		

1. **Construction Site Monitoring Program Requirements**

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Programs to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

   a. To demonstrate that the site is in compliance with the Discharge Prohibitions;

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives;

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges; and

d. To determine whether BMPs included in the SWPPP are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 1 - Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 1 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 1 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 1 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 1 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 1 dischargers shall visually observe (inspect):

i. All storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. All BMPs to identify whether they have been properly implemented in accordance with the SWPPP. If needed, the discharger shall implement appropriate corrective actions.

iii. Any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in e.i and e.iii above, Risk Level 1 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 1 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 1 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 1 – Visual Observation Exemptions**

a. Risk Level 1 dischargers shall be prepared to conduct visual observation (inspections) until the minimum requirements of Section I.3 above are completed. Risk Level 1 dischargers are not required to conduct visual observation (inspections) under the following conditions:

i. During dangerous weather conditions such as flooding and electrical storms.

ii. Outside of scheduled site business hours.

b. If no required visual observations (inspections) are collected due to these exceptions, Risk Level 1 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the visual observations (inspections) were not conducted.

5. **Risk Level 1 – Monitoring Methods**

Risk Level 1 dischargers shall include a description of the visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures in the CSMP.

6. **Risk Level 1 – Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

   i. Risk Level 1 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

   ii. Risk Level 1 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

   iii. Risk Level 1 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 1 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

7. **Risk Level 1 – Non-Visible Pollutant Monitoring Requirements**

   a. Risk Level 1 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

   b. Risk Level 1 dischargers shall ensure that water samples are large enough to characterize the site conditions.

   c. Risk Level 1 dischargers shall collect samples at all discharge locations that can be safely accessed.

   d. Risk Level 1 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

   e. Risk Level 1 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the

presence of pollutants identified in the pollutant source assessment required (Risk Level 1 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 1 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 1 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[2]

h. Risk Level 1 dischargers shall keep all field /or analytical data in the SWPPP document.

8. **Risk Level 1 – Particle Size Analysis for Project Risk Justification**

Risk Level 1 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

9. **Risk Level 1 – Records**

Risk Level 1 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 1 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

d. The individual(s) who performed the analyses.

[2] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, and the analytical techniques or methods used.

f. Rain gauge readings from site inspections.

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.6 above).

i. Visual observation and sample collection exception records (see Section I.4 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

ATTACHMENT D
RISK LEVEL 2 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 2 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric – Risk level 2 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

B. Good Site Management "Housekeeping"

1. Risk Level 2 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 2 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 2 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protect stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly.

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 2 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 2 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain all fertilizers and other landscape materials when they are not actively being used.

   c. Discontinue the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Apply erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stack erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 2 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 2 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 2 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall document all housekeeping BMPs in the SWPPP and REAP(s) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

C. Non-Storm Water Management

1. Risk Level 2 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 2 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 2 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 2 dischargers shall implement effective wind erosion control.

2. Risk Level 2 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Risk Level 2 dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 2 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 2 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

3. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

4. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 1.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.
[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage.
[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 1 - Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

5. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

6. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

7. **Additional Risk Level 2 Requirement:** Risk Level 2 dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

F. Run-on and Run-off Controls

Risk Level 2 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 2 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

2. Risk Level 2 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 2 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 2 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 2 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

   a. Inspection date and date the inspection report was written.

   b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

   c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

   d. A description of any BMPs evaluated and any deficiencies noted.

   e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

   f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

   g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

   h. Photographs taken during the inspection, if any.

   i. Inspector's name, title, and signature.

H. Rain Event Action Plan

1. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop a Rain Event Action Plan (REAP) 48 hours prior to any

likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The discharger shall ensure a QSP obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

2. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

3. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP ensure that the REAP include, at a minimum, the following site information:

   a. Site Address
   b. Calculated Risk Level (2 or 3)
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number
   d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
   e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number

4. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP include in the REAP, at a minimum, the following project phase information:

   a. Activities associated with each construction phase
   b. Trades active on the construction site during each construction phase
   c. Trade contractor information
   d. Suggested actions for each project phase

5. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP develop additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

   a. Site Address
   b. Calculated Risk Level (2 or 3)
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number

d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number
e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number
f. Trades active on site during Inactive Construction
g. Trade contractor information
h. Suggested actions for inactive construction sites

6. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP begin implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

7. **Additional Risk Level 2 Requirement:** The discharger shall ensure a QSP maintain onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

I. Risk Level 2 Monitoring and Reporting Requirements

Table 2- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
2	X	X	X	X	X	X	

1. Construction Site Monitoring Program Requirements

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Programs in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

   a. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs).

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

d. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 2 – Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 2 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 2 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 2 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 2 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 2 dischargers shall visually observe (inspect):

i. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP/REAP. If needed, the discharger shall implement appropriate corrective actions.

iii. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in c.i and c.iii above, Risk Level 2 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 2 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 2 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 2 – Water Quality Sampling and Analysis**

a. Risk Level 2 dischargers shall collect storm water grab samples from sampling locations, as defined in Section I.5. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

b. At minimum, Risk Level 2 dischargers shall collect 3 samples per day of the qualifying event.

c. Risk Level 2 dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

<u>Storm Water Effluent Monitoring Requirements</u>

d. Risk Level 2 dischargers shall analyze their effluent samples for:

i. pH and turbidity.

ii. Any additional parameters for which monitoring is required by the Regional Water Board.

5. **Risk Level 2 – Storm Water Discharge Water Quality Sampling Locations**

Effluent Sampling Locations

a. Risk Level 2 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

b. Risk Level 2 dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

c. Risk Level 2 dischargers shall ensure that storm water discharge collected and observed represent[4] the effluent in each drainage area based on visual observation of the water and upstream conditions.

d. Risk Level 2 dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

e. Risk Level 2 dischargers who deploy an ATS on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

f. Risk Level 2 dischargers shall select analytical test methods from the list provided in Table 3 below.

g. All storm water sample collection preservation and handling shall be conducted in accordance with Section I.7 “Storm Water Sample Collection and Handling Instructions” below.

6. **Risk Level 2 – Visual Observation and Sample Collection Exemptions**

a. Risk Level 2 dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Sections I.3 and I.4 above are completed. Risk Level 2 dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

[4] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment-laden water even if most water flowing through the fence is clear.

i. During dangerous weather conditions such as flooding and electrical storms.

ii. Outside of scheduled site business hours.

b. If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 2 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7. **Risk Level 2 – Storm Water Sample Collection and Handling Instructions**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. Risk Level 2 dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

c. Risk Level 2 dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP).[5]

8. **Risk Level 2 – Monitoring Methods**

a. Risk Level 2 dischargers shall include a description of the following items in the CSMP:

i. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

ii. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program

[5] Additional information regarding SWAMP's QAPrP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/. QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf.

an example Chain of Custody form used when handling and shipping samples.

iii. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section I.4 above.

b. Risk Level 2 dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Risk Level 2 dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services. Risk Level 2 dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

9. **Risk Level 2 – Analytical Methods**

a. Risk Level 2 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. **pH**: Risk Level 2 dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 2 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section I.14, below.

c. **Turbidity**: Risk Level 2 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

10. **Risk Level 2 - Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

   i. Risk Level 2 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

   ii. Risk Level 2 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

   iii. Risk Level 2 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 2 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to reduce or prevent pollutants from contacting non-storm water discharges.

b. Effluent Sampling Locations:

   i. Risk Level 2 dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

   ii. Risk Level 2 dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

   iii. Risk Level 2 dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

11. **Risk Level 2 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 2 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual

inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 2 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 2 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 2 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 2 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 2 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 2 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 2 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[6]

h. Risk Level 2 dischargers shall keep all field /or analytical data in the SWPPP document.

12. **Risk Level 2 – Watershed Monitoring Option**

Risk Level 2 dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in Sections I.5. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

[6] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

13. **Risk Level 2 – Particle Size Analysis for Project Risk Justification**

    Risk Level 2 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

14. **Risk Level 2 – Records**

    Risk Level 2 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 2 dischargers shall retain all records on-site while construction is ongoing. These records include:

    a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

    b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

    c. The date and approximate time of analyses.

    d. The individual(s) who performed the analyses.

    e. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

    f. Rain gauge readings from site inspections;

    g. Quality assurance/quality control records and results.

    h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.10 above).

    i. Visual observation and sample collection exception records (see Section I.6 above).

    j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

15. **Risk Level 2 – NAL Exceedance Report**

a. In the event that any effluent sample exceeds an applicable NAL, Risk Level 2 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

b. Risk Level 2 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity.

c. Risk Level 2 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

d. Risk Level 2 dischargers shall include in the NAL Exceedance Report:

i. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

ii. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

iii. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

Table 3 – Risk Level 2 Test Methods, Detection Limits, Reporting Units and Applicable NALs/NELs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level
pH	Field test with calibrated portable instrument	Risk Level 2 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 2 Discharges other than ATS	1	NTU	250 NTU
		For ATS discharges	1	NTU	N/A

ATTACHMENT E
RISK LEVEL 3 REQUIREMENTS

A. Effluent Standards

[These requirements are the same as those in the General Permit order.]

1. Narrative – Risk Level 3 dischargers shall comply with the narrative effluent standards listed below:

   a. Storm water discharges and authorized non-storm water discharges regulated by this General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.

   b. Dischargers shall minimize or prevent pollutants in storm water discharges and authorized non-storm water discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

2. Numeric –Risk Level 3 dischargers are subject to a pH NAL of 6.5-8.5, and a turbidity NAL of 250 NTU.

B. Good Site Management "Housekeeping"

1. Risk Level 3 dischargers shall implement good site management (i.e., "housekeeping") measures for construction materials that could potentially be a threat to water quality if discharged. At a minimum, Risk Level 3 dischargers shall implement the following good housekeeping measures:

   a. Conduct an inventory of the products used and/or expected to be used and the end products that are produced and/or expected to be produced. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

   b. Cover and berm loose stockpiled construction materials that are not actively being used (i.e. soil, spoils, aggregate, fly-ash, stucco, hydrated lime, etc.).

c. Store chemicals in watertight containers (with appropriate secondary containment to prevent any spillage or leakage) or in a storage shed (completely enclosed).

d. Minimize exposure of construction materials to precipitation. This does not include materials and equipment that are designed to be outdoors and exposed to environmental conditions (i.e. poles, equipment pads, cabinets, conductors, insulators, bricks, etc.).

e. Implement BMPs to prevent the off-site tracking of loose construction and landscape materials.

2. Risk Level 3 dischargers shall implement good housekeeping measures for waste management, which, at a minimum, shall consist of the following:

a. Prevent disposal of any rinse or wash waters or materials on impervious or pervious site surfaces or into the storm drain system.

b. Ensure the containment of sanitation facilities (e.g., portable toilets) to prevent discharges of pollutants to the storm water drainage system or receiving water.

c. Clean or replace sanitation facilities and inspecting them regularly for leaks and spills.

d. Cover waste disposal containers at the end of every business day and during a rain event.

e. Prevent discharges from waste disposal containers to the storm water drainage system or receiving water.

f. Contain and securely protecting stockpiled waste material from wind and rain at all times unless actively being used.

g. Implement procedures that effectively address hazardous and non-hazardous spills.

h. Develop a spill response and implementation element of the SWPPP prior to commencement of construction activities. The SWPPP shall require that:

i. Equipment and materials for cleanup of spills shall be available on site and that spills and leaks shall be cleaned up immediately and disposed of properly; and

ii. Appropriate spill response personnel are assigned and trained.

i. Ensure the containment of concrete washout areas and other washout areas that may contain additional pollutants so there is no discharge into the underlying soil and onto the surrounding areas.

3. Risk Level 3 dischargers shall implement good housekeeping for vehicle storage and maintenance, which, at a minimum, shall consist of the following:

   a. Prevent oil, grease, or fuel to leak in to the ground, storm drains or surface waters.

   b. Place all equipment or vehicles, which are to be fueled, maintained and stored in a designated area fitted with appropriate BMPs.

   c. Clean leaks immediately and disposing of leaked materials properly.

4. Risk Level 3 dischargers shall implement good housekeeping for landscape materials, which, at a minimum, shall consist of the following:

   a. Contain stockpiled materials such as mulches and topsoil when they are not actively being used.

   b. Contain fertilizers and other landscape materials when they are not actively being used.

   c. Discontinuing the application of any erodible landscape material within 2 days before a forecasted rain event or during periods of precipitation.

   d. Applying erodible landscape material at quantities and application rates according to manufacture recommendations or based on written specifications by knowledgeable and experienced field personnel.

   e. Stacking erodible landscape material on pallets and covering or storing such materials when not being used or applied.

5. Risk Level 3 dischargers shall conduct an assessment and create a list of potential pollutant sources and identify any areas of the site where additional BMPs are necessary to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges. This potential pollutant list shall be kept with the SWPPP and shall identify

all non-visible pollutants which are known, or should be known, to occur on the construction site. At a minimum, when developing BMPs, Risk Level 3 dischargers shall do the following:

a. Consider the quantity, physical characteristics (e.g., liquid, powder, solid), and locations of each potential pollutant source handled, produced, stored, recycled, or disposed of at the site.

b. Consider the degree to which pollutants associated with those materials may be exposed to and mobilized by contact with storm water.

c. Consider the direct and indirect pathways that pollutants may be exposed to storm water or authorized non-storm water discharges. This shall include an assessment of past spills or leaks, non-storm water discharges, and discharges from adjoining areas.

d. Ensure retention of sampling, visual observation, and inspection records.

e. Ensure effectiveness of existing BMPs to reduce or prevent pollutants in storm water discharges and authorized non-storm water discharges.

6. Risk Level 3 dischargers shall implement good housekeeping measures on the construction site to control the air deposition of site materials and from site operations. Such particulates can include, but are not limited to, sediment, nutrients, trash, metals, bacteria, oil and grease and organics.

7. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall document all housekeeping BMPs in the SWPPP and REAP(s) in accordance with the nature and phase of the construction project. Construction phases at traditional land development projects include Grading and Land Development Phase, Streets and Utilities, or Vertical Construction for traditional land development projects.

C. Non-Storm Water Management

1. Risk Level 3 dischargers shall implement measures to control all non-storm water discharges during construction.

2. Risk Level 3 dischargers shall wash vehicles in such a manner as to prevent non-storm water discharges to surface waters or MS4 drainage systems.

3. Risk Level 3 dischargers shall clean streets in such a manner as to prevent unauthorized non-storm water discharges from reaching surface water or MS4 drainage systems.

D. Erosion Control

1. Risk Level 3 dischargers shall implement effective wind erosion control.

2. Risk Level 3 dischargers shall provide effective soil cover for inactive[1] areas and all finished slopes, open space, utility backfill, and completed lots.

3. Dischargers shall limit the use of plastic materials when more sustainable, environmentally friendly alternatives exist. Where plastic materials are deemed necessary, the discharger shall consider the use of plastic materials resistant to solar degradation.

E. Sediment Controls

1. Risk Level 3 dischargers shall establish and maintain effective perimeter controls and stabilize all construction entrances and exits to sufficiently control erosion and sediment discharges from the site.

2. On sites where sediment basins are to be used, Risk Level 3 dischargers shall, at minimum, design sediment basins according to the method provided in CASQA's Construction BMP Guidance Handbook.

3. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall implement appropriate erosion control BMPs (runoff control and soil stabilization) in conjunction with sediment control BMPs for areas under active[2] construction.

4. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall apply linear sediment controls along the toe of the slope, face of the slope, and at the grade breaks of exposed slopes to comply with sheet flow lengths[3] in accordance with Table 1.

[1] Inactive areas of construction are areas of construction activity that have been disturbed and are not scheduled to be re-disturbed for at least 14 days.
[2] Active areas of construction are areas undergoing land surface disturbance. This includes construction activity during the preliminary stage, mass grading stage, streets and utilities stage and the vertical construction stage
[3] Sheet flow length is the length that shallow, low velocity flow travels across a site.

Table 1 - Critical Slope/Sheet Flow Length Combinations

Slope Percentage	Sheet flow length not to exceed
0-25%	20 feet
25-50%	15 feet
Over 50%	10 feet

5. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall ensure that construction activity traffic to and from the project is limited to entrances and exits that employ effective controls to prevent offsite tracking of sediment.

6. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall ensure that all storm drain inlets and perimeter controls, runoff control BMPs, and pollutant controls at entrances and exits (e.g. tire washoff locations) are maintained and protected from activities that reduce their effectiveness.

7. **Additional Risk Level 3 Requirement:** Risk Level 3 dischargers shall inspect on a daily basis all immediate access roads daily. At a minimum daily (when necessary) and prior to any rain event, the discharger shall remove any sediment or other construction activity-related materials that are deposited on the roads (by vacuuming or sweeping).

8. **Additional Risk Level 3 Requirement:** The Regional Water Board may require Risk Level 3 dischargers to implement additional site-specific sediment control requirements if the implementation of the other requirements in this section are not adequately protecting the receiving waters.

F. Run-on and Run-off Controls

Risk Level 3 dischargers shall effectively manage all run-on, all runoff within the site and all runoff that discharges off the site. Run-on from off site shall be directed away from all disturbed areas or shall collectively be in compliance with the effluent limitations in this General Permit.

G. Inspection, Maintenance and Repair

1. Risk Level 3 dischargers shall ensure that all inspection, maintenance repair and sampling activities at the project location shall be performed or supervised by a Qualified SWPPP Practitioner (QSP) representing the discharger. The QSP may delegate any or all of these activities to an employee appropriately trained to do the task(s).

2. Risk Level 3 dischargers shall perform weekly inspections and observations, and at least once each 24-hour period during extended storm events, to identify and record BMPs that need maintenance to operate effectively, that have failed, or that could fail to operate as intended. Inspectors shall be the QSP or be trained by the QSP.

3. Upon identifying failures or other shortcomings, as directed by the QSP, Risk Level 3 dischargers shall begin implementing repairs or design changes to BMPs within 72 hours of identification and complete the changes as soon as possible.

4. For each inspection required, Risk Level 3 dischargers shall complete an inspection checklist, using a form provided by the State Water Board or Regional Water Board or in an alternative format.

5. Risk Level 3 dischargers shall ensure that checklists shall remain onsite with the SWPPP and at a minimum, shall include:

    a. Inspection date and date the inspection report was written.

    b. Weather information, including presence or absence of precipitation, estimate of beginning of qualifying storm event, duration of event, time elapsed since last storm, and approximate amount of rainfall in inches.

    c. Site information, including stage of construction, activities completed, and approximate area of the site exposed.

    d. A description of any BMPs evaluated and any deficiencies noted.

    e. If the construction site is safely accessible during inclement weather, list the observations of all BMPs: erosion controls, sediment controls, chemical and waste controls, and non-storm water controls. Otherwise, list the results of visual inspections at all relevant outfalls, discharge points, downstream locations and any projected maintenance activities.

    f. Report the presence of noticeable odors or of any visible sheen on the surface of any discharges.

    g. Any corrective actions required, including any necessary changes to the SWPPP and the associated implementation dates.

    h. Photographs taken during the inspection, if any.

i. Inspector's name, title, and signature.

H. Rain Event Action Plan

1. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP develop a Rain Event Action Plan (REAP) 48 hours prior to any likely precipitation event. A likely precipitation event is any weather pattern that is forecast to have a 50% or greater probability of producing precipitation in the project area. The QSP shall obtain a printed copy of precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

2. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP develop the REAPs for all phases of construction (i.e., Grading and Land Development, Streets and Utilities, Vertical Construction, Final Landscaping and Site Stabilization).

3. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP ensure that the REAP include, at a minimum, the following site information:

   a. Site Address.
   b. Calculated Risk Level (2 or 3).
   c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number.
   d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number.
   e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number.

4. **Additional Risk Level 3 Requirement:** The QSP shall include in the REAP, at a minimum, the following project phase information:

   a. Activities associated with each construction phase.
   b. Trades active on the construction site during each construction phase.
   c. Trade contractor information.
   d. Suggested actions for each project phase.

5. **Additional Risk Level 3 Requirement:** The QSP shall develop additional REAPs for project sites where construction activities are indefinitely halted or postponed (Inactive Construction). At a minimum, Inactive Construction REAPs must include:

a. Site Address.
b. Calculated Risk Level (2 or 3).
c. Site Storm Water Manager Information including the name, company, and 24-hour emergency telephone number.
d. Erosion and Sediment Control Provider information including the name, company, and 24-hour emergency telephone number.
e. Storm Water Sampling Agent information including the name, company, and 24-hour emergency telephone number.
f. Trades active on site during Inactive Construction.
g. Trade contractor information.
h. Suggested actions for inactive construction sites.

6. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP begin implementation and make the REAP available onsite no later than 24 hours prior to the likely precipitation event.

7. **Additional Risk Level 3 Requirement:** The discharger shall ensure a QSP maintain onsite a paper copy of each REAP onsite in compliance with the record retention requirements of the Special Provisions in this General Permit.

I. Risk Level 3 Monitoring and Reporting Requirements

Table 2- Summary of Monitoring Requirements

Risk Level	Visual Inspections					Sample Collection	
	Quarterly Non-storm Water Discharge	Pre-storm Event		Daily Storm BMP	Post Storm	Storm Water Discharge	Receiving Water
		Baseline	REAP				
3	X	X	X	X	X	X	X[4]

1. Construction Site Monitoring Program Requirements

   a. Pursuant to Water Code Sections 13383 and 13267, all dischargers subject to this General Permit shall develop and implement a written site-specific Construction Site Monitoring Program (CSMP) in accordance with the requirements of this Section. The CSMP shall include all monitoring procedures and instructions, location maps, forms, and checklists as required in this section. The CSMP shall be developed prior to the commencement of construction activities, and revised as necessary to reflect project revisions. The CSMP shall be a part of the Storm Water Pollution Prevention Plan (SWPPP), included as an appendix or separate SWPPP chapter.

   b. Existing dischargers registered under the State Water Board Order No. 99-08-DWQ shall make and implement necessary revisions to their Monitoring Program to reflect the changes in this General Permit in a timely manner, but no later than July 1, 2010. Existing dischargers shall continue to implement their existing Monitoring Program in compliance with State Water Board Order No. 99-08-DWQ until the necessary revisions are completed according to the schedule above.

   c. When a change of ownership occurs for all or any portion of the construction site prior to completion or final stabilization, the new discharger shall comply with these requirements as of the date the ownership change occurs.

2. **Objectives**

   The CSMP shall be developed and implemented to address the following objectives:

[4] When receiving water monitoring trigger is exceeded

a. To demonstrate that the site is in compliance with the Discharge Prohibitions and applicable Numeric Action Levels (NALs) of this General Permit.

b. To determine whether non-visible pollutants are present at the construction site and are causing or contributing to exceedances of water quality objectives.

c. To determine whether immediate corrective actions, additional Best Management Practice (BMP) implementation, or SWPPP revisions are necessary to reduce pollutants in storm water discharges and authorized non-storm water discharges.

d. To determine whether BMPs included in the SWPPP/Rain Event Action Plan (REAP) are effective in preventing or reducing pollutants in storm water discharges and authorized non-storm water discharges.

3. **Risk Level 3 – Visual Monitoring (Inspection) Requirements for Qualifying Rain Events**

a. Risk Level 3 dischargers shall visually observe (inspect) storm water discharges at all discharge locations within two business days (48 hours) after each qualifying rain event.

b. Risk Level 3 dischargers shall visually observe (inspect) the discharge of stored or contained storm water that is derived from and discharged subsequent to a qualifying rain event producing precipitation of ½ inch or more at the time of discharge. Stored or contained storm water that will likely discharge after operating hours due to anticipated precipitation shall be observed prior to the discharge during operating hours.

c. Risk Level 3 dischargers shall conduct visual observations (inspections) during business hours only.

d. Risk Level 3 dischargers shall record the time, date and rain gauge reading of all qualifying rain events.

e. Within 2 business days (48 hours) prior to each qualifying rain event, Risk Level 3 dischargers shall visually observe (inspect):

i. all storm water drainage areas to identify any spills, leaks, or uncontrolled pollutant sources. If needed, the discharger shall implement appropriate corrective actions.

ii. all BMPs to identify whether they have been properly implemented in accordance with the SWPPP/REAP. If needed, the discharger shall implement appropriate corrective actions.

iii. any storm water storage and containment areas to detect leaks and ensure maintenance of adequate freeboard.

f. For the visual observations (inspections) described in c.i. and c.iii above, Risk Level 3 dischargers shall observe the presence or absence of floating and suspended materials, a sheen on the surface, discolorations, turbidity, odors, and source(s) of any observed pollutants.

g. Within two business days (48 hours) after each qualifying rain event, Risk Level 3 dischargers shall conduct post rain event visual observations (inspections) to (1) identify whether BMPs were adequately designed, implemented, and effective, and (2) identify additional BMPs and revise the SWPPP accordingly.

h. Risk Level 3 dischargers shall maintain on-site records of all visual observations (inspections), personnel performing the observations, observation dates, weather conditions, locations observed, and corrective actions taken in response to the observations.

4. **Risk Level 3 – Water Quality Sampling and Analysis**

a. Risk Level 3 dischargers shall collect storm water grab samples from sampling locations, as defined in Section I.5. The storm water grab sample(s) obtained shall be representative of the flow and characteristics of the discharge.

b. At minimum, Risk Level 3 dischargers shall collect 3 samples per day of the qualifying event.

c. Risk Level 3 dischargers shall ensure that the grab samples collected of stored or contained storm water are from discharges subsequent to a qualifying rain event (producing precipitation of ½ inch or more at the time of discharge).

<u>Storm Water Effluent Monitoring Requirements</u>

d. Risk Level 3 dischargers shall analyze their effluent samples for:

i. pH and turbidity.

ii. Any additional parameters for which monitoring is required by the Regional Water Board.

e. Risk 3 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event.

Receiving Water Monitoring Requirements

f. In the event that a Risk Level 3 discharger's effluent exceeds the daily average receiving water monitoring trigger of 500 NTU turbidity or the daily average pH range 6.0-9.0 contained in this General Permit and has a direct discharge into receiving waters, the Risk Level 3 discharger shall subsequently sample receiving waters (RWs) for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit. If a Risk Level 3 discharger utilizing ATS with direct discharges into receiving waters discharges effluent that exceeds the NELs in this permit, the discharger shall subsequently sample RWs for turbidity, pH (if applicable), and SSC for the duration of coverage under this General Permit.

g. Risk Level 3 dischargers disturbing 30 acres or more of the landscape and with direct discharges into receiving waters shall conduct or participate in benthic macroinvertebrate bioassessment of RWs prior to commencement of construction activity (See Appendix 3).

h. Risk Level 3 dischargers shall obtain RW samples in accordance with the Receiving Water sampling location section (Section I.5), below.

5. **Risk Level 3 – Storm Water Discharge Water Quality Sampling Locations**

Effluent Sampling Locations

a. Risk Level 3 dischargers shall perform sampling and analysis of storm water discharges to characterize discharges associated with construction activity from the entire project disturbed area.

b. Risk Level 3 dischargers shall collect effluent samples at all discharge points where storm water is discharged off-site.

c. Risk Level 3 dischargers shall ensure that storm water discharge collected and observed represent[5] the effluent in each drainage area based on visual observation of the water and upstream conditions.

d. Risk Level 3 dischargers shall monitor and report site run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

e. Risk Level 3 dischargers who deploy an ATS on their site, or a portion on their site, shall collect ATS effluent samples and measurements from the discharge pipe or another location representative of the nature of the discharge.

f. Risk Level 3 dischargers shall select analytical test methods from the list provided in Table 3 below.

g. All storm water sample collection preservation and handling shall be conducted in accordance with Section I.7 “Storm Water Sample Collection and Handling Instructions” below.

Receiving Water Sampling Locations

h. **Upstream/up-gradient RW samples**: Risk Level 3 dischargers shall obtain any required upstream/up-gradient receiving water samples from a representative and accessible location as close as possible and upstream from the effluent discharge point.

i. **Downstream/down-gradient RW samples**: Risk Level 3 dischargers shall obtain any required downstream/down-gradient receiving water samples from a representative and accessible location as close as possible and downstream from the effluent discharge point.

j. If two or more discharge locations discharge to the same receiving water, Risk Level 3 dischargers may sample the receiving water at a single upstream and downstream location.

[5] For example, if there has been concrete work recently in an area, or drywall scrap is exposed to the rain, a pH sample shall be taken of drainage from the relevant work area. Similarly, if sediment-laden water is flowing through some parts of a silt fence, samples shall be taken of the sediment laden water even if most water flowing through the fence is clear.

6. **Risk Level 3 – Visual Observation and Sample Collection Exemptions**

   a. Risk Level 3 dischargers shall be prepared to collect samples and conduct visual observation (inspections) until the minimum requirements of Sections I.3 and I.4 above are completed. Risk Level 3 dischargers are not required to physically collect samples or conduct visual observation (inspections) under the following conditions:

      i. During dangerous weather conditions such as flooding and electrical storms.

      ii. Outside of scheduled site business hours.

   b. If no required samples or visual observation (inspections) are collected due to these exceptions, Risk Level 3 dischargers shall include an explanation in their SWPPP and in the Annual Report documenting why the sampling or visual observation (inspections) were not conducted.

7. **Risk Level 3 – Storm Water Sample Collection and Handling Instructions**

   a. Risk Level 3 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

   b. Risk Level 3 dischargers shall ensure that testing laboratories will receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory), and shall use only the sample containers provided by the laboratory to collect and store samples.

   c. Risk Level 3 dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the Surface Water Ambient Monitoring Program's (SWAMP) 2008 Quality Assurance Program Plan (QAPrP).[6]

[6] Additional information regarding SWAMP's QAPrP can be found at http://www.waterboards.ca.gov/water_issues/programs/swamp/.
QAPrP:http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/qapp/swamp_qapp_master090108a.pdf

8. **Risk Level 3 – Monitoring Methods**

   a. Risk Level 3 dischargers shall include a description of the following items in the CSMP:

      i. Visual observation locations, visual observation procedures, and visual observation follow-up and tracking procedures.

      ii. Sampling locations, and sample collection and handling procedures. This shall include detailed procedures for sample collection, storage, preservation, and shipping to the testing lab to assure that consistent quality control and quality assurance is maintained. Dischargers shall attach to the monitoring program an example Chain of Custody form used when handling and shipping samples.

      iii. Identification of the analytical methods and related method detection limits (if applicable) for each parameter required in Section I.4 above.

   b. Risk Level 3 dischargers shall ensure that all sampling and sample preservation are in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association). All monitoring instruments and equipment (including a discharger's own field instruments for measuring pH and turbidity) should be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. Risk Level 3 dischargers shall ensure that all laboratory analyses are conducted according to test procedures under 40 CFR Part 136, unless other test procedures have been specified in this General Permit or by the Regional Water Board. With the exception of field analysis conducted by the discharger for turbidity and pH, all analyses should be sent to and conducted at a laboratory certified for such analyses by the State Department of Health Services (SSC exception). Risk Level 3 dischargers shall conduct their own field analysis of pH and may conduct their own field analysis of turbidity if the discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis.

9. **Risk Level 3 – Analytical Methods**

   a. Risk Level 3 dischargers shall refer to Table 3 below for test methods, detection limits, and reporting units.

b. **pH**: Risk Level 3 dischargers shall perform pH analysis on-site with a calibrated pH meter or a pH test kit. Risk Level 3 dischargers shall record pH monitoring results on paper and retain these records in accordance with Section I.14, below.

c. **Turbidity**: Risk Level 3 dischargers shall perform turbidity analysis using a calibrated turbidity meter (turbidimeter), either on-site or at an accredited lab. Acceptable test methods include Standard Method 2130 or USEPA Method 180.1. The results will be recorded in the site log book in Nephelometric Turbidity Units (NTU).

d. **Suspended sediment concentration (SSC)**: Risk Level 3 dischargers that exceed the turbidity Receiving Water Monitoring Trigger shall perform SSC analysis using ASTM Method D3977-97.

e. **Bioassessment**: Risk Level 3 dischargers shall perform bioassessment sampling and analysis according to Appendix 3 of this General Permit.

10. **Risk Level 3 - Non-Storm Water Discharge Monitoring Requirements**

a. Visual Monitoring Requirements:

i. Risk Level 3 dischargers shall visually observe (inspect) each drainage area for the presence of (or indications of prior) unauthorized and authorized non-storm water discharges and their sources.

ii. Risk Level 3 dischargers shall conduct one visual observation (inspection) quarterly in each of the following periods: January-March, April-June, July-September, and October-December. Visual observation (inspections) are only required during daylight hours (sunrise to sunset).

iii. Risk Level 3 dischargers shall ensure that visual observations (inspections) document the presence or evidence of any non-storm water discharge (authorized or unauthorized), pollutant characteristics (floating and suspended material, sheen, discoloration, turbidity, odor, etc.), and source. Risk Level 3 dischargers shall maintain on-site records indicating the personnel performing the visual observation (inspections), the dates and approximate time each drainage area and non-storm water discharge was observed, and the response taken to eliminate unauthorized non-storm water discharges and to

reduce or prevent pollutants from contacting non-storm water discharges.

b. Effluent Sampling Locations:

i. Risk Level 3 dischargers shall sample effluent at all discharge points where non-storm water and/or authorized non-storm water is discharged off-site.

ii. Risk Level 3 dischargers shall send all non-storm water sample analyses to a laboratory certified for such analyses by the State Department of Health Services.

iii. Risk Level 3 dischargers shall monitor and report run-on from surrounding areas if there is reason to believe run-on may contribute to an exceedance of NALs.

11. **Risk Level 3 – Non-Visible Pollutant Monitoring Requirements**

a. Risk Level 3 dischargers shall collect one or more samples during any breach, malfunction, leakage, or spill observed during a visual inspection which could result in the discharge of pollutants to surface waters that would not be visually detectable in storm water.

b. Risk Level 3 dischargers shall ensure that water samples are large enough to characterize the site conditions.

c. Risk Level 3 dischargers shall collect samples at all discharge locations that can be safely accessed.

d. Risk Level 3 dischargers shall collect samples during the first two hours of discharge from rain events that occur during business hours and which generate runoff.

e. Risk Level 3 dischargers shall analyze samples for all non-visible pollutant parameters (if applicable) - parameters indicating the presence of pollutants identified in the pollutant source assessment required (Risk Level 3 dischargers shall modify their CSMPs to address these additional parameters in accordance with any updated SWPPP pollutant source assessment).

f. Risk Level 3 dischargers shall collect a sample of storm water that has not come in contact with the disturbed soil or the materials stored or used on-site (uncontaminated sample) for comparison with the discharge sample.

g. Risk Level 3 dischargers shall compare the uncontaminated sample to the samples of discharge using field analysis or through laboratory analysis.[7]

h. Risk Level 3 dischargers shall keep all field /or analytical data in the SWPPP document.

12. **Risk Level 3 – Watershed Monitoring Option**

Risk Level 3 dischargers who are part of a qualified regional watershed-based monitoring program may be eligible for relief from the requirements in Sections I.5. The Regional Water Board may approve proposals to substitute an acceptable watershed-based monitoring program by determining if the watershed-based monitoring program will provide substantially similar monitoring information in evaluating discharger compliance with the requirements of this General Permit.

13. **Risk Level 3 – Particle Size Analysis for Project Risk Justification**

Risk Level 3 dischargers justifying an alternative project risk shall report a soil particle size analysis used to determine the RUSLE K-Factor. ASTM D-422 (Standard Test Method for Particle-Size Analysis of Soils), as revised, shall be used to determine the percentages of sand, very fine sand, silt, and clay on the site.

14. **Risk Level 3 – Records**

Risk Level 3 dischargers shall retain records of all storm water monitoring information and copies of all reports (including Annual Reports) for a period of at least three years. Risk Level 3 dischargers shall retain all records on-site while construction is ongoing. These records include:

a. The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation.

b. The individual(s) who performed the facility inspections, sampling, visual observation (inspections), and or measurements.

c. The date and approximate time of analyses.

[7] For laboratory analysis, all sampling, sample preservation, and analyses must be conducted according to test procedures under 40 CFR Part 136. Field discharge samples shall be collected and analyzed according to the specifications of the manufacturer of the sampling devices employed.

d. The individual(s) who performed the analyses.

e. A summary of all analytical results from the last three years, the method detection limits and reporting units, the analytical techniques or methods used, and the chain of custody forms.

f. Rain gauge readings from site inspections.

g. Quality assurance/quality control records and results.

h. Non-storm water discharge inspections and visual observation (inspections) and storm water discharge visual observation records (see Sections I.3 and I.10 above).

i. Visual observation and sample collection exception records (see Section I.6 above).

j. The records of any corrective actions and follow-up activities that resulted from analytical results, visual observation (inspections), or inspections.

15. **Risk Level 3 – NAL Exceedance Report**

a. Risk Level 3 dischargers shall electronically submit all storm event sampling results to the State Water Board no later than 10 days after the conclusion of the storm event. The Regional Boards have the authority to require the submittal of an NAL Exceedance Report.

b. Risk Level 3 dischargers shall certify each NAL Exceedance Report in accordance with the Special Provisions for Construction Activity In this General Permit.

c. Risk Level 3 dischargers shall retain an electronic or paper copy of each NAL Exceedance Report for a minimum of three years after the date the annual report is filed.

d. Risk Level 3 dischargers shall include in the NAL Exceedance Report:

i. The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”).

ii. The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation.

iii. A description of the current BMPs associated with the effluent sample that exceeded the NAL and the proposed corrective actions taken.

16. **Risk Level 3 – Bioassessment**

a. Risk Level 3 dischargers with a total project-related ground disturbance exceeding 30 acres shall:

i. Conduct bioassessment monitoring, as described in Appendix 3.

ii. Include the collection and reporting of specified in stream biological data and physical habitat.

iii. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP).[8]

b. Risk Level 3 dischargers qualifying for bioassessment, where construction commences out of an index period for the site location shall:

i. Receive Regional Board approval for the sampling exception.

ii. Conduct bioassessment monitoring, as described in Appendix 3.

iii. Include the collection and reporting of specified instream biological data and physical habitat.

iv. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP).

OR

v. Make a check payable to: Cal State Chico Foundation (SWAMP Bank Account) or San Jose State Foundation (SWAMP Bank Account) and include the WDID# on the check for the amount calculated for the exempted project.

[8] http://www.waterboards.ca.gov/water_issues/programs/swamp/.

vi. Send a copy of the check to the Regional Water Board office for the site's region.

vii. Invest $**7,500.00 X The number of samples required** into the SWAMP program as compensation (upon regional board approval).

Table 3 – Risk Level 3 Test Methods, Detection Limits, Reporting Units and Applicable NALs

Parameter	Test Method / Protocol	Discharge Type	Min. Detection Limit	Reporting Units	Numeric Action Level	Numeric Effluent Limitation	Receiving Water Monitoring Trigger
pH	Field test with calibrated portable instrument	Risk Level 3 Discharges	0.2	pH units	lower NAL = 6.5 upper NAL = 8.5	N/A	lower limit = 6.0 upper limit = 9.0
Turbidity	EPA 0180.1 and/or field test with calibrated portable instrument	Risk Level 3 Discharges other than ATS	1	NTU	250 NTU	N/A	500 NTU
		For ATS discharges	1	NTU	N/A	10 NTU for Daily Weighted Average & 20 NTU for Any Single Sample	10 NTU for Daily Weighted Average & 20 NTU for Any Single Sample
SSC	ASTM Method D 3977-97[9]	Risk Level 3 (if Receiving Water Monitoring Trigger exceeded)	5	mg/L	N/A	N/A	N/A
Bioassessment	(STE) Level I of (SAFIT),[10] fixed-count of 600 org/sample	Risk Level 3 projects> 30 acres	N/A	N/A	N/A	N/A	N/A

[10] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

ATTACHMENT F:
Active Treatment System (ATS) Requirements

Table 1 – Numeric Effluent Limitations, Numeric Action Levels, Test Methods, Detection Limits, and Reporting Units

Parameter	Test Method	Discharge Type	Min. Detection Limit	Units	Numeric Action Level	Numeric Effluent Limitation
Turbidity	EPA 0180.1 and/or field test with a calibrated portable instrument	For ATS discharges	1	NTU	N/A	10 NTU for Daily Flow-Weighted Average & 20 NTU for Any Single Sample

A. Dischargers choosing to implement an Active Treatment System (ATS) on their site shall comply with all of the requirements in this Attachment.

B. The discharger shall maintain a paper copy of each ATS specification onsite in compliance with the record retention requirements in the Special Provisions of this General Permit.

C. ATS Design, Operation and Submittals

1. The ATS shall be designed and approved by a Certified Professional in Erosion and Sediment Control (CPESC), a Certified Professional in Storm Water Quality (CPSWQ); a California registered civil engineer; or any other California registered engineer.

2. The discharger shall ensure that the ATS is designed in a manner to preclude the accidental discharge of settled floc[1] during floc pumping or related operations.

3. The discharger shall design outlets to dissipate energy from concentrated flows.

4. The discharger shall install and operate an ATS by assigning a lead person (or project manager) who has either a minimum of five years construction storm

[1] Floc is defined as a clump of solids formed by the chemical action in ATS systems.

water experience or who is a licensed contractors specifically holding a California Class A Contractors license.[2]

5. The discharger shall prepare an ATS Plan that combines the site-specific data and treatment system information required to safely and efficiently operate an ATS. The ATS Plan shall be electronically submitted to the State Water Board at least 14 days prior to the planned operation of the ATS and a paper copy shall be available onsite during ATS operation. At a minimum, the ATS Plan shall include:

   a. ATS Operation and Maintenance Manual for All Equipment.

   b. ATS Monitoring, Sampling & Reporting Plan, including Quality Assurance/Quality Control (QA/QC).

   c. ATS Health and Safety Plan.

   d. ATS Spill Prevention Plan.

6. The ATS shall be designed to capture and treat (within a 72-hour period) a volume equivalent to the runoff from a 10-year, 24-hour storm event using a watershed runoff coefficient of 1.0.

D. Treatment – Chemical Coagulation/Flocculation

1. Jar tests shall be conducted using water samples selected to represent typical site conditions and in accordance with ASTM D2035-08 (2003).

2. The discharger shall conduct, at minimum, six site-specific jar tests (per polymer with one test serving as a control) for each project to determine the proper polymer and dosage levels for their ATS.

3. Single field jar tests may also be conducted during a project if conditions warrant, for example if construction activities disturb changing types of soils, which consequently cause change in storm water and runoff characteristics.

E. Residual Chemical and Toxicity Requirements

1. The discharger shall utilize a residual chemical test method that has a method detection limit (MDL) of 10% or less than the maximum allowable threshold

[2] Business and Professions Code Division 3, Chapter 9, Article 4, Class A Contractor: A general engineering contractor is a contractor whose principal contracting business is in connection with fixed works requiring specialized engineering knowledge and skill. [http://www.cslb.ca.gov/General-Information/library/licensing-classifications.asp].

concentration[3] (MATC) for the specific coagulant in use and for the most sensitive species of the chemical used.

2. The discharger shall utilize a residual chemical test method that produces a result within one hour of sampling.

3. The discharger shall have a California State certified laboratory validate the selected residual chemical test. Specifically the lab will review the test protocol, test parameters, and the detection limit of the coagulant. The discharger shall electronically submit this documentation as part of the ATS Plan.

4. If the discharger cannot utilize a residual chemical test method that meets the requirements above, the discharger shall operate the ATS in Batch Treatment[4] mode.

5. A discharger planning to operate in Batch Treatment mode shall perform toxicity testing in accordance with the following:

   a. The discharger shall initiate acute toxicity testing on effluent samples representing effluent from each batch prior to discharge[5]. All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHS) Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.[6]

   b. Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012" for Fathead minnow, *Pimephales promelas* (fathead minnow). Acute toxicity for *Oncorhynchus mykiss* (Rainbow Trout) may be used as a substitute for testing fathead minnows.

   c. All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.

   d. The discharger shall electronically report all acute toxicity testing.

[3] The Maximum Allowable Threshold Concentration (MATC) is the allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity testing conducted by an independent, third-party laboratory. A typical MATC would be:
The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.
[4] Batch Treatment mode is defined as holding or recirculating the treated water in a holding basin or tank(s) until treatment is complete or the basin or storage tank(s) is full.
[5] This requirement only requires that the test be initiated prior to discharge.
[6] http://www.dhs.ca.gov/ps/ls/elap/pdf/FOT_Desc.pdf.

F. Filtration

1. The ATS shall include a filtration step between the coagulant treatment train and the effluent discharge. This is commonly provided by sand, bag, or cartridge filters, which are sized to capture suspended material that might pass through the clarifier tanks.

2. Differential pressure measurements shall be taken to monitor filter loading and confirm that the final filter stage is functioning properly.

G. Residuals Management

1. Sediment shall be removed from the storage or treatment cells as necessary to ensure that the cells maintain their required water storage (i.e., volume) capability.

2. Handling and disposal of all solids generated during ATS operations shall be done in accordance with all local, state, and federal laws and regulations.

H. ATS Instrumentation

1. The ATS shall be equipped with instrumentation that automatically measures and records effluent water quality data and flow rate.

2. The minimum data recorded shall be consistent with the Monitoring and Reporting requirements below, and shall include:

    a. Influent Turbidity

    b. Effluent Turbidity

    c. Influent pH

    d. Effluent pH

    e. Residual Chemical

    f. Effluent Flow rate

    g. Effluent Flow volume

3. Systems shall be equipped with a data recording system, such as data loggers or webserver-based systems, which records each measurement on a frequency no longer than once every 15 minutes.

4. Cumulative flow volume shall be recorded daily. The data recording system shall have the capacity to record a minimum of seven days continuous data.

5. Instrumentation systems shall be interfaced with system control to provide auto shutoff or recirculation in the event that effluent measurements exceed turbidity or pH.

6. The system shall also assure that upon system upset, power failure, or other catastrophic event, the ATS will default to a recirculation mode or safe shut down.

7. Instrumentation (flow meters, probes, valves, streaming current detectors, controlling computers, etc.) shall be installed and maintained per manufacturer's recommendations, which shall be included in the QA/QC plan.

8. The QA/QC plan shall also specify calibration procedures and frequencies, instrument method detection limit or sensitivity verification, laboratory duplicate procedures, and other pertinent procedures.

9. The instrumentation system shall include a method for controlling coagulant dose, to prevent potential overdosing. Available technologies include flow/turbidity proportional metering, periodic jar testing and metering pump adjustment, and ionic charge measurement controlling the metering pump.

I. ATS Effluent Discharge

1. ATS effluent shall comply with all provisions and prohibitions in this General Permit, specifically the NELs.

2. NELs for discharges from an ATS:

   a. Turbidity of all ATS discharges shall be less than 10 NTU for daily flow-weighted average of all samples and 20 NTU for any single sample.

   b. Residual Chemical shall be < 10% of MATC[7] for the most sensitive species of the chemical used.

[7] The Maximum Allowable Threshold Concentration (MATC) is the allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity testing conducted by an independent, third-party laboratory. The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.

3. If an analytical effluent sampling result exceeds the turbidity NEL (as listed in Table 1), the discharger is in violation of this General Permit and shall electronically file the results in violation within 24-hours of obtaining the results.

4. If ATS effluent is authorized to discharge into a sanitary sewer system, the discharger shall comply with any pre-treatment requirements applicable for that system. The discharger shall include any specific criteria required by the municipality in the ATS Plan.

5. Compliance Storm Event:

   Discharges of storm water from ATS shall comply with applicable NELs (above) unless the storm event causing the discharges is determined after the fact to be equal to or larger than the Compliance Storm Event (expressed in inches of rainfall). The Compliance Storm Event for ATS discharges is the 10 year, 24 hour storm, as determined using these maps:

   http://www.wrcc.dri.edu/pcpnfreq/nca10y24.gif
   http://www.wrcc.dri.edu/pcpnfreq/sca10y24.gif

   This exemption is dependent on the submission of rain gauge data verifying the storm event is equal to or larger than the Compliance Storm.

J. Operation and Maintenance Plan

1. Each Project shall have a site-specific Operation and Maintenance (O&M) Manual covering the procedures required to install, operate and maintain the ATS.[8]

2. The O&M Manual shall only be used in conjunction with appropriate project-specific design specifications that describe the system configuration and operating parameters.

3. The O&M Manual shall have operating manuals for specific pumps, generators, control systems,and other equipment.

K. Sampling and Reporting Quality Assurance/ Quality Check (QA/QC) Plan

4. A project-specific QA/QC Plan shall be developed for each project. The QA/QC Plan shall include at a minimum:

   a. Calibration – Calibration methods and frequencies for all system and field instruments shall be specified.

[8] The manual is typically in a modular format covering generalized procedures for each component that is utilized in a particular system.

b. Method Detection Limits (MDLs) – The methods for determining MDLs shall be specified for each residual coagulant measurement method. Acceptable minimum MDLs for each method, specific to individual coagulants, shall be specified.

c. Laboratory Duplicates – Requirements for monthly laboratory duplicates for residual coagulant analysis shall be specified.

L. Personnel Training

1. Operators shall have training specific to using an ATS and liquid coagulants for storm water discharges in California.

2. The training shall be in the form of a formal class with a certificate and requirements for testing and certificate renewal.

3. Training shall include a minimum of eight hours classroom and 32 hours field training. The course shall cover the following topics:

   a. Coagulation Basics –Chemistry and physical processes

   b. ATS System Design and Operating Principles

   c. ATS Control Systems

   d. Coagulant Selection – Jar testing, dose determination, etc.

   e. Aquatic Safety/Toxicity of Coagulants, proper handling and safety

   f. Monitoring, Sampling, and Analysis

   g. Reporting and Recordkeeping

   h. Emergency Response

M. Active Treatment System (ATS) Monitoring Requirements

Any discharger who deploys an ATS on their site shall conduct the following:

1. Visual Monitoring

   a. A designated responsible person shall be on site daily at all times during treatment operations.

b. Daily on-site visual monitoring of the system for proper performance shall be conducted and recorded in the project data log.

   i. The log shall include the name and phone number of the person responsible for system operation and monitoring.

   ii. The log shall include documentation of the responsible person's training.

2. Operational and Compliance Monitoring

   a. Flow shall be continuously monitored and recorded at not greater than 15-minute intervals for total volume treated and discharged.

   b. Influent and effluent pH must be continuously monitored and recorded at not greater than 15-minute intervals.

   c. Influent and effluent turbidity (expressed in NTU) must be continuously monitored and recorded at not greater than 15-minute intervals.

   d. The type and amount of chemical used for pH adjustment, if any, shall be monitored and recorded.

   e. Dose rate of chemical used in the ATS system (expressed in mg/L) shall be monitored and reported 15-minutes after startup and every 8 hours of operation.

   f. Laboratory duplicates – monthly laboratory duplicates for residual coagulant analysis must be performed and records shall be maintained onsite.

   g. Effluent shall be monitored and recorded for residual chemical/additive levels.

   h. If a residual chemical/additive test does not exist and the ATS is operating in a batch treatment mode of operation refer to the toxicity monitoring requirements below.

3. Toxicity Monitoring

   A discharger operating in batch treatment mode shall perform toxicity testing in accordance with the following:

   a. The discharger shall initiate acute toxicity testing on effluent samples representing effluent from each batch prior to discharge.[9] All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHS)

[9] This requirement only requires that the test be initiated prior to discharge.

Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.[10]

b. Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in "Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012" for Fathead minnow, *Pimephales promelas or* Rainbow trout *Oncorhynchus mykiss* may be used as a substitute for fathead minnow.

c. All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.[11]

4. Reporting and Recordkeeping

At a minimum, every 30 days a LRP representing the discharger shall access the State Water Boards Storm Water Mulit-Application and Report Tracking system (SMARTS) and electronically upload field data from the ATS. Records must be kept for three years after the project is completed .

5. Non-compliance Reporting

a. Any indications of toxicity or other violations of water quality objectives shall be reported to the appropriate regulatory agency as required by this General Permit.

b. Upon any measurements that exceed water quality standards, the system operator shall immediately notify his supervisor or other responsible parties, who shall notify the Regional Water Board.

c. If any monitoring data exceeds any applicable NEL in this General Permit, the discharger shall electronically submit a NEL Violation Report to the State Water Board within 24 hours after the NEL exceedance has been identified.

i. ATS dischargers shall certify each NEL Violation Report in accordance with the Special Provisions for Construction Activity in this General Permit.

ii. ATS dischargers shall retain an electronic or paper copy of each NEL Violation Report for a minimum of three years after the date the annual report is filed.

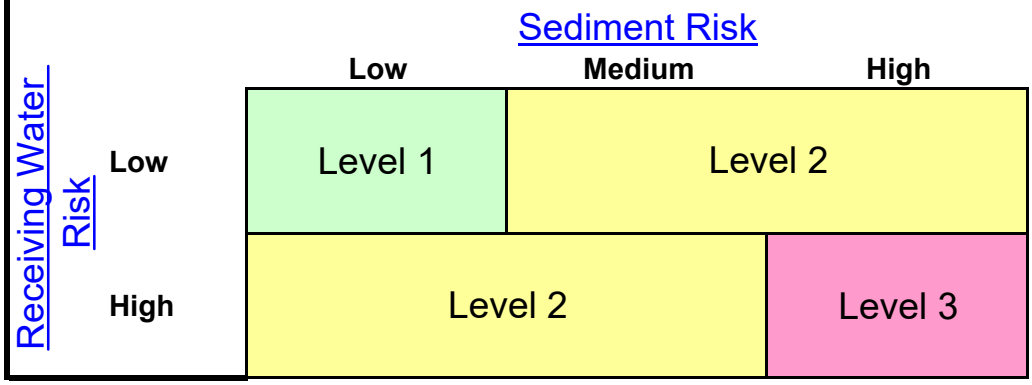
iii. ATS dischargers shall include in the NEL Violation Report:

[10] http://www.dhs.ca.gov/ps/ls/elap/pdf/FOT_Desc.pdf.
[11] http://www.epa.gov/waterscience/methods/wet/.

(1) The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as “less than the method detection limit”);

(2) The date, place, time of sampling, visual observation (inspections), and/or measurements, including precipitation; and

(3) A description of the current onsite BMPs, and the proposed corrective actions taken to manage the NEL exceedance.



iv. Compliance Storm Exemption - In the event that an applicable NEL has been exceeded during a storm event equal to or larger than the Compliance Storm Event, ATS dischargers shall report the on-site rain gauge reading and nearby governmental rain gauge readings for verification.

	A	B	C
1	**Sediment Risk Factor Worksheet**		**Entry**
2	**A) R Factor**		
3	Analyses of data indicated that when factors other than rainfall are held constant, soil loss is directly proportional to a rainfall factor composed of total storm kinetic energy (E) times the maximum 30-min intensity (I30) (Wischmeier and Smith, 1958). The numerical value of R is the average annual sum of EI30 for storm events during a rainfall record of at least 22 years. "Isoerodent" maps were developed based on R values calculated for more than 1000 locations in the Western U.S. Refer to the link below to determine the R factor for the project site.		
4	http://cfpub.epa.gov/npdes/stormwater/LEW/lewCalculator.cfm		
5	**R Factor Value**		0
6	**B) K Factor (weighted average, by area, for all site soils)**		
7	The soil-erodibility factor K represents: (1) susceptibility of soil or surface material to erosion, (2) transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff even though these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high rates and large volumes of runoff. Use Site-specific data must be submitted.		
8	Site-specific K factor guidance		
9	**K Factor Value**		0
10	**C) LS Factor (weighted average, by area, for all slopes)**		
11	The effect of topography on erosion is accounted for by the LS factor, which combines the effects of a hillslope-length factor, L, and a hillslope-gradient factor, S. Generally speaking, as hillslope length and/or hillslope gradient increase, soil loss increases. As hillslope length increases, total soil loss and soil loss per unit area increase due to the progressive accumulation of runoff in the downslope direction. As the hillslope gradient increases, the velocity and erosivity of runoff increases. Use the LS table located in separate tab of this spreadsheet to determine LS factors. Estimate the weighted LS for the site prior to construction.		
12	LS Table		
13	**LS Factor Value**		0
14			
15	**Watershed Erosion Estimate (=RxKxLS) in tons/acre**		0
16	**Site Sediment Risk Factor**		**Low**
17	Low Sediment Risk: < 15 tons/acre		
18	Medium Sediment Risk: >=15 and <75 tons/acre		
19	High Sediment Risk: >= 75 tons/acre

Soil Erodibility Factor (K)

The K factor can be determined by using the nomograph method, which requires that a particle size analysis (ASTM D-422) be done to determine the percentages of sand, very fine sand, silt and clay. Use the figure below to determine appropriate K value.

Erickson triangular nomograph used to estimate soil erodibility (K) factor.
The figure above is the USDA nomograph used to determine the K factor for a soil, based on its texture (% silt plus very fine sand, % sand, % organic matter, soil structure, and permeability). *Nomograph from Erickson 1977 as referenced in Goldman et. al., 1986.*

LS Factors for Construction Sites. *Table from Renard et. al., 1997.*

APPENDIX 2:
Post-Construction Water Balance Performance Standard Spreadsheet

The discharger shall submit with their Notice of Intent (NOI) the following information to demonstrate compliance with the New and Re-Development Water Balance Performance Standard.

Map Instructions

The discharger must submit a small-scale topographic map of the site to show the existing contour elevations, pre- and post-construction drainage divides, and the total length of stream in each watershed area. Recommended scales include 1 in. = 20 ft., 1 in. = 30 ft., 1 in. = 40 ft., or 1 in = 50 ft. The suggested contour interval is usually 1 to 5 feet, depending upon the slope of the terrain. The contour interval may be increased on steep slopes. Other contour intervals and scales may be appropriate given the magnitude of land disturbance.

Spreadsheet Instructions

The intent of the spreadsheet is to help dischargers calculate the project-related increase in runoff volume and select impervious area and runoff reduction credits to reduce the project-related increase in runoff volume to pre-project levels.

The discharger has the option of using the spreadsheet (**Appendix 2.1)** or a more sophisticated, watershed process-based model (e.g. Storm Water Management Model, Hydrological Simulation Program Fortran) to determine the project-related increase in runoff volume.

In* Appendix 4.1**, ***you must complete the worksheet for each land use/soil type combination for each project sub-watershed.

Steps 1 through 9 pertain specifically to the Runoff Volume Calculator:

Step 1: Enter the county where the project is located in cell H3.

Step 2: Enter the soil type in cell H6.

Step 3: Enter the existing pervious (dominant) land use type in cell H7.

Step 4: Enter the proposed pervious (dominant) land use type in cell H8.

Step 5: Enter the total project site area in cell H11 or J11.

Step 6: Enter the sub-watershed area in cell H12 or J12.

Step 7: Enter the existing rooftop area in cell H17 or J17, the existing non-rooftop impervious area in cell H18 or J18, the proposed rooftop area in cell H19 or J19, and the proposed non-rooftop impervious area in cell H20 or J20

Step 8: Work through each of the impervious area reduction credits and claim credits where applicable. Volume that cannot be addressed using non-structural practices must be captured in structural practices and approved by the Regional Water Board.

Step 9: Work through each of the impervious volume reduction credits and claim credits where applicable. Volume that cannot be addressed using non-structural practices must be captured in structural practices and approved by the Regional Water Board.

Non-structural Practices Available for Crediting

Porous Pavement Credit Worksheet

Please fill out a porous pavement credit worksheet for each project sub-watershed.

For the PROPOSED Development:

Proposed Porous Pavement	Runoff Reduction*	Fill in either Acres or SqFt		Equivalent Acres
		In SqFt.	In Acres	
Area of **Brick without Grout** on less than 12 inches of base with at least 20% void space over soil	0.45			0.00
Area of **Brick without Grout** on more than 12 inches of base with at least 20% void space over soil	0.90			0.00
Area of **Cobbles** less than 12 inches deep and over soil	0.30			0.00
Area of **Cobbles** less than 12 inches deep and over soil	0.60			0.00
Area of **Reinforced Grass Pavement** on less than 12 inches of base with at least 20% void space over soil	0.45			0.00
Area of **Reinforced Grass Pavement** on at least 12 inches of base with at least 20% void space over soil	0.90			0.00
Area of **Porous Gravel Pavement** on less than 12 inches of base with at least 20% void space over soil	0.38			0.00
Area of **Porous Gravel Pavement** on at least 12 inches of base with at least 20% void space over soil	0.75			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with less than 4 inches of gravel base (washed stone)	0.40			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 4 to 8 inches of gravel base (washed stone)	0.60			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 8 to 12 inches of gravel base (washed stone)	0.80			0.00
Area of **Poured Porous Concrete or Asphalt Pavement** with 12 or more inches of gravel base (washed stone)	1.00			0.00

Tree Planting Credit Worksheet
Please fill out a tree canopy credit worksheet for each project sub-watershed.

Tree Canopy Credit Criteria	Number of Trees Planted	Credit (acres)
Number of proposed evergreen trees to be planted (credit = number of trees x 0.005)*	0	0.00
Number of proposed deciduous trees to be planted (credit = number of trees x 0.0025)*		0.00
	Square feet Under Canopy	
Square feet under an existing tree canopy, that will remain on the property, with an average diameter at 4.5 ft above grade (i.e., diameter at breast height or DBH) is LESS than 12 in diameter.		0.00
Square feet under an existing tree canopy that will remain on the property, with an average diameter at 4.5 ft above grade (i.e., diameter at breast height or DBH) is 12 in diameter or GREATER.		0.00
Please describe below how the project will ensure that these trees will be maintained.

Downspout Disconnection Credit Worksheet

Please fill out a downspout disconnection credit worksheet for each project subwatershed. If you answer yes to all questions, all rooftop area draining to each downspout will be subtracted from your proposed rooftop impervious coverage.

Downspout Disconnection Credit Criteria					
Do downspouts and any extensions extend at least six feet from a basement and two feet from a crawl space or concrete slab?				○ Yes	◉ No
Is the area of rooftop connecting to each disconnected downspout 600 square feet or less?				○ Yes	◉ No
Is the roof runoff from the design storm event fully contained in a raised bed or planter box or does it drain as sheet flow to a landscaped area large enough to contain the roof runoff from the design storm event?				○ Yes	◉ No
The Stream Buffer and/or Vegetated Swale credits **will not** be taken in this sub-watershed area?				○ Yes	◉ No
Percentage of existing	0.00	Acres	of rooftop surface has disconnected downspouts		
Percentage of the proposed	0.00	Acres	of rooftop surface has disconnected downspouts	50	
				Return to Calculator	

Impervious Area Disconnection Credit Worksheet

Please fill out an impervious area disconnection credit worksheet for each project sub-watershed. If you answer yes to all questions, all non-rooftop impervious surface area will be subtracted from your proposed non-rooftop impervious coverage.

Non-Rooftop Disconnection Credit Criteria	Response
Is the maximum contributing impervious flow path length less than 75 feet or, if equal or greater than 75 feet, is a storage device (e.g. French drain, bioretention area, gravel trench) implemented to achieve the required disconnection length?	◉ Yes ○ No
Is the impervious area to any one discharge location less than 5,000 square feet?	◉ Yes ○ No
The Stream Buffer credit **will not** be taken in this sub-watershed area?	◉ Yes ○ No

Percentage of existing	0.00	Acres non-rooftop surface area disconnected	
Percentage of the proposed	0.00	Acres non-rooftop surface area disconnected	70

Return to Calculator

Green Roof Credit Worksheet

Please fill out a greenroof credit worksheet for each project sub-watershed. If you answer yes to all questions, 70% of the greenroof area will be subtracted from your proposed rooftop impervious coverage.

Green Roof Credit Criteria				Response
Is the roof slope less than 15% or does it have a grid to hold the substrate in place until it forms a thick vegetation mat?				◉ Yes ○ No
Has a professional engineer assessed the necessary load reserves and designed a roof structure to meet state and local codes?				◉ Yes ○ No
Is the irrigation needed for plant establishment and/or to sustain the green roof during extended dry periods, is the source from stored, recycled, reclaimed, or reused water?				◉ Yes ○ No
Percentage of existing	0.00	Acres	rooftop surface area in greenroof	
Percentage of the proposed	0.00	Acres	rooftop surface area in greenroof	

Return to Calculator

Stream Buffer Credit Worksheet

Please fill out a stream buffer credit worksheet for each project sub-watershed. If you answer yes to all questions, you may subtract all impervious surface draining to each stream buffer that has not been addressed using the Downspout and/or Impervious Area Disconnection credits.

Stream Buffer Credit Criteria				Response
Does runoff enter the floodprone width* or within 500 feet (whichever is larger) of a stream channel as sheet flow**?				○ Yes ◉ No
Is the contributing overland slope 5% or less, or if greater than 5%, is a level spreader used?				○ Yes ◉ No
Is the buffer area protected from vehicle or other traffic barriers to reduce compaction?				○ Yes ◉ No
Will the stream buffer be maintained in an ungraded and uncompacted condition and will the vegetation be maintained in a natural condition?				○ Yes ◉ No
Percentage of existing	0.00	Acres	impervious surface area draining into a stream buffer:	
Percentage of the proposed	0.00	Acres	impervious surface area that will drain into a stream buffer:	
Please describe below how the project will ensure that the buffer areas will remain in ungraded and uncompacted condition and that the vegetation will be maintained in a natural condition.				

Return to Calculator

* floodprone width is the width at twice the bankfull depth.
** the maximum contributing length shall be 75 feet for impervious area

Vegetated Swale Credit Worksheet

Please fill out a vegetated swale worksheet for each project subwatershed. If you answer yes to all questions, you may subtract all impervious surface draining to each stream buffer that has not been addressed using the Downspout Disconnection credit.

Vegetated Swale Credit Criteria

Have all vegetated swales been designed in accordance with Treatment Control BMP 30 (TC-30 - Vegetated Swale) from the California Stormwater BMP Handbook, New Development and Redevelopment (available at www.cabmphandbooks.com)?	○ Yes ◉ No
Is the maximum flow velocity for runoff from the design storm event less than or equal to 1.0 foot per second?	○ Yes ◉ No

Percentage of existing	0.00	Acres of impervious area draining to a vegetated swale	
Percentage of the proposed	0.00	Acres of impervious area draining to a vegetated swale	

Return to Calculator

Rain Barrel/Cistern Credit Worksheet

Please fill out a rain barrel/cistern worksheet for each project sub-watershed.

Rain Barrel/Cistern Credit Criteria	Response
Total number of rain barrel(s)/cisterns	
Average capacity of rain barrel(s)/cistern(s) (in gallons)	
Total capacity rain barrel(s)/cistern(s) (in cu ft) [1]	0

[1] accounts for 10% loss

Return to Calculator

Please fill out a soil quality worksheet for each project sub-watershed.

	Response
Will the landscaped area be lined with an impervious membrane?	
Will the soils used for landscaping meet the ideal bulk densities listed in Table 1 below? [1]	○ Yes ◉ No
If you answered yes to the question above, and you know the area-weighted bulk density within the top 12 inches for soils used for landscaping (in g/cm^3)* , fill in the cell to the right and skip to cell G11. If not select from the drop-down menu in G10.	1.3
If you answered yes to the question above, but you do not know the exact bulk density, which of the soil types in the drop down menu to the right best describes the top 12 inches for soils used for landscaping (in g/cm^3).	Sandy loams, loams
What is the average depth of your landscaped soil media meeting the above criteria (inches)?	12
What is the total area of the landscaped areas meeting the above criteria (in acres)?	2.97

Return to Calculator

Table 1

Sands, loamy sands	<1.6
Sandy loams, loams	<1.4
Sandy clay loams, loams, clay loams	<1.4
Silts, silt loams	<1.3
Silt loams, silty clay loams	<1.1
Sandy clays, silty clays, some clay loams (35-45% clay)	<1.1
Clays (>45% clay)	<1.1

Porosity (%) 50.94%

Mineral grains in many soils are mainly quartz and feldspar, so 2.65 a good average for particle density. To determine percent porosity, use the formula: Porosity (%) = (1-Bulk Density/2.65) X 100

* To determine how to calculate density see: http://www.globe.gov/tctg/bulkden.pdf?sectionID=94

APPENDIX 3
Bioassessment Monitoring Guidelines

Bioassessment monitoring is required for projects that meet all of the following criteria:

1. The project is rated Risk Level 3 or LUP Type 3
2. The project directly discharges runoff to a freshwater wadeable stream (or streams) that is either: (a) listed by the State Water Board or USEPA as impaired due to sediment, and/or (b) tributary to any downstream water body that is listed for sediment; and/or have the beneficial use SPAWN & COLD & MIGRATORY
3. Total project-related ground disturbance exceeds 30 acres.

For all such projects, the discharger shall conduct bioassessment monitoring, as described in this section, to assess the effect of the project on the biological integrity of receiving waters.
Bioassessment shall include:

1. The collection and reporting of specified instream biological data
2. The collection and reporting of specified instream physical habitat data

<u>Bioassessment Exception</u>
If a site qualifies for bioassessment, but construction commences out of an index period for the site location, the discharger shall:

1. Receive Regional Water Board approval for the sampling exception
2. Make a check payable to: Cal State Chico Foundation (SWAMP Bank Account) or San Jose State Foundation (SWAMP Bank Account) and include the WDID# on the check for the amount calculated for the exempted project.
3. Send a copy of the check to the Regional Water Board office for the site's region
4. Invest **7,500.00 X The number of samples required** into the SWAMP program as compensation (upon Regional Water Board approval).
5. Conduct bioassessment monitoring, as described in Appendix 4
6. Include the collection and reporting of specified instream biological data and physical habitat
7. Use the bioassessment sample collection and Quality Assurance & Quality Control (QA/QC) protocols developed by the State of California's Surface Water Ambient Monitoring Program (SWAMP)

<u>Site Locations and Frequency</u>
Macroinvertebrate samples shall be collected both before ground disturbance is initiated and after the project is completed. The "after" sample(s) shall be collected after at least one winter season resulting in surface runoff has transpired after project-related ground disturbance has ceased. "Before" and "after" samples shall be collected both upstream and downstream of the project's

discharge. Upstream samples should be taken immediately before the sites outfall and downstream samples should be taken immediately after the outfall (when safe to collect the samples). Samples should be collected for each freshwater wadeable stream that is listed as impaired due to sediment, or tributary to a water body that is listed for sediment. Habitat assessment data shall be collected concurrently with all required macroinvertebrate samples.

Index Period (Timing of Sample Collection)
Macroinvertebrate sampling shall be conducted during the time of year (i.e., the "index period") most appropriate for bioassessment sampling, depending on ecoregion. This map is posted on the State Water Board's Website: http://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.shtml

Field Methods for Macroinvertebrate Collections
In collecting macroinvertebrate samples, the discharger shall use the "Reachwide Benthos (Multi-habitat) Procedure" specified in *Standard Operating Procedures for Collecting Benthic Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California* (Ode 2007).[1]

Physical - Habitat Assessment Methods
The discharger shall conduct, concurrently with all required macroinvertebrate collections, the "Full" suite of physical habitat characterization measurements as specified in *Standard Operating Procedures for Collecting Benthic Macroinvertebrate Samples and Associated Physical and Chemical Data for Ambient Bioassessments in California* (Ode 2007), and as summarized in the Surface Water Ambient Monitoring Program's *Stream Habitat Characterization Form — Full Version*.

Laboratory Methods
Macroinvertebrates shall be identified and classified according to the Standard Taxonomic Effort (STE) Level I of the Southwestern Association of Freshwater Invertebrate Taxonomists (SAFIT),[2] and using a fixed-count of 600 organisms per sample.

Quality Assurance
The discharger or its consultant(s) shall have and follow a quality assurance (QA) plan that covers the required bioassessment monitoring. The QA plan shall include, or be supplemented to include, a specific requirement for external QA checks (i.e., verification of taxonomic identifications and correction of data where

[1] This document is available on the Internet at: ~~http://www.swrcb.ca.gov/swamp/docs/phab_sopr6.pdf~~. http://swamp.mpsl.mlml.calstate.edu/wp-content/uploads/2009/04/swamp_sop_bioassessment_collection_020107.pdf.

[2] The current SAFIT STEs (28 November 2006) list requirements for both the Level I and Level II taxonomic effort, and are located at: ~~http://www.swrcb.ca.gov/swamp/docs/safit/ste_list.pdf~~ http://www.safit.org/Docs/ste_list.pdf. When new editions are published by SAFIT, they will supersede all previous editions. All editions will be posted at the State Water Board's SWAMP website.

errors are identified). External QA checks shall be performed on one of the discharger's macroinvertebrate samples collected per calendar year, or ten percent of the samples per year (whichever is greater). QA samples shall be randomly selected. The external QA checks shall be paid for by the discharger, and performed by the California Department of Fish and Game's Aquatic Bioassessment Laboratory. An alternate laboratory with equivalent or better expertise and performance may be used if approved in writing by State Water Board staff.

Sample Preservation and Archiving

The original sample material shall be stored in 70 percent ethanol and retained by the discharger until: 1) all QA analyses specified herein and in the relevant QA plan are completed; and 2) any data corrections and/or re-analyses recommended by the external QA laboratory have been implemented. The remaining subsampled material shall be stored in 70 percent ethanol and retained until completeness checks have been performed according to the relevant QA plan. The identified organisms shall be stored in 70 percent ethanol, in separate glass vials for each final ID taxon. (For example, a sample with 45 identified taxa would be archived in a minimum of 45 vials, each containing all individuals of the identified taxon.) Each of the vials containing identified organisms shall be labeled with taxonomic information (i.e., taxon name, organism count) and collection information (i.e., site name/site code, waterbody name, date collected, method of collection). The identified organisms shall be archived (i.e., retained) by the discharger for a period of not less than three years from the date that all QA steps are completed, and shall be checked at least once per year and "topped off" with ethanol to prevent desiccation. The identified organisms shall be relinquished to the State Water Board upon request by any State Water Board staff.

Data Submittal

The macroinvertebrate results (i.e., taxonomic identifications consistent with the specified SAFIT STEs, and number of organisms within each taxa) shall be submitted to the State Water Board in electronic format. The State Water Board's Surface Water Ambient Monitoring Program (SWAMP) is currently developing standardized formats for reporting bioassessment data. All bioassessment data collected after those formats become available shall be submitted using the SWAMP formats. Until those formats are available, the biological data shall be submitted in MS-Excel (or equivalent) format.[3]

The physical/habitat data shall be reported using the standard format titled *SWAMP Stream Habitat Characterization Form — Full Version*.[4]

[3] Any version of Excel, 2000 or later, may be used.
[4] Available at: http://www.waterboards.ca.gov/water_issues/programs/swamp/docs/reports/fieldforms_fullversion052908.pdf

Invasive Species Prevention

In conducting the required bioassessment monitoring, the discharger and its consultants shall take precautions to prevent the introduction or spread of aquatic invasive species. At minimum, the discharger and its consultants shall follow the recommendations of the California Department of Fish and Game to minimize the introduction or spread of the New Zealand mudsnail.[5]

[5] Instructions for controlling the spread of NZ mudsnails, including decontamination methods, can be found at: http://www.dfg.ca.gov/invasives/mudsnail/

General Construction Storm Water Permits:
Waste load allocations will be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board.

- Dry-weather Implementation Non-storm water flows authorized by the General Permit for Storm Water Discharges Associated with Construction Activity (Water Quality Order No. 99-08 DWQ), or any successor order, are exempt from the dry-weather waste load allocation equal to zero as long as they comply with the provisions of sections C.3 and A.9 of the Order No. 99-08 DWQ, which state that these authorized non-storm discharges shall be:
  (1) infeasible to eliminate
  (2) comply with BMPs as described in the Storm Water Pollution Prevention Plan prepared by the permittee, and
  (3) not cause or contribute to a violation of water quality standards, or comparable provisions in any successor order.
  Unauthorized non-storm water flows are already prohibited by Order No. 99-08 DWQ.
- Wet-weather Implementation Within seven years of the effective date of the TMDL, the construction industry will submit the results of BMP effectiveness studies to determine BMPs that will achieve compliance with the final waste load allocations assigned to construction storm water permittees.
- Regional Board staff will bring the recommended BMPs before the Regional Board for consideration within eight years of the effective date of the TMDL.
- General construction storm water permittees will be considered in compliance with final waste load allocations if they implement these Regional Board approved BMPs. All permittees must implement the approved BMPs within nine years of the effective date of the TMDL. If no effectiveness studies are conducted and no BMPs are approved by the Regional Board within eight years of the effective date of the TMDL, each general construction storm water permit holder will be subject to site-specific BMPs and monitoring requirements to demonstrate compliance with final waste load allocations.

Region 4 Calleaguas Creek-OC Pesticides, PCBs, and Siltation

Pleasant Valley (Calleguas)	230.0	1720.0	1289.0	1.3
Pleasant Valley (Revolon)	230.0	1720.0	1289.0	1.3

- General Construction permittees are assigned a dry weather wasteload allocation equal to the average dry weather critical condition flow rate multiplied by the numeric target for each constituent. Waste load allocations apply in the receiving water at the base of each subwatershed. Dry weather allocations apply when instream flow rates are below the 86th percentile flow and there has been no measurable precipitation in the previous 24 hours.
- Because wet weather flows transport a large mass of salts at low concentrations, these dischargers meet water quality objectives during wet weather.
- Interim limits are assigned for dry weather discharges from areas covered by NPDES stormwater permits to allow time to implement appropriate actions. The interim limits are assigned as concentration based receiving water limits set to the 95th percentile of the discharger data as a monthly average limit except for chloride. The 95th percentile for chloride was 267 mg/L which is higher than the recommended criteria set forth in the Basin Plan for protection of sensitive beneficial uses including aquatic life. Therefore, the interim limit for chloride for Permitted Stormwater Dischargers is set equal to 230 mg/L to ensure protection of sensitive beneficial uses in the Calleguas Creek watershed.

Region 4 San Gabriel River and Tributaries-Metals and Selenium

Region 4 San Gabriel River and Tributaries Source: Construction Stormwater Dischargers TMDL Completion Date: 3 2007 TMDL Type: Creek	**Pollutant Stressor**	**Wet weather Allocations**	**Dry Weather Allocations**	**% of Watershed**

San Gabriel Reach 2	Lead (Pb)	0.7% * 166 µg/l * Daily Storm Vol	N/A	0.7%
San Gabriel Reach 2	Lead (Pb) Mass based	0.8 kg/d	N/A	0.7%
Coyote Creek	Copper (Cu)	0.285 kg/d	0	5.0%
Coyote Creek	Lead (Pb)	1.70 kg/d	N/A	5.0%
Coyote Creek	Zinc (Zn)	2.4 kg/d	N/A	5.0%
San Jose Creek Reach 1 and 2	Selenium	5 µg/L	5 µg/L	5.0%

Wet-weather allocations for lead in San Gabriel River Reach 2. Concentration-based allocations apply to non-stormwater NPDES discharges. Stormwater allocations are expressed as a percent of load duration curve. Mass-based values presented in table are based on a flow of 260 cfs (daily storm volume = 6.4 $x10^{8}$ liters).

There are 1555 acres of water in the entire watershed, 37.4 acres of water in the Reach 1 subwatershed (2.4%), and 269 acres in the Coyote Creek subwatershed (17%).

General Construction Storm Water Permits

Waste load allocations for the general construction storm water permits may be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board. An estimate of direct atmospheric deposition is developed based on the percent area of surface water in the watershed. Approximately 0.4% of the watershed area draining to San Gabriel River Reach 2 is comprised of water and approximately 0.2% of the watershed area draining to Coyote Creek is comprised of water.

Region 4 The Harbor Beaches of Ventura County-Bacteria

The TMDL has a multi-part numeric target based on the bacteriological water quality objectives for marine water to protect the water contact recreation use. These targets are the most appropriate indicators of public health risk in recreational waters. Bacteriological objectives are set forth in Chapter 3 of the Basin Plan. The objectives are based on four bacteria indicators and include both geometric mean limits and single sample limits. The Basin Plan objectives that serve as the numeric targets for this TMDL are:

The General NPDES Construction permit is seen as a minor contributor and is given no allocation

General NPDES permits, individual NPDES permits, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR permittees in the Channel Islands Harbor subwatershed are assigned WLAs of zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean. Any future enrollees under a general NPDES permit, individual NPDES permit, the Statewide Industrial Storm Water General Permit, the Statewide Construction Activity Storm Water General Permit, and WDR will also be subject to a WLA of zero (0) days of allowable exceedances.

Region 4 Resolution No. 03-009 Los Angeles River and Tributaries-Nutrients

Minor Point Sources
Waste loads are allocated to minor point sources enrolled under NPDES or WDR permits including but not limited to Tapia WRP, Whittier Narrows WRP, Los Angeles Zoo WRP, industrial and construction stormwater, and municipal storm water and urban runoff from municipal separate storm sewer systems (MS4s)

Region 4 Minor Point Sources for NPDES/WDR Permits TMDL Completion Date: 7 10 2003 TMDL Type: River	Pollutant Stressor/WLA				
	Total Ammonia (NH_3)		**Nitrate-nitrogen (NO_3-N)**	**Nitrite-nitrogen (NO_2-N)**	**NO_3-N + NO_3-N**

LA River Above Los Angeles-Glendale WRP (LAG)	4.7	1.6	8.0	1.0	8.0
LA River Below LAG	8.7	2.4	8.0	1.0	8.0
Los Angeles Tributaries	10.1	2.3	8.0	1.0	8.0

Malibu Creek Attachment A to Resolution No. 2004-019R-Bacteria

12 13 2004 The WLAs for permittees under the NPDES General Stormwater Construction Permit are zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean.

Region 4 Marina del Rey Harbor, Mothers' Beach and Back Basins

Attachment A to Resolution No. 2003-012-Bacteria

8 7 2003 As discussed in "Source Analysis", discharges from general NPDES permits, general industrial storm water permits and general construction storm water permits are not expected to be a significant source of bacteria. Therefore, the WLAs for these discharges are zero (0) days of allowable exceedances for all three time periods and for the single sample limits and the rolling 30-day geometric mean. Any future enrollees under a general NPDES permit, general industrial storm water permit or general construction storm water permit within the MdR Watershed will also be subject to a WLA of zero days of allowable exceedances.

Region 4 San Gabriel River and Tributaries-Metals and Selenium

Dry Weather Selenium WLA
A zero WLA is assigned to the industrial and construction stormwater permits during dry weather. Non-storm water discharges are already prohibited or restricted by existing general permits.

Region 4 General Construction Permittees TMDL Completion Date: 7 13 2006 TMDL Type: River	**Total Recoverable Metals (kg/day)**		
	Copper (Cu) Kg/day	**Lead (Pb) Kg/day**	**Zinc (Zn) Kg/day**
San Gabriel River Reach 2 and upstream reaches/tributaries	**XXXX**	Daily storm volume x 1.24 µg/L	**XXXX**
Coyote Creek and Tributaries	Daily storm volume x 0.7 µg/L	Daily storm volume x 4.3 µg/L	Daily storm volume x 6.2 µg/L

Each enrollee under the general construction stormwater permit receives a WLA on a per acre basis

Region 4 General Construction Permittees TMDL Completion Date: 7 13 2006 TMDL Type: River	**Total Recoverable Metals (kg/day/acre)**		
	Copper (Cu) Kg/acre/day	**Lead (Pb) Kg/acre/day**	**Zinc (Zn) Kg/acre/day**
San Gabriel River Reach 2 and upstream reaches/tributaries	**XXXX**	Daily storm volume x 0.56 µg/L	**XXXX**

Coyote Creek and Tributaries	Daily storm volume x 0.12 µg/L	Daily storm volume x 0.70 µg/L	Daily storm volume x 1.01 µg/L

For the general industrial and construction storm water permits, the daily storm volume is measured at USGS station 11085000 for discharges to Reach 2 and above and at LACDPW flow gauge station F354-R for discharges to Coyote Creek.

General construction storm water permits
WLAs will be incorporated into the State Board general permit upon renewal or into a watershed-specific general permit developed by the Regional Board.

Dry-weather implementation
Non-storm water flows authorized by the General Permit for Storm Water Discharges Associated with Construction Activity (NPDES Permit No. CAS000002), or any successor permit, are exempt from the dry-weather WLA equal to zero as long as they comply with the provisions of sections C.3.and A.9 of the Order No. 99-08 DWQ, which state that these authorized non-storm discharges shall be (1) infeasible to eliminate (2) comply with BMPs as described in the Storm Water Pollution Prevention Plan prepared by the permittee, and (3) not cause or contribute to a violation of water quality standards, or comparable provisions in any successor order. Unauthorized non-storm water flows are already prohibited by Permit No. CAS000002.

Upon permit issuance, renewal, or re-opener
Non-storm water flows not authorized by Order No. 99-08 DWQ, or any successor order, shall achieve dry-weather WLAs. WLAs shall be expressed as NPDES water quality-based effluent limitations specified in accordance with federal regulations and state policy on water quality control. Effluent limitations may be expressed as permit conditions, such as the installation, maintenance, and monitoring of Regional Board-approved BMPs.

Six years from the effective date of the TMDL
The construction industry will submit the results of wet-weather BMP effectiveness studies to the Los Angeles Regional Board for consideration. In the event that no effectiveness studies are conducted and no BMPs are approved, permittees shall be subject to site-specific BMPs and monitoring to demonstrate BMP effectiveness.

Seven years from the effective date of the TMDL
The Los Angeles Regional Board will consider results of the wet weather BMP effectiveness studies and consider approval of BMPs.

Eight years from the effective date of the TMDL
All general construction storm water permittees shall implement Regional Board-approved BMPs.

Total Maximum Daily Loads (TMDLs) for San Diego Creek,

Organochlorine Compounds TMDLs Implementation Tasks and Schedule

Regional Board staff shall develop a SWPPP Improvement Program that identifies the Regional Board's expectations with respect to the content of SWPPPs, including documentation regarding the selection and implementation of BMPs, and a sampling and analysis plan. The Improvement Program shall include specific guidance regarding the development and implementation of monitoring plans, including the constituents to be monitored, sampling frequency and analytical protocols. The SWPPP Improvement Program shall be completed by (*the date of OAL approval of this BPA*). ***No later than two months*** from completion of the Improvement Program, Board staff shall assure that the requirements of the Program are communicated to interested parties, including dischargers with existing authorizations under the General Construction Permit. Existing, authorized dischargers shall revise their project SWPPPs as needed to address the Program requirements as soon as possible but ***no later than (three months of completion of the SWPPP Improvement Program)***. Applicable SWPPPs that do not adequately address the Program requirements shall be considered inadequate and enforcement by the Regional Board shall proceed accordingly. The Caltrans and Orange County MS4 permits shall be revised as needed to assure that the permittees communicate the Regional Board's SWPPP expectations, based on the SWPPP Improvement Program, with the Standard Conditions of Approval.

Appendix 4 Sediment TMDLs

Implemented Sediment TMDLs in California. Construction was listed as a source in all fo these TMDLs in relation to road construction. Although construction was mentioned as a source, it was not given a specific allocation amount. The closest allocation amount would be for the road activity management WLA. **Implementation Phase** – Adoption process by the Regional Board, the State Water Resources Control Board, the Office of Administrative Law, and the US Environmental Protection Agency completed and TMDL being implemented.

APPENDIX 5:
Glossary

Active Areas of Construction
All areas subject to land surface disturbance activities related to the project including, but not limited to, project staging areas, immediate access areas and storage areas. All previously active areas are still considered active areas until final stabilization is complete. [The construction activity Phases used in this General Permit are the Preliminary Phase, Grading and Land Development Phase, Streets and Utilities Phase, and the Vertical Construction Phase.]

Active Treatment System (ATS)
A treatment system that employs chemical coagulation, chemical flocculation, or electrocoagulation to aid in the reduction of turbidity caused by fine suspended sediment.

Acute Toxicity Test
A chemical stimulus severe enough to rapidly induce a negative effect; in aquatic toxicity tests, an effect observed within 96 hours or less is considered acute.

Air Deposition
Airborne particulates from construction activities.

Approved Signatory
A person who has been authorized by the Legally Responsible Person to sign, certify, and electronically submit Permit Registration Documents, Notices of Termination, and any other documents, reports, or information required by the General Permit, the State or Regional Water Board, or U.S. EPA. The Approved Signatory must be one of the following:

1. For a corporation or limited liability company: a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (a) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation or limited liability company; or (b) the manager of the facility if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

2. For a partnership or sole proprietorship: a general partner or the proprietor, respectively;

3. For a municipality, State, Federal, or other public agency: a principal executive officer, ranking elected official, city manager, council president, or any other authorized public employee with managerial responsibility over the

construction or land disturbance project (including, but not limited to, project manager, project superintendent, or resident engineer);

4. For the military: any military officer or Department of Defense civilian, acting in an equivalent capacity to a military officer, who has been designated;

5. For a public university: an authorized university official;

6. For an individual: the individual, because the individual acts as both the Legally Responsible Person and the Approved Signatory; or

7. For any type of entity not listed above (e.g. trusts, estates, receivers): an authorized person with managerial authority over the construction or land disturbance project.

Beneficial Uses
As defined in the California Water Code, beneficial uses of the waters of the state that may be protected against quality degradation include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

Best Available Technology Economically Achievable (BAT)
As defined by USEPA, BAT is a technology-based standard established by the Clean Water Act (CWA) as the most appropriate means available on a national basis for controlling the direct discharge of toxic and nonconventional pollutants to navigable waters. The BAT effluent limitations guidelines, in general, represent the best existing performance of treatment technologies that are economically achievable within an industrial point source category or subcategory.

Best Conventional Pollutant Control Technology (BCT)
As defined by USEPA, BCT is a technology-based standard for the discharge from existing industrial point sources of conventional pollutants including biochemical oxygen demand (BOD), total suspended sediment (TSS), fecal coliform, pH, oil and grease.

Best Professional Judgment (BPJ)
The method used by permit writers to develop technology-based NPDES permit conditions on a case-by-case basis using all reasonably available and relevant data.

Best Management Practices (BMPs)
BMPs are scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants. BMPs also include treatment requirements, operating procedures,

and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Chain of Custody (COC)
Form used to track sample handling as samples progress from sample collection to the analytical laboratory. The COC is then used to track the resulting analytical data from the laboratory to the client. COC forms can be obtained from an analytical laboratory upon request.

Coagulation
The clumping of particles in a discharge to settle out impurities, often induced by chemicals such as lime, alum, and iron salts.

Common Plan of Development
Generally a contiguous area where multiple, distinct construction activities may be taking place at different times under one plan. A plan is generally defined as any piece of documentation or physical demarcation that indicates that construction activities may occur on a common plot. Such documentation could consist of a tract map, parcel map, demolition plans, grading plans or contract documents. Any of these documents could delineate the boundaries of a common plan area. However, broad planning documents, such as land use master plans, conceptual master plans, or broad-based CEQA or NEPA documents that identify potential projects for an agency or facility are not considered common plans of development.

Daily Average Discharge
The discharge of a pollutant measured during any 24-hour period that reasonably represents a calendar day for purposes of sampling. For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged during the day. For pollutants with limitations expressed in other units of measurement (e.g., concentration) the daily discharge is calculated as the average measurement of the pollutant throughout the day (40 CFR 122.2). In the case of pH, the pH must first be converted from a log scale.

Debris
Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

Direct Discharge
A discharge that is routed directly to waters of the United States by means of a pipe, channel, or ditch (including a municipal storm sewer system), or through surface runoff.

Discharger
The Legally Responsible Person (see definition) or entity subject to this General Permit.

Dose Rate (for ATS)
In exposure assessment, dose (e.g. of a chemical) per time unit (e.g. mg/day), sometimes also called dosage.

Drainage Area
The area of land that drains water, sediment, pollutants, and dissolved materials to a common outlet.

Effluent
Any discharge of water by a discharger either to the receiving water or beyond the property boundary controlled by the discharger.

Effluent Limitation
Any numeric or narrative restriction imposed on quantities, discharge rates, and concentrations of pollutants which are discharged from point sources into waters of the United States, the waters of the contiguous zone, or the ocean.

Erosion
The process, by which soil particles are detached and transported by the actions of wind, water, or gravity.

Erosion Control BMPs
Vegetation, such as grasses and wildflowers, and other materials, such as straw, fiber, stabilizing emulsion, protective blankets, etc., placed to stabilize areas of disturbed soils, reduce loss of soil due to the action of water or wind, and prevent water pollution.

Field Measurements
Testing procedures performed in the field with portable field-testing kits or meters.

Final Stabilization
All soil disturbing activities at each individual parcel within the site have been completed in a manner consistent with the requirements in this General Permit.

First Order Stream
Stream with no tributaries.

Flocculants
Substances that interact with suspended particles and bind them together to form flocs.

Good Housekeeping BMPs
BMPs designed to reduce or eliminate the addition of pollutants to construction site runoff through analysis of pollutant sources, implementation of proper handling/disposal practices, employee education, and other actions.

Grading Phase (part of the Grading and Land Development Phase)
Includes reconfiguring the topography and slope including; alluvium removals; canyon cleanouts; rock undercuts; keyway excavations; land form grading; and stockpiling of select material for capping operations.

Hydromodification
Hydromodification is the alteration of the hydrologic characteristics of coastal and non-coastal waters, which in turn could cause degradation of water resources. Hydromodification can cause excessive erosion and/or sedimentation rates, causing excessive turbidity, channel aggradation and/or degradation.

Identified Organisms
Organisms within a sub-sample that is specifically identified and counted.

Inactive Areas of Construction
Areas of construction activity that are not active and those that have been active and are not scheduled to be re-disturbed for at least 14 days.

Index Period
The period of time during which bioassessment samples must be collected to produce results suitable for assessing the biological integrity of streams and rivers. Instream communities naturally vary over the course of a year,and sampling during the index period ensures that samples are collected during a time frame when communities are stable so that year-to-year consistency is obtained. The index period approach provides a cost-effective alternative to year-round sampling. Furthermore, sampling within the appropriate index period will yield results that are comparable to the assessment thresholds or criteria for a given region, which are established for the same index period. Because index periods differ for different parts of the state, it is essential to know the index period for your area.

K Factor
The soil erodibility factor used in the Revised Universal Soil Loss Equation (RUSLE). It represents the combination of detachability of the soil, runoff potential of the soil, and the transportability of the sediment eroded from the soil.

Legally Responsible Person
The Legally Responsible Person (LRP) will typically be the project proponent. The categories of persons or entities that are eligible to serve as the LRP are set forth below. For any construction or land disturbance project where multiple persons or entities are eligible to serve as the LRP, those persons or entities

shall select a single LRP. In exceptional circumstances, a person or entity that qualifies as the LRP may provide written authorization to another person or entity to serve as the LRP. In such a circumstance, the person or entity that provides the authorization retains all responsibility for compliance with the General Permit. Except as provided in category 2(d), a contractor who does not satisfy the requirements of any of the categories below is not qualified to be an LRP.

The following persons or entities may serve as an LRP:

1. A person, company, agency, or other entity that possesses a real property interest (including, but not limited to, fee simple ownership, easement, leasehold, or other rights of way) in the land upon which the construction or land disturbance activities will occur for the regulated site.

2. In addition to the above, the following persons or entities may also serve as an LRP:

    a. For linear underground/overhead projects, the utility company, municipality, or other public or private company or agency that owns or operates the LUP;

    b. For land controlled by an estate or similar entity, the person who has day-to-day control over the land (including, but not limited to, a bankruptcy trustee, receiver, or conservator);

    c. For pollution investigation and remediation projects, any potentially responsible party that has received permission to conduct the project from the holder of a real property interest in the land; or

    d. For U.S. Army Corp of Engineers projects, the U.S. Army Corps of Engineers may provide written authorization to its bonded contractor to serve as the LRP, provided, however, that the U.S. Army Corps of Engineers is also responsible for compliance with the general permit, as authorized by the Clean Water Act or the Federal Facilities Compliance Act.

Likely Precipitation Event
Any weather pattern that is forecasted to have a 50% or greater chance of producing precipitation in the project area. The discharger shall obtain likely precipitation forecast information from the National Weather Service Forecast Office (e.g., by entering the zip code of the project's location at http://www.srh.noaa.gov/forecast).

Maximum Allowable Threshold Concentration (MATC)
The allowable concentration of residual, or dissolved, coagulant/flocculant in effluent. The MATC shall be coagulant/flocculant-specific, and based on toxicity

testing conducted by an independent, third-party laboratory. A typical MATC would be:

The MATC is equal to the geometric mean of the NOEC (No Observed Effect Concentration) and LOEC (Lowest Observed Effect Concentration) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant. The most sensitive species test shall be used to determine the MATC.

Natural Channel Evolution
The physical trend in channel adjustments following a disturbance that causes the river to have more energy and degrade or aggrade more sediment. Channels have been observed to pass through 5 to 9 evolution types. Once they pass though the suite of evolution stages, they will rest in a new state of equilibrium.

Non-Storm Water Discharges
Discharges are discharges that do not originate from precipitation events. They can include, but are not limited to, discharges of process water, air conditioner condensate, non-contact cooling water, vehicle wash water, sanitary wastes, concrete washout water, paint wash water, irrigation water, or pipe testing water.

Non-Visible Pollutants
Pollutants associated with a specific site or activity that can have a negative impact on water quality, but cannot be seen though observation (ex: chlorine). Such pollutants being discharged are not authorized.

Numeric Action Level (NAL)
Level is used as a warning to evaluate if best management practices are effective and take necessary corrective actions. Not an effluent limit.

Original Sample Material
The material (i.e., macroinvertebrates, organic material, gravel, etc.) remaining after the subsample has been removed for identification.

pH
Unit universally used to express the intensity of the acid or alkaline condition of a water sample. The pH of natural waters tends to range between 6 and 9, with neutral being 7. Extremes of pH can have deleterious effects on aquatic systems.

Post-Construction BMPs
Structural and non-structural controls which detain, retain, or filter the release of pollutants to receiving waters after final stabilization is attained.

Preliminary Phase (Pre-Construction Phase - Part of the Grading and Land Development Phase)
Construction stage including rough grading and/or disking, clearing and grubbing operations, or any soil disturbance prior to mass grading.

Project

Qualified SWPPP Developer
Individual who is authorized to develop and revise SWPPPs.

Qualified SWPPP Practitioner
Individual assigned responsibility for non-storm water and storm water visual observations, sampling and analysis, and responsibility to ensure full compliance with the permit and implementation of all elements of the SWPPP, including the preparation of the annual compliance evaluation and the elimination of all unauthorized discharges.

Qualifying Rain Event
Any event that produces 0.5 inches or more precipitation with a 48 hour or greater period between rain events.

R Factor
Erosivity factor used in the Revised Universal Soil Loss Equation (RUSLE). The R factor represents the erosivity of the climate at a particular location. An average annual value of R is determined from historical weather records using erosivity values determined for individual storms. The erosivity of an individual storm is computed as the product of the storm's total energy, which is closely related to storm amount, and the storm's maximum 30-minute intensity.

Rain Event Action Plan (REAP)
Written document, specific for each rain event, that when implemented is designed to protect all exposed portions of the site within 48 hours of any likely precipitation event.

Remaining Sub sampled Material
The material (e.g., organic material, gravel, etc.) that remains after the organisms to be identified have been removed from the subsample for identification. (Generally, no macroinvertebrates are present in the remaining subsampled material, but the sample needs to be checked and verified using a complete Quality Assurance (QA) plan)

Routine Maintenance
Activities intended to maintain the original line and grade, hydraulic capacity, or original purpose of a facility.

Runoff Control BMPs
Measures used to divert runon from offsite and runoff within the site.

Run-on
Discharges that originate offsite and flow onto the property of a separate project site.

Revised Universal Soil Loss Equation (RUSLE)
Empirical model that calculates average annual soil loss as a function of rainfall and runoff erosivity, soil erodibility, topography, erosion controls, and sediment controls.

Sampling and Analysis Plan
Document that describes how the samples will be collected, under what conditions, where and when the samples will be collected, what the sample will be tested for, what test methods and detection limits will be used, and what methods/procedures will be maintained to ensure the integrity of the sample during collection, storage, shipping and testing (i.e., quality assurance/quality control protocols).

Sediment
Solid particulate matter, both mineral and organic, that is in suspension, is being transported, or has been moved from its site of origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Sedimentation
Process of deposition of suspended matter carried by water, wastewater, or other liquids, by gravity. It is usually accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material.

Sediment Control BMPs
Practices that trap soil particles after they have been eroded by rain, flowing water, or wind. They include those practices that intercept and slow or detain the flow of storm water to allow sediment to settle and be trapped (e.g., silt fence, sediment basin, fiber rolls, etc.).

Settleable Solids (SS)
Solid material that can be settled within a water column during a specified time frame. It is typically tested by placing a water sample into an Imhoff settling cone and then allowing the solids to settle by gravity for a given length of time. Results are reported either as a volume (mL/L) or a mass (mg/L) concentration.

Sheet Flow
Flow of water that occurs overland in areas where there are no defined channels where the water spreads out over a large area at a uniform depth.

Site

Soil Amendment
Any material that is added to the soil to change its chemical properties, engineering properties, or erosion resistance that could become mobilized by storm water.

Streets and Utilities Phase
Construction stage including excavation and street paving, lot grading, curbs, gutters and sidewalks, public utilities, public water facilities including fire hydrants, public sanitary sewer systems, storm sewer system and/or other drainage improvements.

Structural Controls
Any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution

Suspended Sediment Concentration (SSC)
The measure of the concentration of suspended solid material in a water sample by measuring the dry weight of all of the solid material from a known volume of a collected water sample. Results are reported in mg/L.

Total Suspended Solids (TSS)
The measure of the suspended solids in a water sample includes inorganic substances, such as soil particles and organic substances, such as algae, aquatic plant/animal waste, particles related to industrial/sewage waste, etc. The TSS test measures the concentration of suspended solids in water by measuring the dry weight of a solid material contained in a known volume of a sub-sample of a collected water sample. Results are reported in mg/L.

Toxicity
The adverse response(s) of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies.

Turbidity
The cloudiness of water quantified by the degree to which light traveling through a water column is scattered by the suspended organic and inorganic particles it contains. The turbidity test is reported in Nephelometric Turbidity Units (NTU) or Jackson Turbidity Units (JTU).

Vertical Construction Phase
The Build out of structures from foundations to roofing, including rough landscaping.

Waters of the United States
Generally refers to surface waters, as defined by the federal Environmental Protection Agency in 40 C.F.R. § 122.2.[1]

Water Quality Objectives (WQO)
Water quality objectives are defined in the California Water Code as limits or levels of water quality constituents or characteristics, which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

[1] The application of the definition of "waters of the United States" may be difficult to determine; there are currently several judicial decisions that create some confusion. If a landowner is unsure whether the discharge must be covered by this General Permit, the landowner may wish to seek legal advice.

APPENDIX 6:
Acronym List

ASBS	Areas of Special Biological Significance
ASTM	American Society of Testing and Materials; Standard Test Method for Particle-Size Analysis of Soils
ATS	Active Treatment System
BASMAA	Bay Area Storm water Management Agencies Association
BAT	Best Available Technology Economically Achievable
BCT	Best Conventional Pollutant Control Technology
BMP	Best Management Practices
BOD	Biochemical Oxygen Demand
BPJ	Best Professional Judgment
CAFO	Confined Animal Feeding Operation
CCR	California Code of Regulations
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CGP	NPDES General Permit for Storm Water Discharges Associated with Construction Activities
CIWQS	California Integrated Water Quality System
CKD	Cement Kiln Dust
COC	Chain of Custody
CPESC	Certified Professional in Erosion and Sediment Control

SECTION 3
Comment Letters

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works Bureau of Engineering (BOE) and Bureau of Sanitation (LASAN), and Department of Recreation and Parks (RAP), are collectively referred to herein as the "City." LADWP acting as Lead Agency circulated the Draft Initial Study/Mitigated Negative Declaration (Draft IS/MND) for the Stormwater Capture Parks Program (Program) for public review for 30 days (January 7, 2021 through February 7, 2021) in accordance with the requirements of the California Environmental Quality Act (CEQA) Guidelines Section 15072(a). BOE, LASAN, and RAP will act as Responsible Agencies. The City received a total of eight comment letters during the public review period, which are listed in **Table 3-1** and are included within this chapter. The letters have been marked with brackets that delineate comments pertaining to environmental issues and the information and analysis contained in the Draft IS/MND. Responses to such comments are provided in Section 4.

TABLE 3-1
COMMENT LETTERS RECEIVED

Comment Letter No.	Commenter	Date of Comment
1	California Department of Transportation	January 13, 2021
2	Luis Suarez	January 15, 2021
3	Marie Gordon	January 22, 2021
4	Brenda Dalusong	February 2, 2021
5	California Department of Fish and Wildlife	February 5, 2021
6	Diana Nicole, Sunshine Hills Residents Association	February 8, 2021
7	County of Los Angeles Fire Department	February 9, 2021
8	Joanne D'Antonio	February 8, 2021

SECTION 4
Response to Comments

4.1 Comments on the Draft IS/MND and Response to Comments

The responses to comments included in this section correspond to each comment letter outlined in Section 3.

Letter 1: Miya Edmonson (California Department of Transportation)

Comment 1-A

The commenter summarizes the project description.

Response 1-A

The comment is noted and will be included in the project record.

Comment 1-B

The commenter states that an encroachment permit would likely be required for any project work, including road closures, done on or near California Department of Transportation's (Caltrans) right of way.

Response 1-B

As noted on page 33 of the Draft IS/MND, the City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities. In addition, Caltrans is an active partner in the Program, providing some funding and assisting with project level designs.

Comment 1-C

The commenter states that a Caltrans transportation permit is required for transporting any heavy construction equipment and/or materials with oversized-transport vehicles on State Highways.

Response 1-C

The City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities.

Comment 1-D

The commenter recommends that project construction traffic is limited to off-peak periods to minimize potential impacts on State facilities.

Response 1-D

As outlined in Mitigation Measure TR-1, the City and/or its contractors will coordinate with Los Angeles Department of Transportation (LADOT) in order to prepare a construction traffic management plan (CTMP) for the Program which will include time of day restrictions, and time limitations for construction traffic.

Comment 1-E

The commenter requests submission of a construction traffic management plan to Caltrans for review if State facilities are expected to have delays. The commenter request that the traffic management plan includes details on any traffic delays that would occur on State facilities during construction, and alternate bicycle and pedestrian routes for any routes that would be affected during construction.

Response 1-E

The City will submit the CTMP to Caltrans for review if delays are expected on State facilities.

Comment 1-F

The commenter expresses support for Transportation Demand Management (TDM) strategies which the City has incorporated into the Program and recommends additional options to further reduce Vehicle Miles Traveled (VMT) and greenhouse gas emissions impacts.

Response 1-F

The Draft IS/MND concluded that Program impacts to VMT and greenhouse gas emissions would occur at levels that are below CEQA significance thresholds, without implementation of any mitigation measures.

Letter 2: Luis Suarez

Comment 2-A

The commenter requests more information regarding the environmental impacts that would occur on homes surrounding Fernangeles Park.

Response 2-A

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules and that Program impacts remain below the specific impact thresholds identified in Appendix G of the

CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 2-B

The commenter expresses concern regarding the potential for groundwater saturation in surrounding neighborhoods as a result of the proposed infiltration galleries at Fernangeles Park.

Response 2-B

The Program would include construction of underground infiltration galleries, which would capture surface flow and divert stormwater runoff from the Caltrans pump discharge to recharge the San Fernando Groundwater Basin. The infiltration galleries will be constructed of concrete and are designed to retain flows for percolation into the San Fernando Groundwater Basin. The ground surface surrounding the park would be restored to support recreational uses similar to current conditions. The Draft IS/MND evaluates the potential for groundwater mounding to occur that could affect surface infrastructure. A technical analysis prepared by Todd Groundwater Consultants is included as Appendix E. As noted in Table 1 of Appendix E, the infiltration galleries would range from 16 to 29 feet below ground surface and the groundwater levels in the area range from 105 to 335 feet below the ground surface. Mitigation measure GEO-1 has been included to monitor groundwater levels and reduce flow diversions when groundwater is within 50 feet of the surface. With mitigation implemented, the Draft IS/MND concludes that the potential for elevated groundwater levels would be minimized.

Letter 3: Marie Gordon

Comment 3-A

The commenter requests information regarding start and end dates for Program construction activities that would occur near two senior citizen apartment buildings located along Vanowen Street, between Whitsett Avenue and Rhodes Avenue, just south of Whitsett Fields Park North.

Response 3-A

As noted in Table 1-6 on page 40 of the Draft IS/MND, construction activities at Whitsett Fields Park North are expected to take approximately 18 months, starting in June 2025 and ending in November 2026. Construction at Valley Plaza Park North, located east of I-170 on Vanowen Street, is expected to take approximately 17 months, starting in November 2023 and ending in March 2025. Construction work hours would generally be restricted to times between 7 A.M. and 7 P.M., Monday through Friday.

Comment 3-B

The commenter expresses concern regarding construction mitigation measures and their potential to minimize environmental impacts on senior citizens living in nearby apartments. The commenter states that the environmental impacts of prior projects were not effectively mitigated.

Response 3-B

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules, and that Program impact levels remain below the specific thresholds identified in Appendix G of the CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 3-C

Commenter states that the Notice of Intent (NOI) for the Program is dated January 7, 2021 but was not received until January 20, 2021.

Response 3-C

The comment is noted and will be included in the project record. The public review period for the Draft IS/MND was from January 7, 2021, to February 7, 2021. The commenter received the NOI within the public review period of the Draft IS/MND in compliance with CEQA.

Letter 4: Brenda Dalusong

Comment 4-A

The commenter requests that the City consider construction of sidewalks around the perimeter of Fernangeles Park as part of the Program's proposed recreational facilities enhancements. The commenter states concern for pedestrian/motor vehicle safety around the park due to the lack of sidewalks available for pedestrian use.

Response 4-A

Figures 1-4 through 1-12 provide architectural drawings for each of the proposed parks that include public access and pedestrian circulation to support existing recreational uses.

Letter 5: Erinn Wilson-Olgin (California Department of Fish and Wildlife)

Comment 5-A

The comment acknowledges that California Department of Fish and Wildlife (CDFW) received the Draft IS/MND for review and to provide comments.

Response 5-A

Comment noted.

Comment 5-B

CDFW disagrees with the City's impact analysis, which finds that the Project's diversion of water would not impact biological resources

The Project would divert dry season flow and stormwater totaling 3,010 acre-feet per year (AFY). The water would otherwise proceed downstream via concrete channels to the Los Angeles River. The Draft IS/MND concluded that "no beneficial uses would be impacted." However, flow reduction could have a significant impact on downstream biological resources, especially during the dry season proceeding after a below-average water year.

Response 5-B

The Draft IS/MND on pages 74 and 77 describes that the Program would reduce dry season flows from the Tujunga Central Branch channel that would reduce water in the Los Angeles River. In response to the comment the sentence on page 77 of the Draft IS/MND has been revised as follows:

> The Los Angeles River currently discharges an average of over 100 cubic feet per second (cfs) to the ocean during dry weather (City of Los Angeles 2018). The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent of total annual flow or approximately 4 percent of dry weather flow), and as a result no beneficial uses, including biological resources, would be significantly impacted.

As noted in the comment, the reduction of dry weather flows is itself an impact. Therefore, the changes to the text provided above as requested in the comment are appropriate. The Draft IS/MND identifies the reduced flow impact on page 74, but concludes that no riparian or aquatic habitat would be removed or adversely affected within the downstream reaches of the Los Angeles River. Therefore, since no habitat would be lost or stressed, the flow reduction would be a less than significant impact. The analysis relies on a de minimis impact conclusion. That is, the reduction of 1.4 percent of total flow and approximately 4 percent of dry weather flow in the river would not result in loss of habitat or result in reduced habitat quality. Rather, diverting dry-weather urban runoff would benefit water quality. The Draft IS/MND describes on pages 74 and 77 how beneficial uses are well supported by the remaining dry season flows. This evidence is outlined further below.

The Draft IS/MND describes in Section 1.5 that six of the nine Program sites (see table below) would require insertion of diversion structures within underground storm drain pipes. No habitat values exist within the buried storm drain pipes. The remaining four Program sites would require installation of diversion structures within existing Tujunga Central Branch concrete box channel or reinforced concrete box culvert. The watershed drained by this Tujunga Central Branch

channel is a small portion of the San Fernando Valley adjacent to but outside of the Tujunga Wash drainage area, representing 1.7 percent of the total Los Angeles River watershed.

Infiltration Gallery Location	Diversion Structure Installation
David M. Gonzales Recreation Center	Underground Storm Drain Pipe
FernAngeles Park	Underground Storm Drain Pipe
Whitsett Fields Park North	Underground Storm Drain Pipe
Strathern Park North	Underground Storm Drain Pipe
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert
Valley Plaza Park South	Concrete Channel
Alexandria Park	Concrete Channel
North Hollywood Park	Concrete Channel
Valley Village Park	Underground Storm Drain Pipe

The Draft IS/MND describes on page 74 that the Tujunga Central Branch channel is concrete-lined with no ecological value. As a result, direct impacts to habitat values from installing diversion structures would not adversely affect biological resources. Furthermore, the Draft IS/MND concludes on pages 74 and 77 that the proposed diversions would result in a small reduction of the flow in the Los Angeles River compared to the current flow, including in the dry season, and would not result in measurable effects to biological resources. The Draft IS/MND references the hydrological analysis conducted by the City for the One Water LA Program and cites that currently an average of 100 cubic feet per second (cfs) reaches the ocean in the concrete channel of the Los Angeles River during dry weather (City of Los Angeles 2018). The Program diversions represent an annual average flow of approximately 4 cfs or 4 percent of the dry weather flows to the ocean. The Draft IS/MND concludes on page 77 that the reduction caused by the project would represent 1.4 percent of the total flow in the river on an annual average. Since the river discharges substantial flow to the ocean in the dry season (>100 cfs), the Draft IS/MND concludes that the proposed project's 1.4 percent diversion of total flows and 4 percent of dry season flows would not result in significant impacts to biological resources.

The Draft IS/MND also concludes on page 153 that the flow reductions would not result in a cumulatively significant reduction, including in the dry season. This conclusion is consistent with the One Water LA Study, which provides an overview of stormwater flows in Chapter 3and the Los Angeles River in Chapter 4. (City of Los Angeles 2018).

In addition to the published One Water LA study, the City has been participating in the Los Angeles River Flows Project, a comprehensive new hydrologic study of the river led by the Southern California Coastal Watershed Research Project (SCCWRP) in partnership with the State Water Resources Control Board (SWRCB). This new study is called the Los Angeles River Flows Project and is sponsored by the City of Los Angeles (by and through LADWP and LASAN), Los Angeles Regional Water Quality Control Board (LARWQCB), and the Los Angeles County Sanitation Districts (LACSD). SCCWRP is a quasi-public agency established to

support Southern California governmental agencies with third-party, science-based analysis. The Los Angeles River Flows Project was initiated in 2019 expressly to evaluate potential effects of cumulative flow reductions in the Los Angeles River, including reductions in WRP discharges and future stormwater capture projects such as the proposed Project. CDFW has been actively participating in the Project as a member of the Technical Advisory Committee (TAC).

In May 2021, SCCWRP published a report titled Process and Decision Support Tools for Evaluating Flow Management Targets to Support Aquatic Life and Recreational Beneficial Uses of the Los Angeles River as part of the Los Angeles River Flows Project (LA River Flows Project Final Report) (SCCWRP, 2021b). This new Final report, included by reference with this Final IS/MND, characterizes the environmental attributes of the river channel and evaluates flows that support those attributes, providing flow-ecology relationships helpful in understanding dry season flow reduction impacts on ecological values. The report develops a set of tools to evaluate future flow management scenarios. One of the three objectives noted in the report is to:

> "Produce tools and approaches to help evaluate how potential modified flow regimes in the LA River may affect the likelihood of supporting aquatic life and recreational beneficial uses" (SCCWRP, 2021b)

The results of this study directly confirm the conclusions outlined in the IS/MND, including an evaluation of the effects to focal species of reduced storm flows during the dry season. See response to comment 5-I for more discussion on the new study and the conclusions regarding impacts to ecological values from reduced dry weather flow.

Comment 5-C

The Draft IS/MND does not provide sufficient analysis of the Project's potential biological impacts to allow CDFW to determine the Project's significance or need for mitigation.

Data Source: The Draft IS/MND uses data from the 2015 *Los Angeles River Ecosystem Restoration Integrated Feasibility Report* (USACE 2015). The U.S. Army Corp of Engineers (USACE) report analyzes the feasibility of restoring an 11-mile stretch of the Los Angeles River from Pollywog Park to Downtown Los Angeles, referred to in the report as the ARBOR reach (Area with Restoration Benefits and Opportunities for Revitalization) (USACE 2015). Citing the USACE report, page 77 of the Draft IS/MND states, "USACE estimated that existing water sources provide 211,348 AFY of flow within the Los Angeles River watershed on an annual basis. The proposed diversion would be approximately 1.4 percent of the existing water source […]. The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent), and no beneficial uses would be impacted.

The Draft IS/MND may have underestimated the percentage of water diverted from the Los Angeles River in using 211,348 AFY as the basis for deriving 1.4 percent. After factoring in water demand (e.g., infiltration, evaporation, evapotranspiration), the USACE estimated that flow would be reduced from 211,348 AFY to 143,793 AFY annually and 29,166 AFY in the summer

(April through September) (USACE 2015). Based on reduced volumes, the Project's proposed diversion would be approximately 2.2 percent annually, an increase from 1.4 percent. During the summer, diversion would be approximately 10.3 percent. Based on the above, the Draft IS/MND's impact analysis may not have accurately estimated the proportion of water the Project would divert from the Los Angeles River.

Response 5-C

The calculation in the comment asserting a 10.3 percent reduction is inaccurate in that it assumes the entire diversion estimate of the proposed Program (3,010 AFY) will occur between April and September. It would be more appropriate when calculating the six-month dry season percentage from the 29,166 AFY flow assumption to compare half the annual anticipated diversion, which would be 1,505 AFY, calculated as 5.14 percent of the total dry season flow. A different way of calculating the contribution of flows attributed to the Tujunga Central Branch channel is to compare the project's diversion estimates with flow estimates at the ocean. The One Water LA Report (City of Los Angeles 2018) estimates that the river discharges 100 cfs to the ocean during summer months. The Program's proposed diversion of 3,010 AFY would constitute approximately 4 percent of the existing flow to the ocean during the summer months. This would be a conservative assumption since it does not attribute any stormwater capture to the proposed Program. The Draft IS/MND concludes that the contribution of flow to the Los Angeles River from the Tujunga Central Branch channel during the dry season is small (1.4 percent of the total volume and 4 percent of dry weather flow) compared to other sources. Furthermore, the watershed represents only 1.7 percent of the total watershed feeding stormwater to the Los Angeles River. Based on these flow estimates, the Draft IS/MND concludes that the proposed project would not significantly affect the ecology of the river.

The City, including LADWP, is participating in the Los Angeles River Flows Project in partnership with the SWRCB, and in close coordination with CDFW. The Los Angeles River Flows Project has been initiated by SWRCB to better understand the water demands of beneficial uses in the river, and to support future flow management priorities with science-based demand characterizations. See response to comment 5-I for more discussion on the new study.

Comment 5-D

Seasonality: The Draft IS/MND does not thoroughly analyze the potential significance of water diversion depending on the season. During the dry season, typically April through September in southern California, the Los Angeles River is largely maintained by urban runoff and discharge from WRPs. Diverting water could be significant during the dry season and could either significantly reduce water flow or result in complete loss of water flow from the Tujunga Central Branch channel to the Los Angeles River.

Response 5-D

The Draft IS/MND does evaluate the seasonality of the potential effects of the Program on page 74. The assessment describes the effects of the proposed Program on both dry weather flows and

wet weather flows. The Draft IS/MND notes on pages 74 and 77 that dry weather flows would be reduced slightly but would not result in loss of habitat. This is substantiated by the fact that 100 cfs currently discharges to the ocean in dry weather indicating a surplus of flow. Furthermore, the Draft IS/MND also points out that the ecological values of the river would be enhanced with the reduction of pollutant daily loads conveyed in dry weather flow. The water quality benefits of stormwater capture on downstream habitat values are described further in One Water LA, Chapter 4 Los Angeles River Study (City of Los Angeles 2018), as a fundamental benefit of the City's Program, and supports the water quality objectives of the regional Municipal Separate Storm Sewer System (MS4) stormwater NPDES permit of which the City is a participating permittee. See response to comments 5-C and 5-G.

Comment 5-E

Drought: The Draft IS/MND does not analyze the potential significance of water diversion during a below-normal water year. Since 2000, the longest duration of drought in California lasted between 2011 and 2019 (USGS 2021) and in southern California, between 2012 through 2016 (Los Angeles Almanac 2021). The 2017-2018 rainfall season was below normal and the driest for Los Angeles since 2006-2007 (Los Angeles Almanac 2021). Diverting water during a below normal rainfall year may significantly reduce water flow or result in complete loss of water flow.

Response 5-E

Annual rainfall amounts vary in the Los Angeles River watershed, with multi-year droughts likely becoming more common. The City's Stormwater Capture Master Plan states that "although the average annual precipitation in downtown Los Angeles is 15.3 inches, it ranges from a low of 4.69 inches (2007) to a high of 30.6 (1998). The mountains that surround the coastal plain, and are tributary to the City, experience considerably more rainfall than downtown Los Angeles. For example, in Big Tujunga Canyon, annual rainfall ranged from 9.62 inches in 1989 to 53.93 in 1998." (LADWP Stormwater Capture Master Plan, 2015; p. 3) The watershed represents only 1.7 percent of the total LA River watershed. The reduction would not significantly reduce dry season flows. The comment does not provide any additional information not already considered in the Draft IS/MND. See response to comment 5-I.

Comment 5-F

Beneficial Uses: The concrete lined portions of the Los Angeles River support wildlife. These portions of the Los Angeles River are regionally significant, especially in a dense urban environment with substantial loss or alteration of the natural hydrologic regime and river ecosystems. A reduction of flow, especially dry season flow, could directly or indirectly impact biological resources through habitat modifications. Where the Los Angeles River overtops the concrete-lined channel, the resulting sheet flows allow phytoplankton (algae and cyanobacteria), microorganisms, and herbaceous vegetation to establish. The algae provide habitat and a food source for benthic invertebrates, a vital food source for wading birds. The Los Angeles River provides habitat for hundreds of bird species, making these areas birding hotspots. The least Bell's vireo (*Vireo bellii pusillus*), an Endangered Species Act and CESA-listed endangered

species, has been documented within the Glendale Narrows area. Least Bell's vireo depends on willow (*Salix* genus) riparian habitat. The ARBOR reach examined in the USACE report contains soft-bottom channels that support herbaceous and woody vegetation. Dominant species include black willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and arroyo willow (*Salix laevigata*) (USACE 2015). The middle reach of the Los Angeles River, specifically Glendale Narrows, supports anadromous fish that includes the Pacific lamprey (*Entosphenus tridentatus*), a California Species of Special Concern.

The Draft IS/MND concludes that "no beneficial uses would be impacted." The Draft IS/MND does not offer a quantitative analysis as to how it determined no impacts would occur. Moreover, the Draft IS/MND does not define what it considered to be "beneficial uses." Diverting water during the dry season could reduce the availability and extent of shallow water sheet flow downstream. This could potentially impact algae, benthic invertebrates, and birds. Willow riparian habitat may be impacted if reduction in flow leads to receding shoreline or lower water depth. Preliminary work of the Los Angeles River Flows Project show that black willow (*Salix gooddingii*) seedling mortality increases as water depth decreases (SWRCB 2019). Loss of suitable habitat may impact sensitive species such as least Bell's vireo. Anadromous fish have specific habitat requirements including water depth, velocity, and vegetation.

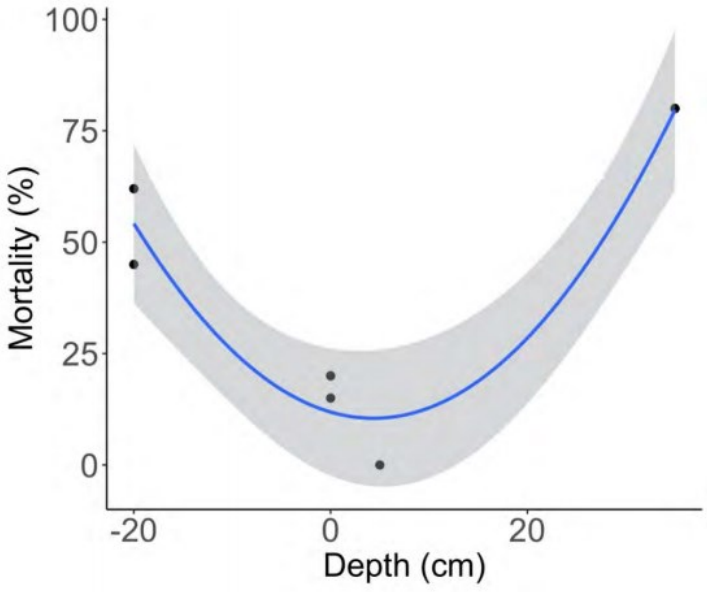
Response 5-F

The Draft IS/MND on pages 74-78 describes the valuable biological resources existing in the Los Angeles River that are supported by consistent surface flow. The Draft IS/MND cites the One Water LA Program to substantiate the values found in the river, including all the species described in the comment. The 4 percent reduction of the current 100 cfs in the lower river channel would not reduce habitat from sheet flow in the lower reaches of the river since the flows would continue to be greater than the low flow channel and would continue to overflow and maintain the sheetflow condition. Phytoplankton and herbaceous vegetation would continue to provide a food source for benthic invertebrates, and for wading birds, as noted in the comment. The Draft IS/MND does provide a quantitative assessment of the potential effect of the proposed Program by estimating a 1.4 percent flow reduction. This small average flow reduction would not result in measurable effects to habitat values in the concrete-lined Los Angeles River either in the Arbor Reach or in the concrete-lined portion of the lower river. Furthermore, the Draft IS/MND cites the One Water LA Study that states that far more water exits the Arbor Reach under current conditions than is proposed to be diverted by the proposed Program. That is to say, since more water exits the system than is contributed by stormwater, there would be sufficient quantity of flow to meet the existing ecological demand. The Draft IS/MND concludes that the calculated flow reductions would not impact beneficial uses.

The comment cites information from a report published for the Los Angeles River Flows Project in January 2021 that provides a habitat suitability assessment for species known to occur in the Los Angeles River. The citation notes that black willow seedling mortality increases with water depth reduction. This information is extracted from a life stage suitability curve provided in the report. The Assessment Report does not provide a conclusion on the optimal water flow depth in

the Los Angeles River. Rather, the Habitat Assessment Report (SCCWRP 2021a) provides suitability curves that show a relationship with water depth and different life cycle stages for various species.

The figure below taken from that report shows that willow seedling mortality is more complex than stated in the comment: mortality is at a minimum at mean depths of around 5 cm and then increases with both reductions and increases in flow depth. In other words, germination occurs within a specific range of flow depth.



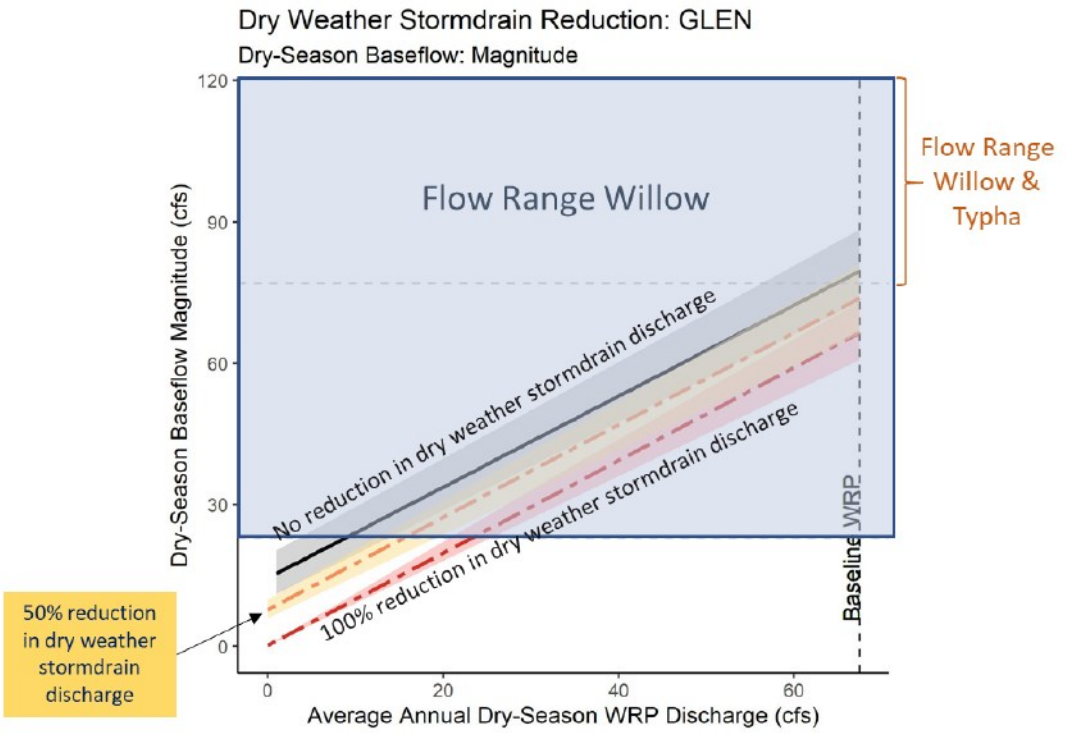


Figure 35. Habitat suitability curve of seedling mortality as a function of inundation/depth from water surface of Salix Gooddingii calculated through quadratic linear regression. Depth is defined as depth from surface i.e., -20 cm = 20 cm below surface, 20 cm = 20 cm above surface. Mean = 5 cm, p = 0.002, n=5.

The second figure, taken from the recently published SCCWRP flow study (SCCWRP 2021b) shows that willow in the Glendale Narrows area of the Los Angeles River can sustain a wide range of flow conditions. The graph shown below from the study shows that WRP discharges could be reduced by 80 percent and still support the existing willow. The WRP flow reduction of 80 percent illustrated, from 75 cfs to 15 cfs, is an order of magnitude greater than the proposed flow reduction from the proposed Program. The graph also shows that if all urban baseflows were captured, WRP discharges could be reduced by up to 68 percent and the existing willow habitat would be maintained. That is to say, a 100 percent reduction in urban baseflow across the Los Angeles River watershed (of which the proposed Program watershed comprises 1.7 percent by area) would still allow for a 68 percent reduction in WRP flow and continue to support willow habitat. This substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.

The effect of stormwater diversion would reduce Los Angeles River flows less than 4 cfs in the dry season, compared to the current dry season average of 75 cfs in the Arbor Reach and 100 cfs where the Los Angeles River confluences with the Pacific Ocean. The remaining flow would provide for the needs of willow and other riparian vegetation. The conclusions illustrated in the SCCWRP study for black willow show that surface water depth is not a driving factor in the suitability of black willow habitat in the Los Angeles River. The comment does not identify any other citation supporting water needs for the riparian habitats See response to comment 5-I.

Comment 5-G

Cumulative Flow Reductions: The Draft IS/MND does not analyze whether the Program would result in significant impacts when considered with other existing or proposed water diversion projects in the Los Angeles River watershed. The cities of Burbank, Glendale, and Los Angeles plan to recycle more wastewater and reduce their discharges to the Los Angeles River for this purpose (SWRCB 2019).

Response 5-G

The Draft IS/MND concludes on page 153 that the proposed Program would not result in cumulatively significant effects to the environment. This conclusion is based on the quantitative analysis that 4 percent of dry weather flow (1.4 percent of total annual flow) is too small an amount to result in an appreciable, or measurable change in the habitat values currently exhibited in the Los Angeles River. Furthermore, the City has acknowledged that cumulative flow reductions in the future may include potential reductions in WRP discharges to support regional

recycled water program objectives. To evaluate the effects of cumulative reductions in future flows that may include future diversions of WRP discharges, the SWRCB has conducted the Los Angeles River Flows Project. The study published by SCCWRP through the Los Angeles River Flows Project (SCCWRP 2021b) provides tools to all the river stakeholders to best manage the resource's beneficial uses. Future projects that may propose further diversions in dry weather flow may rely on this study to assess potential direct and cumulative effects of WRP discharge diversions. These future WRP diversions will be subject to Water Code Section 1211 Petitions, approved by the SWRCB.

In January 2021, SCCWRP published a report titled the Assessment of Aquatic Life Use Needs for the Los Angeles River Report (Assessment of Aquatic Life Report) (SCCWRP 2021a). This report characterizes habitat values in the river, and evaluates water demands of riparian and aquatic species known to occur in the river system. Habitat suitability curves have been developed for certain focal species based on the assessment. Habitat suitability curves were developed as part of a technical tool to assist the SWRCB in assessing potential WRP flow reductions in the Los Angeles River, but are not themselves flow recommendations.

The Assessment of Aquatic Life Report outlines habitat suitability criteria for three species: black willow, cattails (*Typha sp*.), and algae (*Cladophora sp*.). The study provides an overview of the cumulative effects of stormwater diversions to the overall flow in the Los Angeles River. The graphic provided in response to comment 5-F above summarizing the relationship between flow in the river and ecological water demands of willow substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.

The City, including LADWP, is committed to maintaining a supportive role in the Los Angeles River Flows Project. See response to comment 5-I.

Comment 5-H

Diverting water from the Los Angeles River may impact biological resources downstream, especially during the dry season proceeding after a below-average water year. Impacts to any sensitive or special status species should be considered significant under CEQA unless they are clearly mitigated below a level of significance. Inadequate avoidance, minimization, and mitigation measures for impacts to sensitive or special status species will result in the Project continuing to have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species by CDFW or U.S. Fish and Wildlife Service.

Response 5-H

See responses to comments 5-G and 5-I.

Comment 5-I

Mitigation Measure #1: CDFW recommends LADWP provide additional analysis and evaluation of potential impacts on biological resources as part of the final environmental document. At a minimum, an additional analysis and report should provide the following:

Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Changes to Hydrology and Hydraulics

1. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

2. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

3. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

4. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Biological Resources Impact Assessment

5. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

6. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad

search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

a. A summary of species-specific habitat requirements;

b. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

c. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

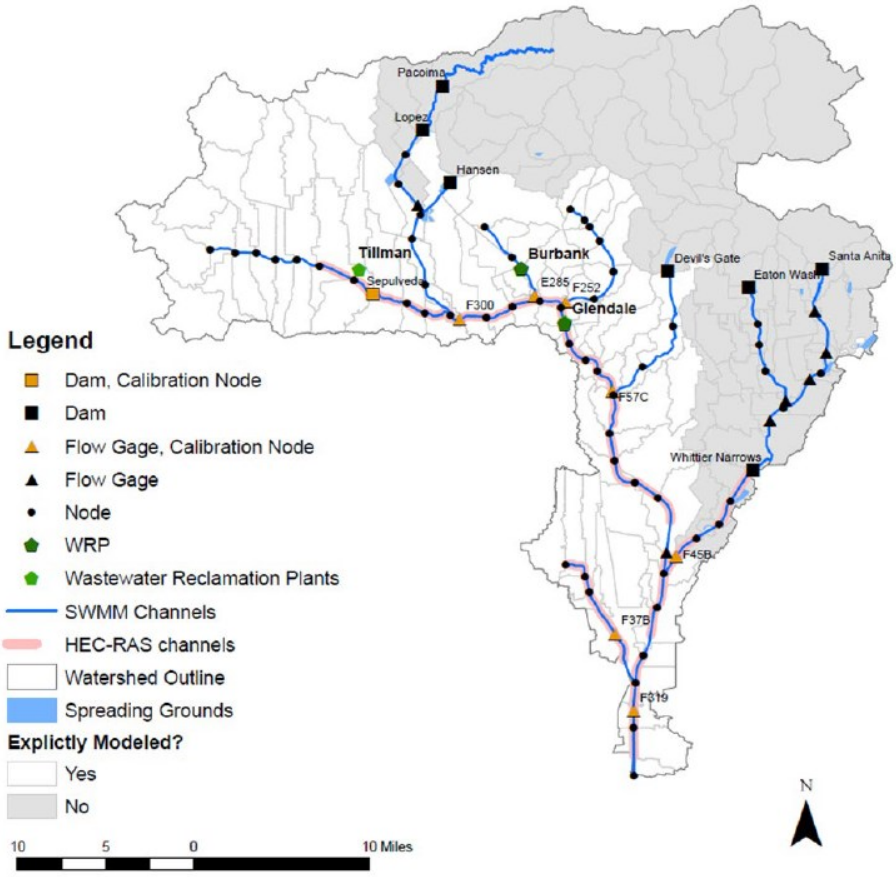
7. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

8. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

9. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response 5-I

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel, and that it would be unreasonable to assume otherwise. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required. However, in response to the comment and request for mitigation, the Los Angeles River Flows Project Final report (LA River Flows Project Final Report), published after the Draft IS/MND was published is incorporated by reference into this Final IS/MND. This robust hydrological, hydraulic, and ecological study of the Los Angeles River conducted by SCCWRP for SWRCB is designed to develop a set of tools and approaches to help evaluate future flow management scenarios. The Project applies the California Environmental Flow Framework (CEFF) approach to evaluating ecological flow relationships in California streams. The City is participating in the Los Angeles River Flows Project to assess how future flow diversions from WRPs may be best managed to support beneficial uses and management priorities in the river.



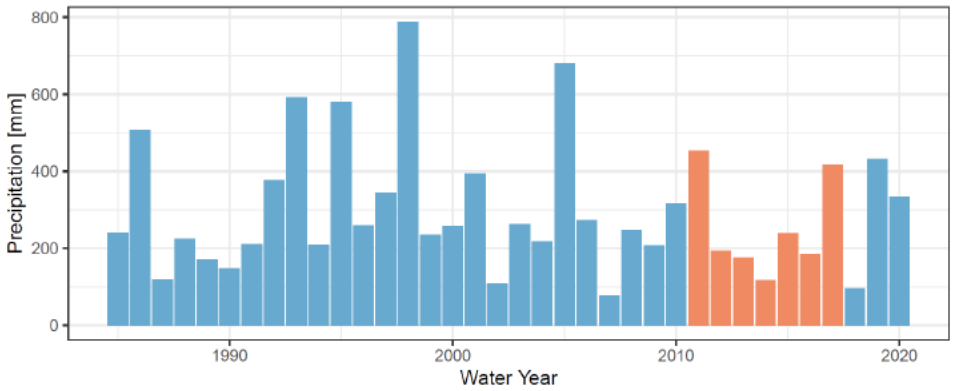
The LA River Flows Project Final Report is presented in this Final IS/MND to respond to this detailed comment. The Report was conducted over a two-year period, including input from numerous stakeholders including both LADWP and CDFW. The Report assists in evaluating the potential significance of the impacts of stormwater capture projects, such as the proposed Project, and includes all of the elements proposed in the comment and recommended mitigation measure. The following responses address each point in the comment:

Comment 5-Ia: Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Response to Comment 5-Ia

With respect to the Study Reach, the Los Angeles River Flows Project includes assessments of habitat values in the entire Los Angeles River from the Sepulveda Dam to the Pacific Ocean. This study area is larger than requested in the comment. The model domain included as Figure 5 in the study is included below. The Tujunga Central Branch channel confluences with the Los Angeles River at approximately node F300 shown in in the figure.



Comment 5-Ib: Hydrology and Hydraulics

2. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

Response to Comment 5-Ib

With respect to Changes to Hydrology and Hydraulics, the Los Angeles River Flows Project includes results from a comprehensive modelling effort that meets all the parameters in the comment. As noted on pages 7 through 9 of the study, estimated flow conditions were modeled using a coupled hydrologic-hydraulic model created in EPA's Storm Water Management Model (SWMM) and the Hydrology Engineering Center's River Analysis System (HEC-RAS). The hydrologic model simulates discharge on the mainstem of the LA River, Compton Creek, and Rio Hondo at an hourly time step from WY 2011 through 2017. The model includes wet season and dry season discharges and uses a dry period to represent conservative flow estimates as shown in the figure below taken from Figure 3 of the study.

The one-dimensional hydraulic model was created by combining existing HEC-RAS models for the LA River and updating channel geometry and Manning's roughness based on field observations and calibration. The hydraulic model was run under steady-state conditions, which were used to develop rating curves to apply to the simulated hydrographs, producing time series hydraulic data for velocity, maximum channel depth, and shear stress.

Some excerpts from the SCCWRP 2021 report that describes the Flows Project are included here:

> *"We estimated current flow condition in the study area using a coupled hydrologic-hydraulic model created in EPA SWMM and HEC-RAS (ES-2). Current hydrologic conditions are defined as the flows and operations that occurred during water year (WY) 2011 to 2017." (SCCWRP, 2021; p ii)*

"Calculated ranges for the wet season and dry season baseflow metrics increase downstream of the three water reclamation plants, illustrating the contributions of discharges from the water reclamation plants…. The wet season metrics, baseflows from the start of the storm season to the start of the dry season, and dry season metrics, base flows from the start of the dry season to the start of the following wet season, are calculated on an annual basis. Typically, the start of the wet season is between November to January and the start of the dry season is between May to July depending on the climatic conditions for a given water year. The broader ranges and higher values of wet season baseflow metrics reflects the contribution of residual stormdrain discharge following storm events. Rio Hondo and Compton Creek both have the lowest wet season and dry season baseflow magnitudes compared to all other reporting nodes on the mainstem." (SCCWRP, 2021; p iv.)

Comment 5-Ic: Hydrology and Hydraulics

3. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

Response to Comment 5-Ic

As noted Figure ES-5 of the LA River Flows Project Final Report and excerpted below, dry weather storm flow contributions are a key consideration in the study. The graph illustrates average baseline flows with the black line accompanied by a grey band that indicates the 10 percent and 90 percent percentiles. This grey shading following the black line accounts for extremely dry years. In other words, the analysis represented by this graph takes dry year and wet year flows into consideration.

The graph compares potential future combined flow reductions of both dry weather runoff and WRP reductions with habitat value impacts. The large grey box represents habitat suitability for black willow habitat. The graph shows that a small percentage decline in dry weather storm channel flows (even in very dry years) would not reduce flows in the river below suitability thresholds for willow habitat, resulting in no reductions in habitat acreage or habitat quality. (The flow range for typha [cattails] is also included in the graph to show flow requirements for typha across the entire channel width. The flow rate is needed due to the wide channel width. Less flow could support typha within a narrower side channel such as shown in the HEC-RAS cross section provided in response to comment 5-!d below)As a result, the impact would be less than significant from a direct, indirect and cumulative perspective.

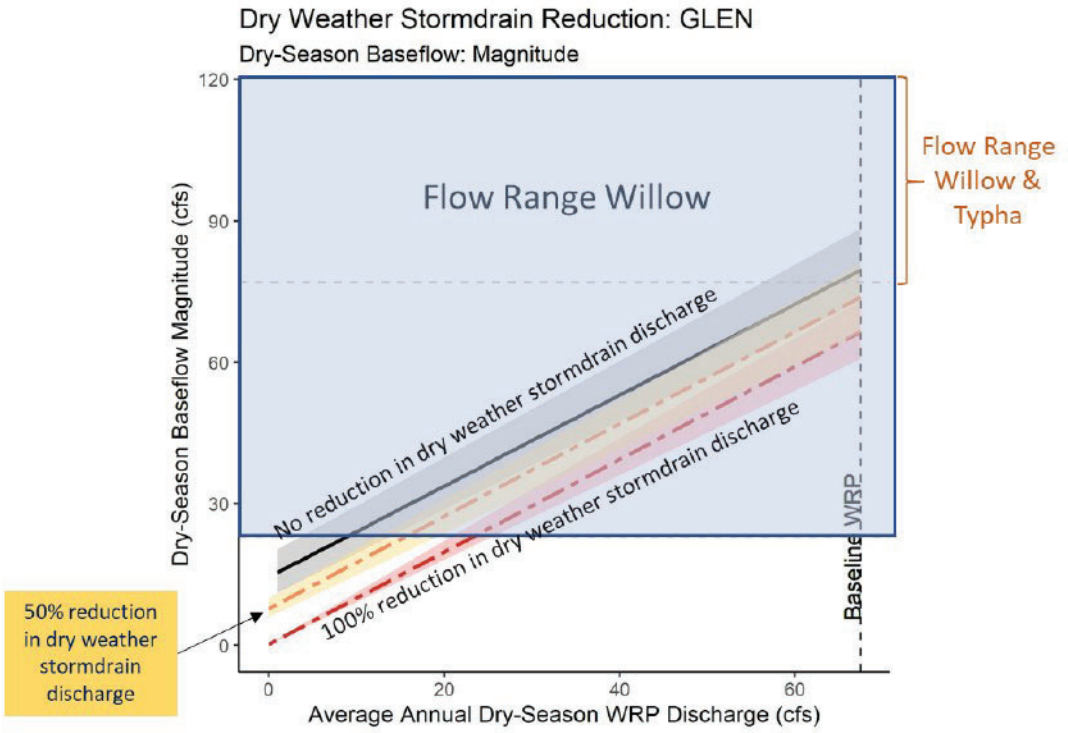


Figure ES-5. Flow-based sensitivity curves illustrating the combined effects of change in WRP discharge and 50% (yellow) and 100% reduction (red) in dry weather stormdrain discharge at GLEN reporting node. Solid and dashed lines represent median values; bounds of the gray and colored bands are the 10th and 90th percentile dry-season instream flows across the modeled period. Optimal flow range in this example is based on a 50% (medium) probability of occurrence of Willow and Typha.

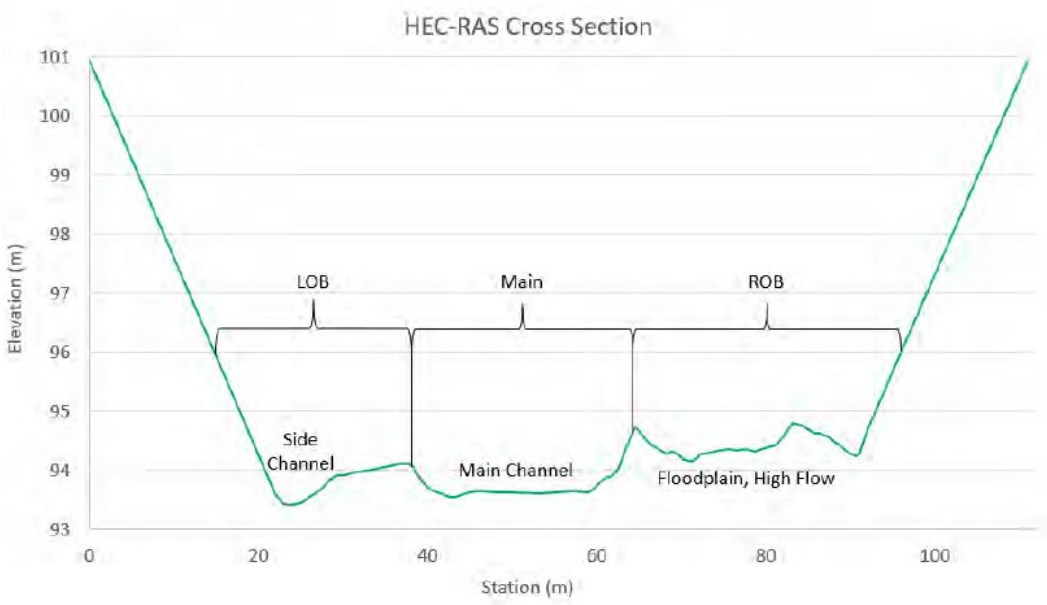
Comment 5-Id: Hydrology and Hydraulics



4. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

Response to Comment 5-Id

The Los Angeles River Flows Project published the "Assessment of Aquatic Life Use Needs for the Los Angeles River" (Assessment of Aquatic Life Report) in February 2021 (Stein, 2021). This document provides a detailed summary of hydraulic HEC-RAS modeling done to support the overall program objectives. Over 1,000 cross sections were generated by the HEC-RAS model in the river that show impacts of flow reductions to depth and wetted perimeter (as requested in the comment). Since the roughness of the Los Angeles river changes over time and greatly influences depth and wetted perimeter in specific locations, the model characterized typical channel dimensions and roughnesses to provide meaningful ecological-flow relationships. An excerpt from page 15 of this study is included below:

"Channel hydraulics (i.e., maximum channel depth, velocity, and shear stress) can vastly differ across different sections of the channel at a single site. For every soft-bottom output node in the HEC-RAS model, three output locations were selected at the three most significant morphological zones to capture the variability in hydraulics for each node and were designated as left overbank (LOB), center channel (Main), and right overbank (ROB)"

The figure below provided on page 15 of the Assessment of Aquatic Life Report shows how channel characteristics were accommodated in the ecological-flow relationship analysis provided in the report. Habitat suitability curves were developed to reflect water depth and velocity requirements of existing habitat within these three different parts of the channel: side channel, main channel, and high floodplain. Although the Assessment of Aquatic Life Report does not provide a map of the habitat within the Los Angeles River associated with each of these cross sections, it does inventory the species and habitat values that occur within the soft-bottom portion of the river (the 15-mile segment highlighted in the comment) and presents a detailed HEC-RAS model that provides depth and width impacts associated with flow reductions at specific cross section locations that were also measured in the field for model calibration purposes. The evaluation of habitat suitability within this segment of the river (see graph provided in response to comment 5-F) is then expressed in cubic feet per second (cfs) impacts rather than depth and width in order to provide a meaningful model for the total 15 miles of the soft-bottom segment.

Comment 5-Ie: Hydrology and Hydraulics

5. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Response to Comment 5-Ie

As described in responses above, the Assessment of Aquatic Life Report as well as the LA River Flows Project Final Report provide a comprehensive assessment of flow in the Los Angeles River including each of the flow sources noted in the comment. The Assessment of Aquatic Life Report describes average dry season river flows in each segment of the river accounting for contributions from WRPs, groundwater, and storm drain channel inputs.

Comment 5-If: Biological Resources Impact Assessment

1. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

Response to Comment 5-If

The Assessment of Aquatic Life Report provides an inventory of habitat and species occurrences within the 15-mile segment mentioned in the comment. Figure 34 of the Assessment of Aquatic Life Report reproduced below illustrates which reaches exhibit aquatic and riparian habitat values. Habitat mapping was not conducted as part of the study. Rather, flow ranges supporting habitat suitability for all aquatic values were developed, assuming that the entire 15-mile river segment may exhibit habitat values.

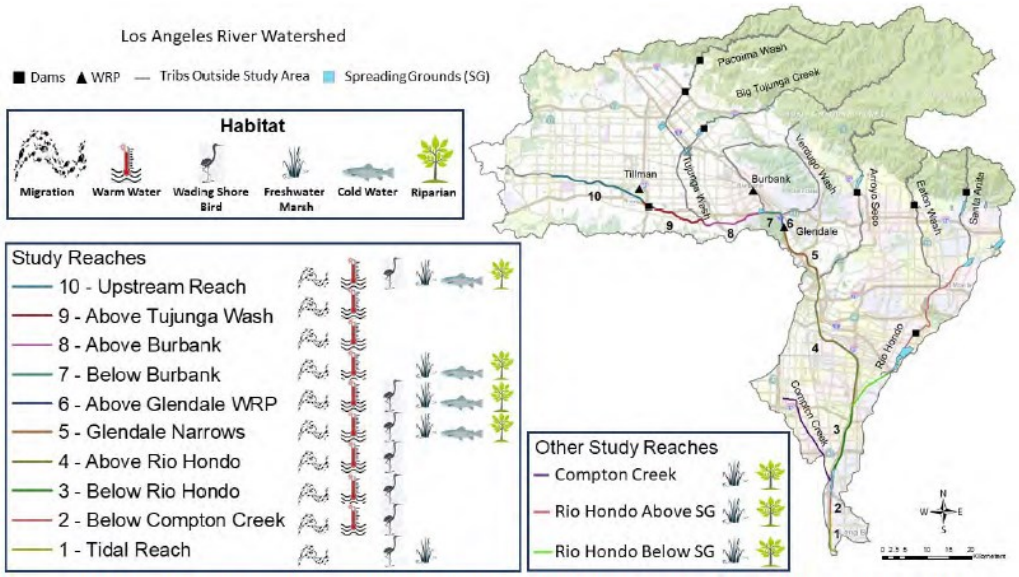


Figure 34. Map of study reaches with identified habitats that could potentially be supported in each reach.

Comment 5-Ig: Biological Resources Impact Assessment

2. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

    d. A summary of species-specific habitat requirements;

    e. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

    f. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

Response to Comment 5-Ig

The Los Angeles River Flows Project Final Report includes a comprehensive inventory and assessment of biological habitat values in the Los Angeles River:

> *"The overarching goal of this project is to consider potential effects of reduced WRP discharge and increased stormwater capture on existing and potential future beneficial uses. Therefore, our analysis included characterizing species and habitats that current occur and those that could reasonably occur in the future (based on a comparison to similar southern California watersheds). "(SCCWRP, 2021; p vii)*
>
> *"The aquatic life use assessment began with a compilation of observational data from the LA River and surrounding watersheds which was used to identify priority focal habitats and endmember species that represent a range of tolerances for each habitat. We then determined the flow conditions necessary to support the life history needs of each species and used those to create "flow-ecology" curves or models relating key hydrologic, hydraulic, and temperature conditions to the probability of occurrence for each focal species, or the probably of being able to complete specific life-history requirements." (SCCWRP, 2021; p vii)*

The Assessment of Aquatic Life Report provides the CNDDB listed species of concern in a concise map excerpted below. Beginning on page 38, the Assessment of Aquatic Life Report provides a summary of "life history needs" for key species within the habitat types. Habitat suitability curves are prepared based on the target vegetation's needs for water as measured by flow in the river (ie., cfs). This analysis defines future water flow reductions as the impact, and provides suitability curves to evaluate significance of the impact. The graph included in response to comment 5-F summarizes the relationship of flow in the river with habitat suitability for willow habitat. Since willow habitat (the key indicator species for riparian values in Southern California) is sustained with substantially less flow than currently exists or is projected to exist with future flow reductions, the contribution of 4 percent flow reduction resulting from the proposed project is considered cumulatively less than significant. That is to say, the scientific analysis contained in the LA Rivers Flows Project Final Report and companion study Assessment of Aquatic Life Report provide the information requested in this comment and support the conclusions of the IS/MND.

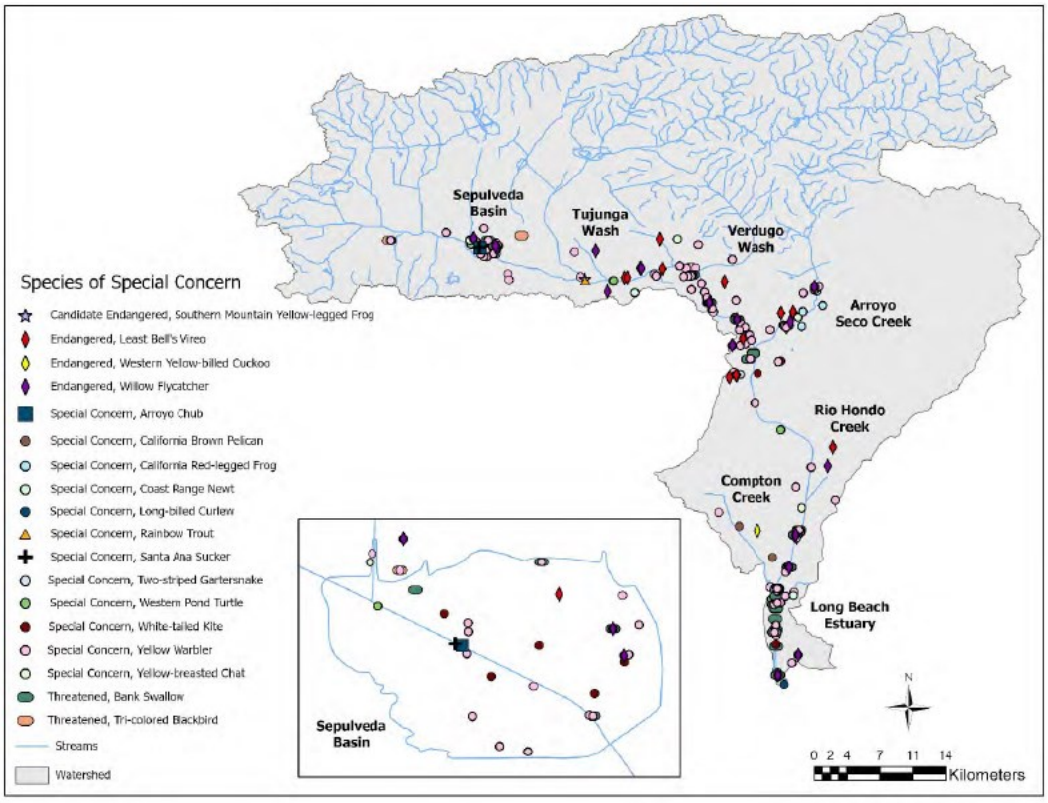

Figure 33. Species observations along the mainstem of the LA River and tributaries included in this study.

Comment 5-Ii: Biological Resources Impact Assessment

3. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

Response to Comment 5-Ii

As described on page 74 of the IS/MND, the proposed diversion structures would not impact any biological resources since they would be installed within either underground storm drain pipes or concrete box channels. The only effect to biological resources that could occur would result from reduced flow to downstream resources. No habitat would be removed as a result of the Project. As described in detail in this response to comment 5-I those effects are determined to be less than significant.

Comment 5-Ij: Biological Resources Impact Assessment

4. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

Response to Comment 5-Ij

As described in this response to comment 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. No restoration projects are currently occurring within the river channel that would be adversely affected by the proposed Project.

Comment 5-Ik: Biological Resources Impact Assessment

5. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response to Comment 5-Ik

As described in responses to comments 5-F and 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. The LA Flows Project Final Report provides ecology-flow relationship analysis for cumulative reductions including incremental storm flow and WRP reductions. The Project would not contribute to a cumulative reduction in habitat acreage or quality.

Comment 5-J

Mitigation Measure #2: CDFW recommends LADWP develop a discharge operation plan that would always allow sufficient water to pass downstream. CDFW also recommends LADWP develop an Adaptive Management Plan that would direct LADWP to reduce or suspend water diversion if at any point the Project may impact biological resources downstream exceeding a defined threshold/trigger.

Response 5-J

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. Downstream ecological values would not be measurably affected by the Project. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

LADWP recognizes that the placement of diversion structures within streams and drainages must comply with Fish and Game Code Section 5901 which prohibits installing "any device or contrivance that prevents, impedes, or tends to prevent or impede, the passing of fish up and down stream." Fish and Game Code 5937 requires that operators of dams "allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam." Currently, no fish exist within the underground urban storm collection system or concrete box channel. The Tujunga Central Branch channel does not lead to natural stream resources at higher elevation. As a result, the channel would not provide a migratory route for steelhead spawning grounds now or in the future. The entire watershed area is urbanized, mostly within underground storm drain pipes with no ecological values. Future fish migration in the channel is highly unlikely. Furthermore, the instream diversion structures have been designed and operated to allow for storm flows to bypass the diversion mechanism. Each of the diversion structures would include a slide gate. If fish re-colonized the channel in the future these slide gates would be able to allow bypass flows. Therefore, based on the ability to allow for storm flows, the diversion structures would also be able to accommodate fish passage during periods of receding flow when migration opportunities exist, if fish were present. The project would not prevent future habitat restoration or fish occupation in the drainage. The proposed designs would

be compliant with California Fish and Game Code 5901 and 5937. Since no fish are currently in the concrete channel and dry weather flow depths do not accommodate ponding sufficient for fish to survive, there is no reason to prepare a discharge operation plan or adaptive management plan at this time.

See responses to comments 5-G and 5-I.

Comment 5-K

Mitigation Measure #3: CDFW recommends LADWP provide compensatory mitigation at no less than 3:1 for permanent impacts to the concrete-lined Tujunga Central Branch channel due to the installation of diversion structures including (but not limited to) rubber dams and channel drop inlets. CDFW also recommends LADWP provide compensatory mitigation commensurate with the permanent diversion of discharge from Los Angeles River.

Response 5-K

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

The purpose of compensatory mitigation for impacts to waters of the State is to ensure that habitat values and hydrologic functions are maintained at least at the level of the system prior to the initiation of the project. The current concrete channel into which the diversion structures will be placed currently provides no habitat value. Six of the diversion structures will be placed in underground reinforced concrete pipe. The City does not believe that compensation is required for placing diversion structures in underground concrete pipes or concrete channels. As noted on page 74 of the Draft IS/MND, the City will be required to obtain a Lake and Streambed Alteration Agreement (LSAA) from CDFW for the three park projects that will place diversion structures within concrete channels. See response to comment 5-N.

Comment 5-L

Recommendation #1: CDFW recommends the following data and information sources:

- Stream gage data available from Los Angeles County Public Works (LADPW 2021);
- Los Angeles River Master Plan (Geosyntec et al. 2020); and,
- Los Angeles River Flows Project (SWRCB 2019).

Response 5-L

The IS/MND (on page 74) includes annual flow estimates for the Los Angeles River provided by USACE. The data provided in the Draft IS/MND regarding flows is consistent with the river flow data provided in the references cited in the comment. The City is participating in the Los

Angeles River Flows Project which has compiled hydrologic and hydraulic data for the river. The data mentioned in the comment from the County are continuously collected and are indicative of the flow data used by the USACE to ensure flood protection for the City of Los Angeles. The recently published Los Angeles River Master Plan compiles historic river flow data consistent with the USACE and County data. All of this data is consistent with the annual flow totals cited in the IS/MND that document the percentage of flow from the Tujunga Central Branch channel. See response to comments 5-C and 5-G.

Comment 5-M

Recommendation #2: Based on the inadequacy of the Draft IS/MND as elaborated in our preceding comments, CDFW recommends that LADWP revise and recirculate the Draft IS/MND so CDFW may provide more appropriate comments on avoidance, minimization, and mitigation measures (CEQA Guidelines, § 15073.5).

Response 5-M

The comment provides no new information supporting the inadequacy of the analysis in the Draft IS/MND. Re-circulation of the Draft IS/MND is not necessary since existing evidence supports a conclusion that impacts would be less than significant, and that it would be unreasonable to assume otherwise. Furthermore, the study recently published by SCCWRP (SCCWRP 2021b) provides all of the hydrology and hydraulics data and analysis requested in the comment. The study substantiates the conclusions made in the Draft IS/MND, and satisfies CDFW's request for additional information.

Comment 5-N

The Project would potentially alter streams. The Project would divert dry season flow and stormwater. In addition, the Project proposes to install devices within and adjacent to a stream to facilitate water diversion.

The Project would divert water from the Tujunga Central Branch channel and Los Angeles River. The Project proposes to install water diversion structures within or adjacent to the Tujunga Central Branch channel. This includes inflatable rubber dams. Accordingly, the Project may obstruct water flow and change the bed and channel of a stream (confinement).

Fish and Game Code section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake;
- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or,
- Deposit or dispose of material into any river, stream, or lake.

Response 5-N

The Draft IS/MND states on page 74 that the City would be required to obtain a Streambed Alteration Agreement pursuant to the California Fish and Game Code section 1602. The City will consult with CDFW to obtain a 1602 LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel. Installation of diversion structures into underground storm drain pipes may require notification, but would not likely result in the need for a full LSAA. The table below identifies LADWP's assumptions of which Program sites may require a LSAA LADWP understands that CDFW will ultimately determine which of these sites will require a LSAA based on information in the initial notification.

Infiltration Gallery Location	Diversion Structure Installation	LSAA Required?
David M. Gonzales Recreation Center	Underground Storm Drain Pipe	No
FernAngeles Park	Underground Storm Drain Pipe	No
Whitsett Fields Park North	Underground Storm Drain Pipe	No
Strathern Park North	Underground Storm Drain Pipe	No
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert	No
Valley Plaza Park South	Concrete Channel	Yes
Alexandria Park	Concrete Channel	Yes
North Hollywood Park	Concrete Channel	Yes
Valley Village Park	Underground Storm Drain Pipe	No

Comment 5-O

Mitigation Measure #1: CDFW has concluded that the [Program] may result in the alteration of streams. As such, the applicant (or "entity") must provide notification to CDFW pursuant to Fish and Game Code, section 1600 *et seq*. Based on this notification and other information, CDFW determines whether an LSAA with the applicant is required prior to conducting the proposed activities. Please visit CDFW's Lake and Streambed Alteration Program webpage to for information about LSAA Notification and online submittal through the Environmental Permit Information Management System Permitting Portal (CDFW 2021a).

Response 5-O

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602. A new mitigation measure requiring compliance with regulations is not needed. The City will consult with CDFW to obtain a 1602 LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel (see table in response 5-N).

Comment 5-P

Mitigation Measure #2: CDFW recommends the LSAA Notification include a hydrological evaluation of the 200, 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions.

Recommendation: CDFW's issuance of an LSAA for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from LADWP for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 *et seq*. and/or under CEQA, the CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSAA. As such, CDFW recommends LADWP consider CDFW's comments and revise the Draft IS/MND. To compensate for any on- and off-site impacts to aquatic and riparian resources, additional mitigation conditioned in any LSAA may include the following: erosion and pollution control measures, avoidance of resources, protective measures for downstream resources, on and/or off-site habitat creation, enhancement or restoration, and/or protection, and management of mitigation lands in perpetuity.

Response 5-P

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602(See response to comment 5-N). Hydrologic assessments have been conducted for each of these park projects to determine the capacity of the infiltration galleries and the quantity of feasible wet weather diversions. The rubber dam diversion structures would be lowered when flow rates exceeded the diversion capacity, allowing most of the storm flows in larger storms (including the 2, 5, 10, 25, 50, 100, and 200 year storms) to bypass the diversions. Additional modeling is not necessary to make this conclusion.

Comment 5-Q

CDFW is concerned that the Program may result in significant impacts to bats, including hoary bat (*Lasiurus cinereus*) and silver haired bat (*Lasionycteris Octavian's*).

The Program may result in direct and indirect impacts to bats. Direct impacts include removal of trees and that may provide roosting habitat. Indirect impacts to bats and roosts could result from increased human activity, noise disturbances, dust, vegetation clearing, ground-disturbing activities (e.g., staging, mobilizing, excavating, and grading), and vibrations caused by heavy equipment.

Native and non-native ornamental trees at each park could provide potential roosting habitat for bats. Bats can fit into very small seams, as small as a ¼ inch. Therefore, crevices in buildings and other man-made structures within and adjacent to each park could provide roosting habitat for bats. Despite the availability of potential roosting habitat, the Program concludes that there would not be significant impacts to bats.

Page 60 of Appendix B concludes that while bats "may use western sycamore trees to roost, special-status bat species including hoary bat and silver-haired bat have low potential to occur within all of the project locations, since they are situated in an urban environment with constant ambient nighttime lighting (e.g., street lights, baseball field lights)." The presence of constant ambient lighting may be insufficient to conclude that bats do not occur. Bat response to artificial lighting could vary between species and not all bat species are repelled by light (Longcore and Rich 2004; Opéra et al. 2009). Faster-flying species of bats are attracted to insects that congregate around light sources (Longcore and Rich 2004). Foraging is still possible in the presence of ambient lighting, although forging may be reduced. Also, based on Program site photos in Appendix B, it appears that not all areas within certain parks are illuminated, for instance Valley Plaza North and Valley Plaza South. Based on the above, the probability of bats occurring within each park could be higher than previously concluded.

Accordingly, if bats are present, extra noise, vibration, or the reconfiguration of large objects can lead to the disturbance of roosting bats. Human disturbance can also lead to a change in humidity, temperatures, or the approach to a roost that could force the animals to change their mode of egress and/or ingress to a roost. Modifications to roost sites can have significant impacts on the bats' usability of the roost and can impact the bats' fitness and survivability (Johnston et al. 2004). Although temporary, such disturbances can lead to the abandonment of a maternity roost (Johnston et al. 2004).

Response 5-Q

The Draft IS/MND identifies on page 73 that removal of trees may affect wildlife commonly found in the parks, including bat species, although the Draft IS/MND concludes that the potential for encountering bat roosts in the affected trees is low. Nonetheless, in response to this comment, Mitigation Measure BIO-1 has been modified to require that bat surveys be conducted at each of the Program sites to ascertain whether bats are utilizing the trees to be removed by the Program. With this modification to the BIO-1 mitigation measure, impacts to bats would remain less than significant.

The following text is added to Mitigation Measure BIO-1:

- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

Comment 5-R

Bats are considered non-game mammals and are afforded protection by State law from take and/or harassment (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). Additionally, several bat species are considered Species of Special Concern and meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Take of SSC could require a mandatory finding of significance by the Lead Agency (CEQA Guidelines, § 15065).

Response 5-R

See response to comment 5-Q.

Comment 5-S

Mitigation Measure #1: Where Program-related implementation, construction, and activities would occur near potential roosting habitat for bats, CDFW recommends a qualified bat specialist conduct bat surveys within these areas (plus a 100-foot buffer as access allows) in order to identify potential habitat that could provide daytime and/or nighttime roost sites, and any maternity roosts. CDFW recommends using acoustic recognition technology to maximize detection of bats. A discussion of survey results, including negative findings should be provided to LADWP. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the LADWP prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.

Response 5-S

Mitigation Measure BIO-1 has been modified to accommodate CDFW suggested mitigation requirements. See response to comment 5-Q.

Comment 5-T

Mitigation Measure #2: If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed down using heavy machinery rather than felling with a chainsaw. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. The tree should then be pushed to the ground slowly and remain in place until it is inspected by a bat specialist. Trees that are known to be bat roosts should not be bucked or mulched immediately. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape.

Response 5-T

Mitigation Measure BIO-1 provides for bat surveys to confirm that bats are not using the trees. If bats are encountered the City will consult with CDFW to ensure an effective bat removal effort in compliance with the California Fish and Game Code. Bats will not be removed from the Program sites without prior CDFW approval. No additional tree removal techniques would be required. No new mitigation is required.

Comment 5-U

Mitigation Measure #3: If maternity roosts are found, to the extent feasible, work should be scheduled between October 1 and February 28, outside of the maternity roosting season when young bats are present but are yet ready to fly out of the roost (March 1 to September 30).

Response 5-U

Mitigation measure BIO-1 has been modified to require approval from CDFW if bats are found to be using the affected trees. As part of any bat removal effort that may be necessary, seasonality of the removal will be a consideration. No additional mitigation measure is required.

Comment 5-V

Mitigation Measure #4: If maternity roosts are found and LADWP determines that impacts are unavoidable, a qualified bat specialist should conduct a preconstruction survey to identify those trees proposed for disturbance that could provide hibernacula or nursery colony roosting habitat. Acoustic recognition technology should be used to maximize the detection of bats. Each tree identified as potentially supporting an active maternity roost should be closely inspected by the bat specialist no more than 7 days prior to tree disturbance to determine the presence or absence of roost bats more precisely. If maternity roosts are detected, trees determined to be maternity roosts should be left in place until the end of the maternity season. Work should not occur within 100 feet of or directly under or adjacent to an active roost. Work should also not occur between 30 minutes before subset and 30 minutes after sunrise.

Response 5-V

As noted in response to comment 5-Q, mitigation measure BIO-1 has been modified to include bat presence surveys. If bats are found, the mitigation measure would require that the City implement a bat removal program in consultation with CDFW.

Comment 5-W

Devices Impeding Fish. The Program includes installation of rubber dams in the stream channel. Per California Fish and Game Code section 5901, it is unlawful to construct or maintain in any stream any device or contrivance the prevents, impedes, or tends to prevent or impeded, the passing of fish up and downstream. Accordingly, LADWP should coordinate with CDFW prior to commencing the Program to ensure that the Program would comply with Fish and Game Code section 5901.

Response 5-W

The concrete pipeline and channel do not support fish species. The Program would not install any devices that would impede fish migration since fish do not occur in the concrete channel and underground pipeline associated with the Tujunga Central Branch channel. The primary impediment for migrating fish under existing conditions is the velocity of the fast-moving storm water in confined pipelines and channels and the lack of refugia habitat at the channel edges. Nonetheless, the in-channel devices for four of the Program sites will require an LSAA from CDFW. The City will consult with CDFW to ensure diversion structures are compliant with Fish and Game Code section 5901.

Comment 5-X

Southern California Black Walnut Tree (*Juglans californica*). According to page 73 in the Draft IS/MND, one Southern California black walnut tree may be removed at North Hollywood Park. Southern California black walnut is a California Rare Plant Rank 4.2 species. If removal of Southern California black walnut is required, CDFW recommends LADWP replace each tree at no less than 3:1 in consideration of the species rarity, temporal loss of black walnut tree canopy and structure while the tree grows, and potential attrition associated with transplanting. Southern California black walnut trees should be replaced with trees of the same species.

Response 5-X

As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced with 24-inch box size specimens of the same tree species at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy.

Comment 5-Y

Tree Replacement. In the greater Los Angeles, urban forests and street trees, both native and some non-native species, provide habitat for a high diversity of birds (Wood and Esaian 2020). Some species of raptors have adapted to and exploited urban areas for breeding and nesting (Cooper et al. 2020). For example, raptors (Accipitridae, Falconidae) such as red-tailed hawks (*Buteo jamaicensis*) and Cooper's hawks (*Accipiter cooperii*) can nest successfully in urban sites. Red-tailed hawks commonly nest in ornamental vegetation such as eucalyptus (Cooper et al. 2020). CDFW recommends planting native tree species preferred by birds. This includes coast live oak (*Quercus agrifolia*) and California sycamore (*Platanus racemosa*) (Wood and Esaian 2020). CDFW recommends Audubon Society's Plants for Birds for more information (Audubon Society 2020).

Response 5-Y

The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced

with 24-inch box size specimens at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings. Mitigation Measure BIO-1 is included in the Draft IS/MND to ensure construction activities do not disturb nesting birds. The requirement to replace mature trees would encourage future nesting opportunities for raptors.

Comment 5-Z

Landscaping. CDFW strongly recommends avoiding non-native, invasive plants. CDFW recommends LADWP restrict use of any species, particularly 'Moderate' or 'High' listed by the California Invasive Plant Council (Cal-IPC 2020a). CDFW recommends LADWP use native species found in naturally occurring vegetation communities within or adjacent to the Program sites. Information on alternatives for invasive, non-native, or landscaping plants may be found on the California Invasive Plant Council's, Don't Plant a Pest webpage for southern California (CalIPC 2020b). The California Native Plant Society's Gardening and Xerces Society's PollinatorFriendly Native Plant Lists webpage has information on native plant species that invite insects and pollinators (CNPS 2020; Xerces Society 2020).

Response 5-Z

As noted in the project description, each of the Program sites will be re-landscaped following the installation of the stormwater capture infrastructure. The landscaping plans will use primarily native species to the extent feasible, per RAP landscaping guidelines.

Comment 5-AA

Move Out of Harm's Way. The proposed Program is anticipated to result in clearing of habitats that support wildlife species common in developed areas. CDFW recommends a qualified biological monitor be on site during initial ground disturbing activities and vegetation removal. The qualified biological monitor should move wildlife of low mobility out of harm's way to avoid wildlife injury or mortality.

Response 5-AA

Mitigation Measure BIO-1 would ensure that impacts to any avian species currently utilizing the Program sites would be avoided. As required in mitigation measure BIO-1, contractors will be encouraged to remove vegetation outside of the affected avian or bat nesting seasons. If nesting season cannot be avoided, the mitigation measure provides for measures to ensure impacts to nesting birds is avoided, including delaying activities if necessary. Since the Program sites do not support any native habitat values, a biological monitor is not recommended other than for nesting birds as required in mitigation measure BIO-1.

Comment 5-AB

Data. CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database (i.e., California Natural Diversity Database) which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDB Field Survey Forms (CDFW 2020b). LADWP should ensure the data has been properly submitted, with all data fields applicable filled out, prior to finalizing/adopting the environmental document. LADWP should provide CDFW with confirmation of data submittal.

Response 5-AB

The City acknowledges that survey data identifying special status species should be provided to the CDFW. Appendix B of the Draft IS/MND includes a Biological Technical Report prepared for the Program.

Comment 5-AC

Mitigation and Monitoring Reporting Plan. CDFW recommends LADWP update the Program's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist LADWP in developing mitigation measures that are specific, detailed (i.e., responsible party, timing, specific actions, location), and clear in order for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). LADWP is welcome to coordinate with CDFW to further review and refine the Program's mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided LADWP with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).

Response 5-AC

The City will adopt the MMRP when approving the Final IS/MND that will include implementation of Mitigation Measure BIO-1.

Comment 5-AD

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by LADWP and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

Response 5-AD

The City recognizes that the CDFW filing fee for this IS/MND is applicable and the appropriate funds will be included with the Notice of Determination (NOD) when filed with the County Clerk as required by the CEQA Guidelines Section 15094.

Comment 5-AE

The comment includes a table with all of the CDFW proposed Mitigation Measures outlined in the letter.

Response 5-AE

As discussed in the responses to comments 5-A through 5-AE, no new mitigation measures are needed to ensure less than significant effects to biological resources. The MMRP will include the modified Mitigation Measure BIO-1 that reflects CDFW's comments on bat species.

Letter 6: Diana Nicole (Sunshine Hills Residents Association)

Comment 6-A

The commenter expresses concern regarding the diversion of City plans, codes, and funds from parks and tree-oriented initiatives toward green infrastructure.

Response 6-A

The comment does not state a specific concern about the adequacy of the Draft IS/MND or otherwise comment on the contents of the Draft IS/MND analysis. The comment is noted and will be included in the Program record, but a response is not required pursuant to CEQA.

Comment 6-B

The commenter expresses concern regarding the depletion of existing trees/urban forest resources as a result of the Program.

Response 6-B

Once the stormwater capture infiltration galleries are installed, the Program sites will be returned to preconstruction condition with park improvements. The park improvements will include but are not limited to, the addition of green infrastructure elements such as landscape areas with California native drought-tolerant plant material, new irrigation system, shade trees, new lighting. The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. Any protected tree required to be removed would be replaced with 24-inch box trees at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings.

Comment 6-C

The commenter states that the City's protected trees, groves, and related habitat should be subject to higher conservation standards than those that are provided in the Draft IS/MND.

Response 6-C

The City would comply with the existing tree ordinance. See response to 6-B above.

Letter 7: County of Los Angeles Fire Department

Comment 7-A

The commenter provides introduction of the County of Los Angeles Fire Department.

Response 7-A

The comment is noted and will be included in the Program record.

Comment 7-B

The commenter states that since the Program is within the City, the Program would not impact the County of Los Angeles Fire Department.

Response 7-B

The comment is noted and will be included in the Program record.

Comment 7-C

The commenter states that the Program would not have an impact on the County Fire Department Land Development Unit.

Response 7-C

The comment is noted and will be included in the Program record.

Comment 7-D

The comment states that under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the Oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured 4 1/2 feet above mean natural grade.

Response 7-D

The Draft IS/MND describes the Oak Tree Ordinance in detail on pages 78-81. The Draft IS/MND concludes that compliance with the ordinance and RAP's Tree Preservation Policy would ensure that impacts to mature trees would not result in significant impacts.

Comment 7-E

The commenter states that the Program would not impact the Health Hazardous Materials Division.

Response 7-E

The comment is noted and will be included in the project record.

Letter 8: Joanne D'Antonio

Comment 8-A

The commenter raises objection to the proposed removal of any mature and healthy trees, most notably the eucalyptus grove at North Hollywood Park. The commenter states that this park has experienced great tree loss during the drought and that all parks are important for the physical and psychological health of residents. They provide much needed shade in the heat-island-effect-plagued San Fernando Valley. The commenters asks where the wildlife will go during construction and how disruptive construction noise may be.

Commenter would like to see the project redesigned to not remove any trees and references several reports on biodiversity and the loss of trees and tree canopy by the City of Los Angeles and Tree People.

Response 8-A

All nine project sites are currently located within developed City parks containing active recreational facilities or open disturbed areas. All nine park project sites will undergo some enhancements and improvements to the park aesthetic and recreational facilities after the installation of the projects. As stated in the IS/MND page 7, park enhancements and improvements are being designed with input from RAP and the community. The City has been coordinating the design effort with RAP and has engaged the local community through several community meetings to solicit input. Conceptual design drawings were included in the IS/MND as Figures 1-4 through 1-12 to depict the current preliminary design associated with each park project site. The stormwater capture facilities are mainly being placed beneath existing ball fields, where feasible, to minimize impacts to landscaped areas within the park. The designs for each park attempt to minimize tree removal where feasible, but as stated in section 2.4, Biological Resources, some trees will be removed in compliance with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees. The City has been in coordination with the RAP Forestry Division and none of the parks' mature or healthy trees will be removed without their approval. Revisions to the park designs are being made in coordination with RAP in order to preserve mature trees and any other trees deemed sacred by RAP. RAP has identified two eucalyptus trees at North Hollywood Park that have died and have requested these be removed as part of the project. Tree surveys will be conducted at each part project site prior to tree removal to determine which trees are protected and which trees would need replacement under the RAP Tree Preservation Policy. Further, Mitigation Measure BIO-1was included to protect wildlife species from impacts during

construction. This mitigation measure will require construction activities to occur outside of the nesting bird season or to avoid or minimize impacts to nesting birds and raptors by requiring preconstruction surveys and nest avoidance and/or monitoring during construction.

The City acknowledges that the City of Los Angeles is considered a biodiversity hotspot. As stated in the 2020 Biodiversity Report prepared by the City of Los Angeles and referenced by the commenter, the Program area would fall primarily within Ecotope 20: Los Angeles River Alluvial Plain. As shown in Appendix B, page 428 of the report, only 0.5 percent of the natural vegetation remains across the ecotope, mostly within the Sepulveda Basin. Riparian vegetation is the dominant remaining type of vegetation and provides nesting habitat for the federally endangered least Bell's vireo (*Vireo bellii pusillus*) and potentially the southwestern willow flycatcher (*Empidonax traillii extimus*). The Program site does not include riparian vegetation and is located in an area that is surrounded by a vegetation alliance characterized by urban/developed, and falls mostly within areas characterized by non-native alliances. In addition, the program site is not located within an area characterized as a natural area by the study, and it is located within areas with higher pollution and population percentiles and a lower habitat quality score due to the urban nature of its location. (City of Los Angeles 2020, pages 436 through 442) As such, although the City of Los Angeles is rich in biodiversity, construction within the Program area would not add to the decline of biodiversity in the area.

Comment 8-B

The commenter requests that all trees in the vicinity of construction be protected with orange fencing and no construction material placed under the drip line.

Response 8-B

The construction impact areas will be clearly delineated and trees to be retained will be clearly marked to avoid any impacts to them. As stated in Response 8-A, the City will comply with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees that are being retained onsite and/or are being removed.

The RAP Tree Preservation Policy is the primary regulatory tool that gives direction for orderly protection of specified trees, maintains their value, and avoids significant negative effects to the ecosystem. By assuring preservation and protection through regulation and standards of care, these resources will remain significant contributions to the environment and landscape, and continue to add to the unique character of Los Angeles City Parks. (RAP 2004).

As outlined in the Policies for the Installation and Preservation of Landscaping Trees on Public Property of Recreation and Parks Department, included as Appendix M of the City of Los Angeles RAP Urban Forest Program (RAP 2004), "whenever trees are removed, the existing trees' aggregate diameter, measured at breast height (DBH [diameter at breast height], or 4.5-feet above the ground; multi-trunk trees are to be measured immediately below the lowest trunk) shall be replaced at an equal or greater rate of caliper of new trees. Each one-inch DBH of existing tree shall be replaced with a minimum one-inch caliper new tree." For example, if an existing tree with a DBH of 24 inches is removed, the City would need to replace that tree with a newly

planted trees with a total DBH of 24 inches. The replacement tree can have a DBH of 24 inches or if smaller trees are planted, with a DBH of 2 inches, then 12 trees would be planted, or any combination that equates to the 24-inch DBH being replaced.

Comment 8-C

The commenter is concerned about imported soil and improper soil being substituted for naturally occurring soil which create the best environment for replanting. The commenter asks if there is a plan for replanting at the parks to be done with viable new trees. The commenter states that ideally construction projects such as these would not be happening in our parks.

Response 8-C

As stated on page 38 of the IS/MND, once installation of the stormwater system is complete, soils excavated from the site that are stockpiled on-site would be used to backfill the impact areas. Additional imported soils would be used to regrade as needed to return the project impact areas to pre-project conditions. The City will ensure that the soil to backfill the impacted areas would be suitable for the required design elements as shown on preliminary Figures 1-4 through 1-12 of the IS/MND including landscape planting. The City is coordinating with RAP to ensure compliance with park requirements.

Comment 8-D

The commenter states that a one-month comment period is too short to get input from neighborhood councils.

Response 8-D

The comment is noted and will be included in the project record. The CEQA Guidelines require that MNDs be circulated for a total of 30 days per Section 15105(b).

4.2 Changes Made to the Draft IS/MND

The City has made the following changes to the Draft IS/MND and has incorporated them into the Final IS/MND. These modifications clarify, amplify, or make minor changes to the Draft IS/MND. Revisions to the Draft IS/MND have not resulted in new significant impacts or increased the severity of an impact.

Where the responses indicate additions or deletions to the text of the Draft IS/MND, additions are included as <u>underlined text</u>, deletions as ~~stricken text~~. The changes are listed by section and page number.

4.2.1 Changes Made in Response to Comments

Clarification/Revision

The following modifications have been made to page 75 of the Draft IS/MND to augment Mitigation Measure BIO-1 for the inclusion of bat surveys.

Section 2.4, Biological Resources – Page 75

Mitigation Measure

BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk (*Accipiter cooperii*), a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City ~~project~~ shall implement the following to avoid and minimize impacts to nesting birds and raptors:

- During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than 7 days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of 7 days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again.
- The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles.
- If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the project. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys.
- If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.
- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

4.2.2 Changes Made by the Lead Agency

Clarification/Revision

The following modifications have been made to page 1 of the Draft IS/MND to include The Metropolitan Water District of Southern California (Metropolitan) as a Responsible Agency of the Program.

Section 1.0, Project Description – Page 1

1.1 Introduction

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works (Bureau of Engineering [BOE]), Los Angeles Sanitation and Environment (LASAN), and City of Los Angeles Department of Recreation and Parks (RAP), collectively referred to herein as the City, propose to implement the Stormwater Capture Parks Program (Program). The Program would include construction of stormwater capture facilities at nine City-owned parks to help capture surface flow and divert stormwater runoff from the Tujunga Wash Central Branch storm drain to recharge the San Fernando Groundwater Basin. All nine parks are located in the east San Fernando Valley along State Route (SR) 170 (**Figure 1-1**); these parks include: David M. Gonzales Recreation Center; Fernangeles Park; Strathern Park North; Whitsett Fields Park North; Valley Plaza Park North; Valley Plaza Park South; Alexandria Park; North Hollywood Park; and Valley Village Park (**Figure 1-2**).

The City is proposing to obtain financial assistance for the park projects through the Stormwater for Recharge Pilot Program (Recharge Pilot) that is administered by The Metropolitan Water District of Southern California (Metropolitan). The Recharge Pilot encourages development and monitoring of new and existing stormwater recharge projects by providing financial incentives for construction and/or monitoring equipment installation of project and supplemental reporting costs.

Metropolitan offers different incentive amounts for the Recharge Pilot based on project type (New Construction or Monitoring Equipment Installation):

<table>
<tr><td>PROJECT TYPE</td><td colspan="2">FUNDING COMPONENTS</td></tr>
<tr><td></td><td>Construction/Installation</td><td>Monitoring & Reporting</td></tr>
<tr><td rowspan="2">Monitoring Equipment Installation</td><td>Up to $350,000 reimbursement for eligible costs</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $500,000</td></tr>
<tr><td rowspan="2">New Construction</td><td>Up to 50% reimbursement of eligible costs, max of $850,000</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $1 million</td></tr>
</table>

The City has chosen the New Construction Project Type.

As a Responsible Agency, Metropolitan's Board of Directors will review and consider the proposal and environmental documentation prepared by the City in determining whether or not to approve financial assistance for the Program within the Recharge Pilot administrative process.

The Program would be consistent with Metropolitan's commitment to develop Recharge Pilot activities that would provide a better understanding of the connection between captured stormwater and water supply yield.

Clarification/Revision

The following modifications have been made to pages 82 and 83 of the Draft IS/MND to update the name of the library.

Section 2.5, Cultural Resources – Pages 82 and 83

Page 82

Less than Significant Impact with Mitigation. The cultural resources assessment identified three historic architectural resources within the Program area. These resources include: the David M. Gonzales Recreation Center featuring a clubhouse building dating to the park's period of significance of 1950 located approximately 65 feet from the Program construction footprint; North Hollywood Park featuring a maintenance building and pool house (65 feet and 100 feet from the Program construction footprint, respectively) and the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (located 100 feet from the Program construction footprint) dating to the park's period of significance of 1928–1931; and the 170 Freeway Pedestrian Overpass connecting Valley Plaza Park North and Whitsett Fields Park North located approximately 90 feet from a proposed diversion structure in Valley Plaza Park North. The North Hollywood Amelia Earhart Regional ~~Branch~~ Library is National Register of Historic Places (NRHP)-listed and, therefore qualifies as a historical resource.

Page 83

Mitigation Measures

CUL-1: In the event Program designs are further refined and individual Program site components change to encroach more closely than 50 feet to the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.

SECTION 5
Mitigation Monitoring and Reporting Program

The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Program has been prepared in accordance with Public Resources Code section 21081.6 and State CEQA Guidelines section 15091(d). The City will use this MMRP to track compliance with the Program mitigation measures. The City will consider the MMRP during the certification hearing for the Final IS/MND. The MMRP will incorporate all mitigation measures adopted for the proposed Program.

This MMRP summarizes potentially significant impacts and mitigation commitments identified in the Stormwater Capture Parks Program IS/MND. Table 5-1 provides the MMRP which includes all mitigation measures, monitoring/reporting action, monitoring timing, and responsible person(s) for implementation. Impacts and mitigation measures are presented in the same order as in the IS/MND. The columns in the table provide the following information:

- **Mitigation Measures:** The action(s) that will be taken to reduce the impact to a less-than-significant level.
- **Monitoring /Reporting Action:** This column outlines the appropriate steps to implement and verify compliance with the mitigation measures.
- **Monitoring Timing:** This column indicates the general schedule for conducting each monitoring task, either prior to construction, during construction, and/or after construction.
- **Responsible Person(s):** This column lists the agency responsible for ensuring implementation of the mitigation measure.

TABLE 5-1
MITIGATION MONITORING AND REPORTING PROGRAM - STORMWATER CAPTURE PARKS PROGRAM

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Air Quality			
AQ-1: Construction of the Program shall incorporate the following conditions: a. For all Program sites: The Program shall use off-road diesel-powered construction equipment that meets or exceeds the CARB and USEPA Tier 4 off-road emissions standards for equipment rated at 50 horsepower or greater and not identified under b or c. below. Such equipment will be outfitted with Best Available Control Technology (BACT) devices, including a CARB-certified Level 3 Diesel Particulate Filter or equivalent. These requirements shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. b. All dumpers/tenders used on-site shall either be certified Tier 3 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent; certified Tier 4 with a CARB-certified Level 3 Diesel Particulate Filter or equivalent, or alternatively fueled (e.g., gasoline, electric, CNG). c. At a minimum, the following equipment shall be electric: air compressors, cement and mortar mixers, concrete saws, forklifts, pumps. Diesel generators shall be replaced with electricity from the grid either permanent or temporary, or replaced with alternative (non-diesel) fuels. d. Equipment requirements identified under a, b, and c above shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. A copy of each unit's certified tier specification or model year specification and CARB or SCAQMD operating permit (if applicable) shall be available upon request at the time of mobilization of each applicable unit of equipment. e. During the site clearing and preparation, grading and excavation, and soil filling, revegetation, and park improvement phases, watering must be conducted a minimum of 4 times per day during dry weather. f. For Valley Plaza Park North only 2 dozers are allowed to operate on any portion of the site at one time. g. The City shall ensure: i. On-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits: 1. 185 trucks when 2 parks are concurrently under construction; 2. 180 trucks when 3 parks are currently under construction; 3. 170 trucks when 4 parks are concurrently under construction; 4. 160 trucks when 5 parks are concurrently under construction; 5. 150 trucks when 6 parks are concurrently under construction; 6. 140 trucks when 7 parks are concurrently under construction. Or;	Site Monitoring	Prior to Construction During Construction	The City Construction Contractor

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
ii. If the fleet is composed of a mix of 2014 or newer trucks, the City shall ensure that on-road haul trucks including delivery and those conveying excavated material do not exceed the following daily truck limits: 1. 240 trucks when 2 parks are concurrently under construction; 2. 230 trucks when 3 parks are concurrently under construction; 3. 220 trucks when 4 parks are concurrently under construction; 4. 210 trucks when 5 parks are concurrently under construction; 5. 200 trucks when 6 parks are concurrently under construction; 6. 190 trucks when 7 parks are concurrently under construction.			
Biological Resources			
BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk (*Accipiter cooperii*), a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City shall implement the following to avoid and minimize impacts to nesting birds and raptors: ● During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than 7 days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of 7 days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again. ● The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles. ● If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the Program. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys. ● If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival. ● Prior to removal of trees in any of the parks, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The	Site Survey by a Qualified Biologist	Prior to Construction During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
surveys should encompass a minimum buffer area of 100 feet around the parks. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.			
Cultural Resources			
CUL-1: In the event Program designs are further refined and individual park project components change to encroach more closely than 50 feet to the North Hollywood Amelia Earhart Regional Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.	Plan Preparation Site Monitoring by a Qualified Archeologist Historian	Prior to Construction During Construction	The City
CUL-2: Prior to the start of ground-disturbing activities, the City shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (U.S. Department of the Interior, 2008) to carry out the following cultural resources mitigation measures.	Site Monitoring by a Qualified Archeologist	Prior to Construction During Construction	The City
CUL-3: Prior to start of ground-disturbing activities, the qualified archaeologist shall prepare a cultural resources sensitivity training module to be used as part of the City's Worker Environmental Awareness Program (WEAP) training. All construction personnel shall receive sensitivity training prior to beginning work onsite. Construction personnel should be informed of the types of archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. The City should ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.	Personnel Training by a Qualified Archeologist	Prior to Construction During Construction	The City Construction Contractor
CUL-4: Prior to the start of any project-related ground-disturbing activities, the qualified archaeologist shall prepare a Cultural Resources Monitoring Plan (CRMP) in consultation with Tribes that requested consultation under AB52. The CRMP shall stipulate the location and timing of archaeological and Native American monitoring, which shall include all ground-disturbing activities in each of the nine parks that exceed the depths of undocumented fill as documented by geotechnical testing. The qualified archaeologist shall review engineering plans for each of the nine parks to determine where ground-disturbing activities will exceed the depths of undocumented fill at each park to determine the timing and locations of monitoring to be included in the CRMP. The CRMP shall include monitoring protocols to be carried out during Program-related construction. The CRMP shall stipulate that Native	Plan Preparation Site Monitoring by a Qualified Archeologist	Prior to Construction During Construction Post Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
American monitors associated with any of the Tribes that have been consulted with under AB52 be retained to monitor Program-related ground disturbance stipulated in the CRMP. The CRMP shall contain an allowance that the Qualified Archaeologist, based on observations of subsurface soil stratigraphy or other factors during initial grading, and in coordination with the Native American monitor(s) and the City, may reduce or discontinue monitoring as warranted if it is determined that the possibility of encountering archaeological deposits is low. The CRMP shall outline the appropriate measures to be followed in the event of unanticipated discovery of cultural resources during Program implementation, including that all ground disturbance within 100 feet of an unanticipated discovery shall cease until a treatment plan is developed by the qualified archaeologist in coordination with the City and the Native American monitor(s) and which will consider the resources archaeological and tribal value. The CRMP shall identify avoidance as the preferred manner of mitigating impacts to cultural resources. The CRMP shall establish the criteria utilized to evaluate the significance (per CEQA) of the discoveries, methods of avoidance consistent with CEQA Guidelines Section 15126.4(b)(3), as well as identify the appropriate treatment to mitigate the effect of the Program if avoidance of a significant resource is determined to be infeasible. The CRMP will also include provisions for the treatment of archaeological sites that qualify as unique archaeological resources pursuant to Public Resources Code Section 21083.2, which places limits on the costs of mitigation for unique archaeological resources. The plan shall also require the preparation of a monitoring report following the completion. The monitoring report will be submitted to the City for review and comment and a final copy will be filed at the SCCIC. The CRMP shall be submitted to the City and the appropriate Native American representatives who have been consulted with under AB52 for review prior to the start of Program-related ground disturbance.			
CUL-5: In the event of the unanticipated discovery of archaeological materials during Program implementation, all work shall immediately cease in the area (within approximately 100 feet) of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has conferred with the City and the Native American monitors on the significance of the resource. If it is determined that the discovered archaeological resource constitutes a significant resource, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the City and Native American monitors that provides for the adequate recovery of the scientifically consequential information contained in the archaeological resource. The City shall consult the appropriate Native American representatives in determining treatment and disposition for prehistoric or Native American resources to ensure cultural values ascribed to the resource beyond those that are scientifically important are considered.	Site Monitoring by a Qualified Archeologist	During Construction	The City Construction Contractor
CUL-6: If human remains are encountered, all work shall halt in the vicinity (within 100 feet) of the find and the Los Angeles County Coroner shall be contacted in accordance with PRC Section 5097.98 and Health and Safety Code Section 7050.5. If the County Coroner determines that the remains are Native American, the NAHC will be notified in accordance with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by Assembly Bill 2641). The NAHC will designate a Most Likely Descendent (MLD) for the remains per PRC Section 5097.98. Until the landowner has conferred with the MLD, the City shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally	Site Inspection	During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
accepted cultural or archaeological standards or practices, and that further activities take into account the possibility of multiple burials.			
Geology and Soils			
GEO-1: The City shall implement the recommendations provided in the geotechnical investigations for each of the park project sites. In the event that the depth to groundwater rises to less than 50 feet bgs as measured in nearby wells, the stormwater infiltration process shall be stopped and the stormwater routed to the surface storm drain system until groundwater depths decrease to below 50 bgs.	Site Monitoring	During Construction Post Construction	The City
GEO-2: Prior to the start of construction activities, the City shall retain a Qualified Paleontologist that meets the standards of the Society of Vertebrate Paleontology (2010) to carry out all mitigation measures related to paleontological resources.	Site Monitoring	Prior to Construction During Construction	The City
GEO-3: Prior to start of any ground-disturbing activities, the Qualified Paleontologist shall contribute to any construction worker cultural resources sensitivity WEAP training materials outlined in Mitigation Measure CUL-2, either in person or via a training module provided to the Qualified Archaeologist. This training shall include information on what types of paleontological resources could be encountered during excavations, what to do in case an unanticipated discovery is made by a worker, and laws protecting paleontological resources. All construction personnel shall be informed of the possibility of encountering fossils and instructed to immediately inform the construction foreman or supervisor if any fossils are unexpectedly unearthed in an area where a paleontological monitor is not present. The City shall ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.	Personnel Training by a Qualified Paleontologist	Prior to Construction During Construction	The City
GEO-4: The Qualified Paleontologist shall supervise a paleontological monitor meeting the Society for Vertebrate Paleontology standards (2010) who shall be present during all excavations exceeding 15 feet. Monitoring shall consist of visually inspecting fresh exposures of rock for larger fossil remains and, where appropriate, collecting wet or dry screened sediment samples of promising horizons for smaller fossil remains. Monitoring can be reduced to part-time inspections or ceased entirely if determined adequate by the Qualified Paleontologist in consultation with the City. Monitoring activities shall be documented in a Paleontological Resources Monitoring Report to be prepared by the Qualified Paleontologist at the completion of construction and shall be provided to the City and filed with the Natural History Museum of Los Angeles County within 6 months of Program completion.	Site Monitoring by a Qualified Paleontologist	During Construction	The City
GEO-5: If a unique geologic feature or paleontological resource is discovered during construction, the paleontological monitor shall be empowered to temporarily divert or redirect grading and excavation activities in the area of the exposed fossil to facilitate evaluation of the discovery. An appropriate buffer area shall be established by the Qualified Paleontologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the Qualified Paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist in removing rock samples for initial processing and evaluation of the find. All significant fossils shall be collected by the paleontological monitor and/or the Qualified Paleontologist. Collected fossils shall be prepared to the point of identification and catalogued before they are submitted to their final repository. Any fossils collected shall be curated at a public, non-profit institution with a research interest in the materials, such as the Los Angeles County Natural History	Site Monitoring by a Qualified Paleontologist	During Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Museum, if such an institution agrees to accept the fossils. If no institution accepts the fossil collection, they shall be donated to a local school in the area for educational purposes. Accompanying notes, maps, and photographs shall also be filed at the repository and/or school.			
Hazards and Hazardous Materials			
HAZ-1: The City or its construction contractor shall ensure that fueling of vehicles or storage of fuel or other chemicals would occur at the furthest extent possible from an existing school site.	Site Monitoring	During Construction	The City Construction Contractor
HAZ-2: For all schools located adjacent to a proposed work area, the City shall coordinate school safety routes, which should include, but not be limited to: ● Maintaining in place all crosswalks along the safe routes to and from the school (for Pacoima Charter School these would include Norris Avenue, Van Nuys Boulevard, Pierce Street, and Herrick Avenue). ● Designating a safe location for school buses and parents to drop off and pick up students. ● Designating a safe parking area for parents to wait for/pick up school children. ● Maintaining sidewalks open to pedestrian traffic during construction. ● Additional safety measures must be adopted during construction to protect the students and the public, including k-railing, secured fencing with screen, clear signing, temporary striping, and a flagger for trucks entering and existing the construction zone. Flaggers should also be considered at crosswalks while students are present. ● Close coordination with the impacted school and the Los Angeles Unified School District for input on the school safety route design and frequent communication during construction. ● Extensive outreach program for the school and the community describing safety measures and construction schedules. ● Restrict construction times to avoid before and after school timeframes while children may be walking to and from school, and while school is in session, as feasible.	Safety Planning Notification Site Monitoring	During Construction	The City Construction Contractor
HAZ-3: The City and its contractor shall conduct further investigation of the nature and extent of landfill materials and contaminated soil at the Strathern Park North site, under the oversight of the City of Los Angeles Local Enforcement Agency (LEA). Undocumented waste shall be delineated and sampled for chemicals of concern related to waste materials. The project shall avoid construction within the delineated waste mass, as feasible. If avoidance of the waste mass is not feasible, the City shall submit a work plan to the LEA that documents the results of the waste delineation, details the specifics of the construction project and how it relates to the onsite waste, describes the procedures for dealing with the waste, and outlines the environmental monitoring procedures that would be implemented during construction. Upon approval of the work plan, the City and its contractor shall remove the landfill materials and any soil with chemical concentrations above regulatory action levels to the satisfaction of the LEA and properly dispose of it at a permitted facility. An as-built report shall be submitted to the LEA after completion of the project.	Site Survey Plan Preparation	Prior to Construction During Construction Post Construction	The City

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
Noise			
NOI-1: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), the contractor shall ensure that all construction equipment, fixed or mobile, are equipped with properly operating and maintained noise shielding and muffling devices, consistent with manufacturers' standards. The contractor shall use muffler systems (e.g., absorptive mufflers) that provide a minimum reduction of 5 dBA compared to the same equipment without an installed muffler system, reducing maximum construction noise levels. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturers' specifications. The contractor shall also keep documentation on-site verifying compliance with this measure.	Site Monitoring	During Construction	The City Construction Contractor
NOI-2: For construction activities adjacent to noise-sensitive receptors (e.g., residences and schools), where physically and technically feasible, the contractor shall provide an 8-foot-tall to 20-foot-tall temporary fence or other barrier placed between the project construction area and the sensitive receptor with a performance standard of achieving a 15 dBA noise level reduction at the sensitive receptors. The temporary fence or barrier shall be used during peak noise-generating construction phases when the use of heavy equipment is prevalent. A noise barrier is not required if it would pose a safety risk or unreasonably prevent access to the construction area as deemed by the on-site construction manager, such as in areas that have limited equipment maneuvering space or access.	Temporary Fence/Barrier Site Monitoring	During Construction	The City Construction Contractor
NOI-3: Limit engine idling of construction equipment (e.g., haul trucks, loaders) to a minimum of 200 feet from any boundary of the nearest sensitive receptors.	Site Monitoring	During Construction	The City Construction Contractor
NOI-4: Prior to commencement of construction activities, the City shall notify in writing adjacent residents, schools and businesses near the various park project sites, of proposed construction activities and the tentative schedule. The notices shall also provide a contact person and hotline where local residents, schools, or business owners can call during active construction with questions or comments. The City shall respond to inquiries regarding construction noise and vibration. Notices and construction signs will include a website address which will be updated quarterly and will include Program-related information.	Notification	Prior to Construction	The City
NOI-5: The operation of construction equipment that generates high levels of vibration, such as large bulldozers and loaded trucks, shall be prohibited within 45 feet of the property lines of existing residential and school uses adjacent to the various park project sites. Instead, rubber-tired equipment not exceeding 247 horsepower shall be used in these areas during construction within 45 feet from the sensitive receptor locations.	Site Monitoring	During Construction	The City Construction Contractor
Transportation			
TR-1: For parks where construction would occur outside of park facilities or that may impact roadways surrounding park areas, a CTMP shall be developed by the City or its contractor and approved by LADOT prior to the start of construction. The CTMP may include, but is not limited to the following:	Plan Preparation Site Survey Notification	Prior to Construction During Construction	The City Construction Contractor

Mitigation Measure	Monitoring / Reporting Action	Monitoring Timing	Responsible Person(s)
● Work area traffic control plans for all in-street construction sites to the satisfaction of LADOT, as appropriate prior to the start of any construction work. The plans shall include such elements as the location of any lane closures, restricted hours during which lane closures would not be allowed, local traffic detours, protective devices and traffic controls (such as pavement markings, barricades, cones, flagmen, lights, warning beacons, temporary traffic signals, turning movement restrictions, warning signs), access to abutting properties, and provisions to maintain emergency access through construction work areas. ● The dates and locations where in-street and off-street construction activities are planned. ● If any street segments will be limited to one-way traffic, prepare detour plans over parallel routes. ● Require signage indicated alternative routes where construction will occur. ● Identify and consolidate staging areas for equipment and materials, as feasible. ● Consolidate truck trips, such that multiple worksites can be served, as feasible. ● Promote carpooling among workers. ● Contact emergency service providers in the project vicinity to notify of the location, hours, and duration of in-street construction. Provide advance notice of any lane closures and changes to local access and identity alternative routes where appropriate.

SECTION 3
Comment Letters

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works Bureau of Engineering (BOE) and Bureau of Sanitation (LASAN), and Department of Recreation and Parks (RAP), are collectively referred to herein as the "City." LADWP acting as Lead Agency circulated the Draft Initial Study/Mitigated Negative Declaration (Draft IS/MND) for the Stormwater Capture Parks Program (Program) for public review for 30 days (January 7, 2021 through February 7, 2021) in accordance with the requirements of the California Environmental Quality Act (CEQA) Guidelines Section 15072(a). BOE, LASAN, and RAP will act as Responsible Agencies. The City received a total of eight comment letters during the public review period, which are listed in **Table 3-1** and are included within this chapter. The letters have been marked with brackets that delineate comments pertaining to environmental issues and the information and analysis contained in the Draft IS/MND. Responses to such comments are provided in Section 4.

TABLE 3-1

7	County of Los Angeles Fire Department	February 9, 2021
8	Joanne D'Antonio	February 8, 2021

SECTION 4
Response to Comments

4.1 Comments on the Draft IS/MND and Response to Comments

The responses to comments included in this section correspond to each comment letter outlined in Section 3.

Letter 1: Miya Edmonson (California Department of Transportation)

Comment 1-A

The commenter summarizes the project description.

Response 1-A

The comment is noted and will be included in the project record.

Comment 1-B

The commenter states that an encroachment permit would likely be required for any project work, including road closures, done on or near California Department of Transportation's (Caltrans) right of way.

Response 1-B

As noted on page 33 of the Draft IS/MND, the City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities. In addition, Caltrans is an active partner in the Program, providing some funding and assisting with project level designs.

Comment 1-C

The commenter states that a Caltrans transportation permit is required for transporting any heavy construction equipment and/or materials with oversized-transport vehicles on State Highways.

Response 1-C

The City and/or its contractors will coordinate with Caltrans and will obtain all necessary permits prior to construction activities.

Comment 1-D

The commenter recommends that project construction traffic is limited to off-peak periods to minimize potential impacts on State facilities.

Response 1-D

As outlined in Mitigation Measure TR-1, the City and/or its contractors will coordinate with Los Angeles Department of Transportation (LADOT) in order to prepare a construction traffic management plan (CTMP) for the Program which will include time of day restrictions, and time limitations for construction traffic.

Comment 1-E

The commenter requests submission of a construction traffic management plan to Caltrans for review if State facilities are expected to have delays. The commenter request that the traffic management plan includes details on any traffic delays that would occur on State facilities during construction, and alternate bicycle and pedestrian routes for any routes that would be affected during construction.

Response 1-E

The City will submit the CTMP to Caltrans for review if delays are expected on State facilities.

Comment 1-F

The commenter expresses support for Transportation Demand Management (TDM) strategies which the City has incorporated into the Program and recommends additional options to further reduce Vehicle Miles Traveled (VMT) and greenhouse gas emissions impacts.

Response 1-F

The Draft IS/MND concluded that Program impacts to VMT and greenhouse gas emissions would occur at levels that are below CEQA significance thresholds, without implementation of any mitigation measures.

Letter 2: Luis Suarez

Comment 2-A

The commenter requests more information regarding the environmental impacts that would occur on homes surrounding Fernangeles Park.

Response 2-A

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules and that Program impacts remain below the specific impact thresholds identified in Appendix G of the

CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 2-B

The commenter expresses concern regarding the potential for groundwater saturation in surrounding neighborhoods as a result of the proposed infiltration galleries at Fernangeles Park.

Response 2-B

The Program would include construction of underground infiltration galleries, which would capture surface flow and divert stormwater runoff from the Caltrans pump discharge to recharge the San Fernando Groundwater Basin. The infiltration galleries will be constructed of concrete and are designed to retain flows for percolation into the San Fernando Groundwater Basin. The ground surface surrounding the park would be restored to support recreational uses similar to current conditions . The Draft IS/MND evaluates the potential for groundwater mounding to occur that could affect surface infrastructure. A technical analysis prepared by Todd Groundwater Consultants is included as Appendix E. As noted in Table 1 of Appendix E, the infiltration galleries would range from 16 to 29 feet below ground surface and the groundwater levels in the area range from 105 to 335 feet below the ground surface. Mitigation measure GEO-1 has been included to monitor groundwater levels and reduce flow diversions when groundwater is within 50 feet of the surface. With mitigation implemented, the Draft IS/MND concludes that the potential for ele vated groundwater levels would be minimized.

Letter 3: Marie Gordon

Comment 3-A

The commenter requests information regarding start and end dates for Program construction activities that would occur near two senior citizen apartment buildings located along Vanowen Street, between Whitsett Avenue and Rhodes Avenue, just south of Whitsett Fields Park North.

Response 3-A

As noted in Table 1-6 on page 40 of the Draft IS/MND, construction activities at Whitsett Fields Park North are expected to take approximately 18 months, starting in June 2025 and ending in November 2026. Construction at Valley Plaza Park North, located east of I-170 on Vanowen Street, is expected to take approximately 17 months, starting in November 2023 and ending in March 2025. Construction work hours would generally be restricted to times between 7 A.M. and 7 P.M., Monday through Friday.

Comment 3-B

The commenter expresses concern regarding construction mitigation measures and their potential to minimize environmental impacts on senior citizens living in nearby apartments. The commenter states that the environmental impacts of prior projects were not effectively mitigated.

Response 3-B

Residents in the vicinity of Program sites may experience temporary impacts related to construction. The City and its construction contractors are required to implement mitigation measures to ensure that nearby residents are notified of tentative construction schedules, and that Program impact levels remain below the specific thresholds identified in Appendix G of the CEQA Guidelines. For a detailed discussion of anticipated environmental impacts, please refer to the Draft IS/MND. With respect to neighborhood impacts, the IS/MND describes effects to aesthetics on page 46, air quality on page 51, biological resources on page 72, noise on page 122, recreational resources on page 138, and traffic on page 140.

Comment 3-C

Commenter states that the Notice of Intent (NOI) for the Program is dated January 7, 2021 but was not received until January 20, 2021.

Response 3-C

The comment is noted and will be included in the project record. The public review period for the Draft IS/MND was from January 7, 2021, to February 7, 2021. The commenter received the NOI within the public review period of the Draft IS/MND in compliance with CEQA.

Letter 4: Brenda Dalusong

Comment 4-A

The commenter requests that the City consider construction of sidewalks around the perimeter of Fernangeles Park as part of the Program's proposed recreational facilities enhancements. The commenter states concern for pedestrian/motor vehicle safety around the park due to the lack of sidewalks available for pedestrian use.

Response 4-A

Figures 1-4 through 1-12 provide architectural drawings for each of the proposed parks that include public access and pedestrian circulation to support existing recreational uses.

Letter 5: Erinn Wilson-Olgin (California Department of Fish and Wildlife)

Comment 5-A

The comment acknowledges that California Department of Fish and Wildlife (CDFW) received the Draft IS/MND for review and to provide comments.

Response 5-A

Comment noted.

Comment 5-B

CDFW disagrees with the City's impact analysis, which finds that the Project's diversion of water would not impact biological resources

The Project would divert dry season flow and stormwater totaling 3,010 acre-feet per year (AFY). The water would otherwise proceed downstream via concrete channels to the Los Angeles River. The Draft IS/MND concluded that "no beneficial uses would be impacted." However, flow reduction could have a significant impact on downstream biological resources, especially during the dry season proceeding after a below-average water year.

Response 5-B

The Draft IS/MND on pages 74 and 77 describes that the Program would reduce dry season flows from the Tujunga Central Branch channel that would reduce water in the Los Angeles River. In response to the comment the sentence on page 77 of the Draft IS/MND has been revised as follows:

> The Los Angeles River currently discharges an average of over 100 cubic feet per second (cfs) to the ocean during dry weather (City of Los Angeles 2018). The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent of total annual flow or approximately 4 percent of dry weather flow), and as a result no beneficial uses, including biological resources, would be significantly impacted.

As noted in the comment, the reduction of dry weather flows is itself an impact. Therefore, the changes to the text provided above as requested in the comment are appropriate. The Draft IS/MND identifies the reduced flow impact on page 74, but concludes that no riparian or aquatic habitat would be removed or adversely affected within the downstream reaches of the Los Angeles River. Therefore, since no habitat would be lost or stressed, the flow reduction would be a less than significant impact. The analysis relies on a de minimis impact conclusion. That is, the reduction of 1.4 percent of total flow and approximately 4 percent of dry weather flow in the river would not result in loss of habitat or result in reduced habitat quality. Rather, diverting dry-weather urban runoff would benefit water quality. The Draft IS/MND describes on pages 74 and 77 how beneficial uses are well supported by the remaining dry season flows. This evidence is outlined further below.

The Draft IS/MND describes in Section 1.5 that six of the nine Program sites (see table below) would require insertion of diversion structures within underground storm drain pipes. No habitat values exist within the buried storm drain pipes. The remaining four Program sites would require installation of diversion structures within existing Tujunga Central Branch concrete box channel or reinforced concrete box culvert. The watershed drained by this Tujunga Central Branch

channel is a small portion of the San Fernando Valley adjacent to but outside of the Tujunga Wash drainage area, representing 1.7 percent of the total Los Angeles River watershed.

Infiltration Gallery Location	Diversion Structure Installation
David M. Gonzales Recreation Center	Underground Storm Drain Pipe
FernAngeles Park	Underground Storm Drain Pipe
Whitsett Fields Park North	Underground Storm Drain Pipe
Strathern Park North	Underground Storm Drain Pipe
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert
Valley Plaza Park South	Concrete Channel
Alexandria Park	Concrete Channel
North Hollywood Park	Concrete Channel
Valley Village Park	Underground Storm Drain Pipe

The Draft IS/MND describes on page 74 that the Tujunga Central Branch channel is concrete-lined with no ecological value. As a result, direct impacts to habitat values from installing diversion structures would not adversely affect biological resources. Furthermore, the Draft IS/MND concludes on pages 74 and 77 that the proposed diversions would result in a small reduction of the flow in the Los Angeles River compared to the current flow, including in the dry season, and would not result in measurable effects to biological resources. The Draft IS/MND references the hydrological analysis conducted by the City for the One Water LA Program and cites that currently an average of 100 cubic feet per second (cfs) reaches the ocean in the concrete channel of the Los Angeles River during dry weather (City of Los Angeles 2018). The Program diversions represent an annual average flow of approximately 4 cfs or 4 percent of the dry weather flows to the ocean. The Draft IS/MND concludes on page 77 that the reduction caused by the project would represent 1.4 percent of the total flow in the river on an annual average. Since the river discharges substantial flow to the ocean in the dry season (>100 cfs), the Draft IS/MND concludes that the proposed project's 1.4 percent diversion of total flows and 4 percent of dry season flows would not result in significant impacts to biological resources.

The Draft IS/MND also concludes on page 153 that the flow reductions would not result in a cumulatively significant reduction, including in the dry season. This conclusion is consistent with the One Water LA Study, which provides an overview of stormwater flows in Chapter 3and the Los Angeles River in Chapter 4. (City of Los Angeles 2018).

In addition to the published One Water LA study, the City has been participating in the Los Angeles River Flows Project, a comprehensive new hydrologic study of the river led by the Southern California Coastal Watershed Research Project (SCCWRP) in partnership with the State Water Resources Control Board (SWRCB). This new study is called the Los Angeles River Flows Project and is sponsored by the City of Los Angeles (by and through LADWP and LASAN), Los Angeles Regional Water Quality Control Board (LARWQCB), and the Los

Angeles County Sanitation Districts (LACSD). SCCWRP is a quasi-public agency established to support Southern California governmental agencies with third-party, science-based analysis. The Los Angeles River Flows Project was initiated in 2019 expressly to evaluate potential effects of cumulative flow reductions in the Los Angeles River, including reductions in WRP discharges and future stormwater capture projects such as the proposed Project. CDFW has been actively participating in the Project as a member of the Technical Advisory Committee (TAC).

In May 2021, SCCWRP published a report titled Process and Decision Support Tools for Evaluating Flow Management Targets to Support Aquatic Life and Recreational Beneficial Uses of the Los Angeles River as part of the Los Angeles River Flows Project (LA River Flows Project Final Report) (SCCWRP, 2021b). This new Final report, included by reference with this Final IS/MND, characterizes the environmental attributes of the river channel and evaluates flows that support those attributes, providing flow-ecology relationships helpful in understanding dry season flow reduction impacts on ecological values. The report develops a set of tools to evaluate future flow management scenarios. One of the three objectives noted in the report is to:

> "Produce tools and approaches to help evaluate how potential modified flow regimes in the LA River may affect the likelihood of supporting aquatic life and recreational beneficial uses" (SCCWRP, 2021b)

The results of this study directly confirm the conclusions outlined in the IS/MND, including an evaluation of the effects to focal species of reduced storm flows during the dry season. See response to comment 5-I for more discussion on the new study and the conclusions regarding impacts to ecological values from reduced dry weather flow.

Comment 5-C

The Draft IS/MND does not provide sufficient analysis of the Project's potential biological impacts to allow CDFW to determine the Project's significance or need for mitigation.

Data Source: The Draft IS/MND uses data from the 2015 *Los Angeles River Ecosystem Restoration Integrated Feasibility Report* (USACE 2015). The U.S. Army Corp of Engineers (USACE) report analyzes the feasibility of restoring an 11-mile stretch of the Los Angeles River from Pollywog Park to Downtown Los Angeles, referred to in the report as the ARBOR reach (Area with Restoration Benefits and Opportunities for Revitalization) (USACE 2015). Citing the USACE report, page 77 of the Draft IS/MND states, "USACE estimated that existing water sources provide 211,348 AFY of flow within the Los Angeles River watershed on an annual basis. The proposed diversion would be approximately 1.4 percent of the existing water source [...]. The volume of water diverted during dry weather flow by the proposed Program would be a small percentage of the current downstream flows (1.4 percent), and no beneficial uses would be impacted.

The Draft IS/MND may have underestimated the percentage of water diverted from the Los Angeles River in using 211,348 AFY as the basis for deriving 1.4 percent. After factoring in water demand (e.g., infiltration, evaporation, evapotranspiration), the USACE estimated that flow

would be reduced from 211,348 AFY to 143,793 AFY annually and 29,166 AFY in the summer (April through September) (USACE 2015). Based on reduced volumes, the Project's proposed diversion would be approximately 2.2 percent annually, an increase from 1.4 percent. During the summer, diversion would be approximately 10.3 percent. Based on the above, the Draft IS/MND's impact analysis may not have accurately estimated the proportion of water the Project would divert from the Los Angeles River.

Response 5-C

The calculation in the comment asserting a 10.3 percent reduction is inaccurate in that it assumes the entire diversion estimate of the proposed Program (3,010 AFY) will occur between April and September. It would be more appropriate when calculating the six-month dry season percentage from the 29,166 AFY flow assumption to compare half the annual anticipated diversion, which would be 1,505 AFY, calculated as 5.14 percent of the total dry season flow. A different way of calculating the contribution of flows attributed to the Tujunga Central Branch channel is to compare the project's diversion estimates with flow estimates at the ocean. The One Water LA Report (City of Los Angeles 2018) estimates that the river discharges 100 cfs to the ocean during summer months. The Program's proposed diversion of 3,010 AFY would constitute approximately 4 percent of the existing flow to the ocean during the summer months. This would be a conservative assumption since it does not attribute any stormwater capture to the proposed Program. The Draft IS/MND concludes that the contribution of flow to the Los Angeles River from the Tujunga Central Branch channel during the dry season is small (1.4 percent of the total volume and 4 percent of dry weather flow) compared to other sources. Furthermore, the watershed represents only 1.7 percent of the total watershed feeding stormwater to the Los Angeles River. Based on these flow estimates, the Draft IS/MND concludes that the proposed project would not significantly affect the ecology of the river.

The City, including LADWP, is participating in the Los Angeles River Flows Project in partnership with the SWRCB, and in close coordination with CDFW. The Los Angeles River Flows Project has been initiated by SWRCB to better understand the water demands of beneficial uses in the river, and to support future flow management priorities with science-based demand characterizations. See response to comment 5-I for more discussion on the new study.

Comment 5-D

Seasonality: The Draft IS/MND does not thoroughly analyze the potential significance of water diversion depending on the season. During the dry season, typically April through September in southern California, the Los Angeles River is largely maintained by urban runoff and discharge from WRPs. Diverting water could be significant during the dry season and could either significantly reduce water flow or result in complete loss of water flow from the Tujunga Central Branch channel to the Los Angeles River.

Response 5-D

The Draft IS/MND does evaluate the seasonality of the potential effects of the Program on page 74. The assessment describes the effects of the proposed Program on both dry weather flows and wet weather flows. The Draft IS/MND notes on pages 74 and 77 that dry weather flows would be reduced slightly but would not result in loss of habitat. This is substantiated by the fact that 100 cfs currently discharges to the ocean in dry weather indicating a surplus of flow. Furthermore, the Draft IS/MND also points out that the ecological values of the river would be enhanced with the reduction of pollutant daily loads conveyed in dry weather flow. The water quality benefits of stormwater capture on downstream habitat values are described further in One Water LA, Chapter 4 Los Angeles River Study (City of Los Angeles 2018), as a fundamental benefit of the City's Program, and supports the water quality objectives of the regional Municipal Separate Storm Sewer System (MS4) stormwater NPDES permit of which the City is a participating permittee. See response to comments 5-C and 5-G.

Comment 5-E

Drought: The Draft IS/MND does not analyze the potential significance of water diversion during a below-normal water year. Since 2000, the longest duration of drought in California lasted between 2011 and 2019 (USGS 2021) and in southern California, between 2012 through 2016 (Los Angeles Almanac 2021). The 2017-2018 rainfall season was below normal and the driest for Los Angeles since 2006-2007 (Los Angeles Almanac 2021). Diverting water during a below normal rainfall year may significantly reduce water flow or result in complete loss of water flow.

Response 5-E

Annual rainfall amounts vary in the Los Angeles River watershed, with multi-year droughts likely becoming more common. The City's Stormwater Capture Master Plan states that "although the average annual precipitation in downtown Los Angeles is 15.3 inches, it ranges from a low of 4.69 inches (2007) to a high of 30.6 (1998). The mountains that surround the coastal plain, and are tributary to the City, experience considerably more rainfall than downtown Los Angeles. For example, in Big Tujunga Canyon, annual rainfall ranged from 9.62 inches in 1989 to 53.93 in 1998." (LADWP Stormwater Capture Master Plan, 2015; p. 3) The watershed represents only 1.7 percent of the total LA River watershed. The reduction would not significantly reduce dry season flows. The comment does not provide any additional information not already considered in the Draft IS/MND. See response to comment 5-I.

Comment 5-F

Beneficial Uses: The concrete lined portions of the Los Angeles River support wildlife. These portions of the Los Angeles River are regionally significant, especially in a dense urban environment with substantial loss or alteration of the natural hydrologic regime and river ecosystems. A reduction of flow, especially dry season flow, could directly or indirectly impact biological resources through habitat modifications. Where the Los Angeles River overtops the concrete-lined channel, the resulting sheet flows allow phytoplankton (algae and cyanobacteria),

microorganisms, and herbaceous vegetation to establish. The algae provide habitat and a food source for benthic invertebrates, a vital food source for wading birds. The Los Angeles River provides habitat for hundreds of bird species, making these areas birding hotspots. The least Bell's vireo (*Vireo bellii pusillus*), an Endangered Species Act and CESA-listed endangered species, has been documented within the Glendale Narrows area. Least Bell's vireo depends on willow (*Salix* genus) riparian habitat. The ARBOR reach examined in the USACE report contains soft-bottom channels that support herbaceous and woody vegetation. Dominant species include black willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and arroyo willow (*Salix laevigata*) (USACE 2015). The middle reach of the Los Angeles River, specifically Glendale Narrows, supports anadromous fish that includes the Pacific lamprey (*Entosphenus tridentatus*), a California Species of Special Concern.

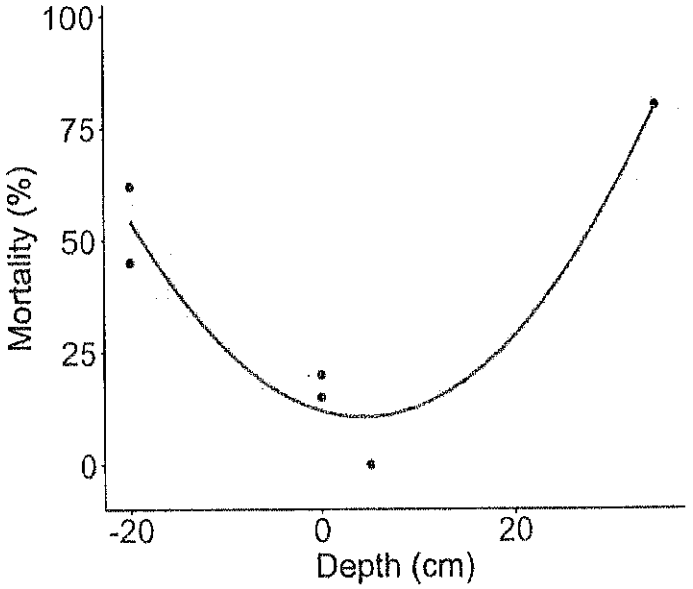
The Draft IS/MND concludes that "no beneficial uses would be impacted." The Draft IS/MND does not offer a quantitative analysis as to how it determined no impacts would occur. Moreover, the Draft IS/MND does not define what it considered to be "beneficial uses." Diverting water during the dry season could reduce the availability and extent of shallow water sheet flow downstream. This could potentially impact algae, benthic invertebrates, and birds. Willow riparian habitat may be impacted if reduction in flow leads to receding shoreline or lower water depth. Preliminary work of the Los Angeles River Flows Project show that black willow (*Salix gooddingii*) seedling mortality increases as water depth decreases (SWRCB 2019). Loss of suitable habitat may impact sensitive species such as least Bell's vireo. Anadromous fish have specific habitat requirements including water depth, velocity, and vegetation.

Response 5-F

The Draft IS/MND on pages 74-78 describes the valuable biological resources existing in the Los Angeles River that are supported by consistent surface flow. The Draft IS/MND cites the One Water LA Program to substantiate the values found in the river, including all the species described in the comment. The 4 percent reduction of the current 100 cfs in the lower river channel would not reduce habitat from sheet flow in the lower reaches of the river since the flows would continue to be greater than the low flow channel and would continue to overflow and maintain the sheetflow condition. Phytoplankton and herbaceous vegetation would continue to provide a food source for benthic invertebrates, and for wading birds, as noted in the comment. The Draft IS/MND does provide a quantitative assessment of the potential effect of the proposed Program by estimating a 1.4 percent flow reduction. This small average flow reduction would not result in measurable effects to habitat values in the concrete-lined Los Angeles River either in the Arbor Reach or in the concrete-lined portion of the lower river. Furthermore, the Draft IS/MND cites the One Water LA Study that states that far more water exits the Arbor Reach under current conditions than is proposed to be diverted by the proposed Program. That is to say, since more water exits the system than is contributed by stormwater, there would be sufficient quantity of flow to meet the existing ecological demand. The Draft IS/MND concludes that the calculated flow reductions would not impact beneficial uses.

The comment cites information from a report published for the Los Angeles River Flows Project in January 2021 that provides a habitat suitability assessment for species known to occur in the Los Angeles River. The citation notes that black willow seedling mortality increases with water depth reduction. This information is extracted from a life stage suitability curve provided in the report. The Assessment Report does not provide a conclusion on the optimal water flow depth in the Los Angeles River. Rather, the Habitat Assessment Report (SCCWRP 2021a) provides suitability curves that show a relationship with water depth and different life cycle stages for various species.

The figure below taken from that report shows that willow seedling mortality is more complex than stated in the comment: mortality is at a minimum at mean depths of around 5 cm and then increases with both reductions and increases in flow depth. In other words, germination occurs within a specific range of flow depth. .



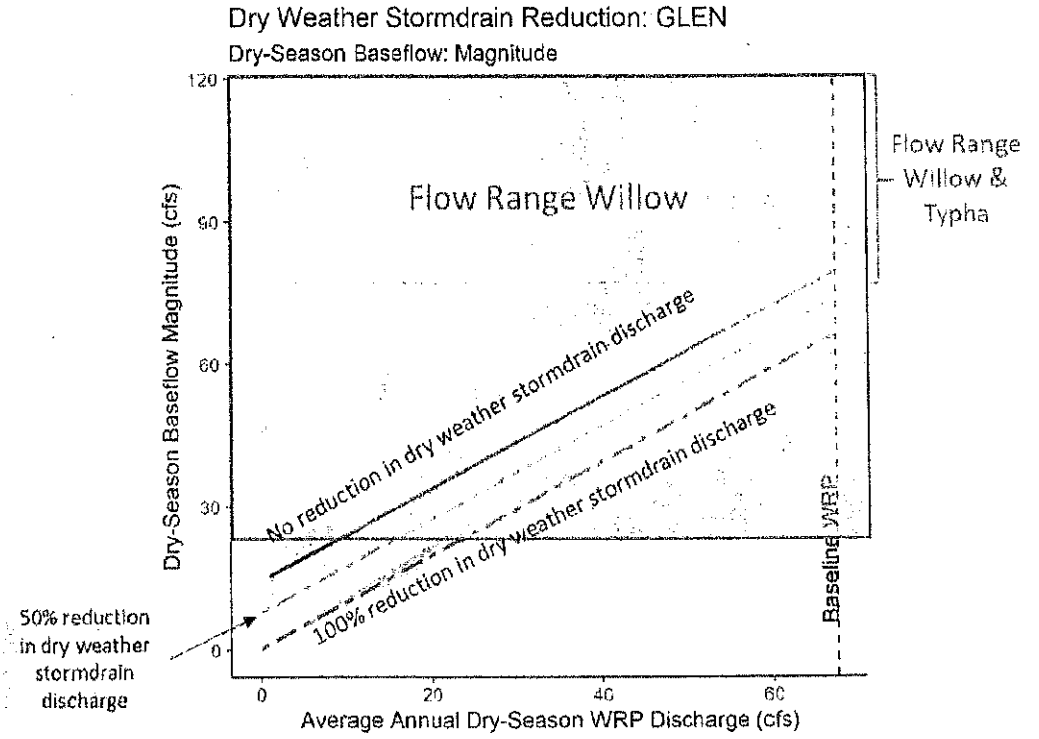


Figure 35. Habitat suitability curve of seedling mortality as a function of inundation/depth from water surface of Salix Gooddingii calculated through quadratic linear regression. Depth is defined as depth from surface i.e., -20 cm = 20 cm below surface, 20 cm = 20 cm above surface. Mean = 5 cm, p = 0.002, n=5.

The second figure, taken from the recently published SCCWRP flow study (SCCWRP 2021b) shows that willow in the Glendale Narrows area of the Los Angeles River can sustain a wide range of flow conditions. The graph shown below from the study shows that WRP discharges could be reduced by 80 percent and still support the existing willow. The WRP flow reduction of 80 percent illustrated, from 75 cfs to 15 cfs, is an order of magnitude greater than the proposed flow reduction from the proposed Program. The graph also shows that if all urban baseflows were captured, WRP discharges could be reduced by up to 68 percent and the existing willow habitat would be maintained. That is to say, a 100 percent reduction in urban baseflow across the Los Angeles River watershed (of which the proposed Program watershed comprises 1.7 percent by

area) would still allow for a 68 percent reduction in WRP flow and continue to support willow habitat. This substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.

The effect of stormwater diversion would reduce Los Angeles River flows less than 4 cfs in the dry season, compared to the current dry season average of 75 cfs in the Arbor Reach and 100 cfs where the Los Angeles River confluences with the Pacific Ocean. The remaining flow would provide for the needs of willow and other riparian vegetation. The conclusions illustrated in the SCCWRP study for black willow show that surface water depth is not a driving factor in the suitability of black willow habitat in the Los Angeles River. The comment does not identify any other citation supporting water needs for the riparian habitats See response to comment 5-I.

Comment 5-G

Cumulative Flow Reductions: The Draft IS/MND does not analyze whether the Program would result in significant impacts when considered with other existing or proposed water diversion projects in the Los Angeles River watershed. The cities of Burbank, Glendale, and Los Angeles plan to recycle more wastewater and reduce their discharges to the Los Angeles River for this purpose (SWRCB 2019).

Response 5-G

The Draft IS/MND concludes on page 153 that the proposed Program would not result in cumulatively significant effects to the environment. This conclusion is based on the quantitative analysis that 4 percent of dry weather flow (1.4 percent of total annual flow) is too small an amount to result in an appreciable, or measurable change in the habitat values currently exhibited in the Los Angeles River. Furthermore, the City has acknowledged that cumulative flow reductions in the future may include potential reductions in WRP discharges to support regional recycled water program objectives. To evaluate the effects of cumulative reductions in future flows that may include future diversions of WRP discharges, the SWRCB has conducted the Los Angeles River Flows Project. The study published by SCCWRP through the Los Angeles River Flows Project (SCCWRP 2021b) provides tools to all the river stakeholders to best manage the resource's beneficial uses. Future projects that may propose further diversions in dry weather flow may rely on this study to assess potential direct and cumulative effects of WRP discharge diversions. These future WRP diversions will be subject to Water Code Section 1211 Petitions, approved by the SWRCB.

In January 2021, SCCWRP published a report titled the Assessment of Aquatic Life Use Needs for the Los Angeles River Report (Assessment of Aquatic Life Report) (SCCWRP 2021a). This report characterizes habitat values in the river, and evaluates water demands of riparian and aquatic species known to occur in the river system. Habitat suitability curves have been developed for certain focal species based on the assessment. Habitat suitability curves were developed as part of a technical tool to assist the SWRCB in assessing potential WRP flow reductions in the Los Angeles River, but are not themselves flow recommendations.

The Assessment of Aquatic Life Report outlines habitat suitability criteria for three species: black willow, cattails (*Typha sp.*), and algae (*Cladophora sp.*). The study provides an overview of the cumulative effects of stormwater diversions to the overall flow in the Los Angeles River. The graphic provided in response to comment 5-F above summarizing the relationship between flow in the river and ecological water demands of willow substantiates the conclusion that the proposed Program dry weather flow reductions would not affect downstream beneficial uses significantly, and that it would be unreasonable to assume otherwise.

The City, including LADWP, is committed to maintaining a supportive role in the Los Angeles River Flows Project. See response to comment 5-I.

Comment 5-H

Diverting water from the Los Angeles River may impact biological resources downstream, especially during the dry season proceeding after a below-average water year. Impacts to any sensitive or special status species should be considered significant under CEQA unless they are clearly mitigated below a level of significance. Inadequate avoidance, minimization, and mitigation measures for impacts to sensitive or special status species will result in the Project continuing to have a substantial adverse direct, indirect, and cumulative effect, either directly or

through habitat modifications, on any species identified as a candidate, sensitive, or special-status species by CDFW or U.S. Fish and Wildlife Service.

Response 5-H

See responses to comments 5-G and 5-I.

Comment 5-I

Mitigation Measure #1: CDFW recommends LADWP provide additional analysis and evaluation of potential impacts on biological resources as part of the final environmental document. At a minimum, an additional analysis and report should provide the following:

Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Changes to Hydrology and Hydraulics

1. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

2. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

3. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

4. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Biological Resources Impact Assessment

5. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW

recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

6. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

   a. A summary of species-specific habitat requirements;

   b. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

   c. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

7. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

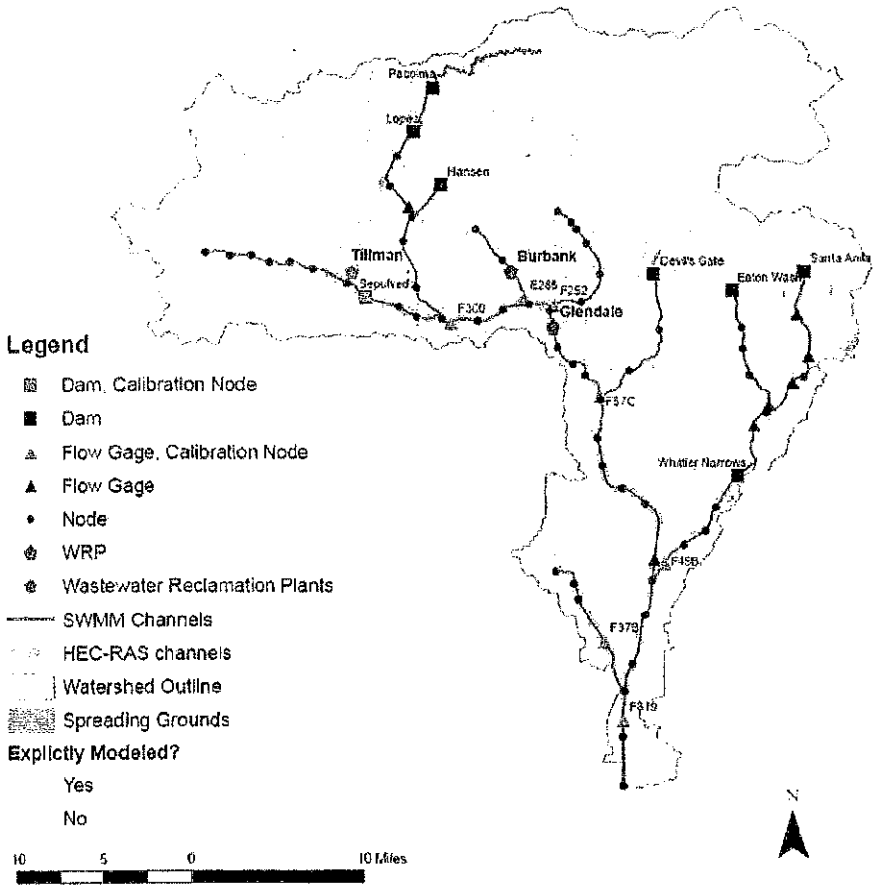
8. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

9. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response 5-I

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel, and that it would be unreasonable to assume otherwise. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required. However, in response to the comment and request for mitigation, the Los Angeles River Flows Project Final report (LA River Flows Project Final Report), published after the Draft IS/MND was published is incorporated by reference into this Final IS/MND. This robust hydrological, hydraulic, and ecological study of the Los Angeles River conducted by SCCWRP for SWRCB is designed to develop a set of tools and approaches to help evaluate future flow management scenarios. The Project applies the California Environmental Flow Framework (CEFF) approach to evaluating ecological flow relationships in California streams. The City is participating in the Los Angeles River Flows Project to assess how future flow diversions from WRPs may be best managed to support beneficial uses and management priorities in the river.

The LA River Flows Project Final Report is presented in this Final IS/MND to respond to this detailed comment. The Report was conducted over a two-year period, including input from numerous stakeholders including both LADWP and CDFW. The Report assists in evaluating the



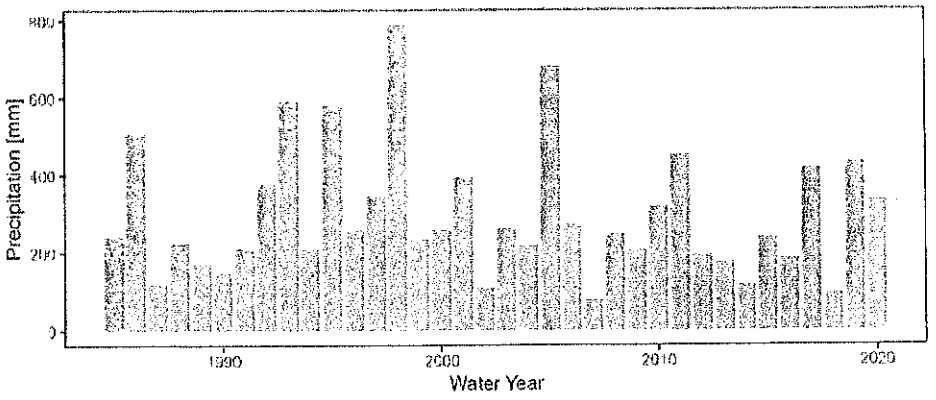
potential significance of the impacts of stormwater capture projects, such as the proposed Project, and includes all of the elements proposed in the comment and recommended mitigation measure. The following responses address each point in the comment:

Comment 5-Ia: Study Reach

1. CDFW recommends LADWP define the study area as a 15-mile reach of the Los Angeles River, bounded by the Los Angeles River's confluence with the Tujunga Wash tributary and proceeding downstream to the river's confluence with the Arroyo Seco tributary. LADWP should identify all sources of flow input within the study area to estimate the total annual and dry season flow. LADWP should assess potential Project related impacts on biological resources within this study reach.

Response to Comment 5-Ia

With respect to the Study Reach, the Los Angeles River Flows Project includes assessments of habitat values in the entire Los Angeles River from the Sepulveda Dam to the Pacific Ocean. This study area is larger than requested in the comment. The model domain included as Figure 5 in the study is included below. The Tujunga Central Branch channel confluences with the Los Angeles River at approximately node F300 shown in in the figure.



Comment 5-Ib: Hydrology and Hydraulics

2. Under pre-Project (i.e., baseline) conditions, the volume of water flow from the Tujunga Central Branch channel into the 15-mile study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). LADWP should clearly define what it would consider to be above-average or below-average rainfall year.

Response to Comment 5-Ib

With respect to Changes to Hydrology and Hydraulics, the Los Angeles River Flows Project includes results from a comprehensive modelling effort that meets all the parameters in the comment. As noted on pages 7 through 9 of the study, estimated flow conditions were modeled using a coupled hydrologic-hydraulic model created in EPA's Storm Water Management Model (SWMM) and the Hydrology Engineering Center's River Analysis System (HEC-RAS). The hydrologic model simulates discharge on the mainstem of the LA River, Compton Creek, and Rio Hondo at an hourly time step from WY 2011 through 2017. The model includes wet season and dry season discharges and uses a dry period to represent conservative flow estimates as shown in the figure below taken from Figure 3 of the study.

The one-dimensional hydraulic model was created by combining existing HEC-RAS models for the LA River and updating channel geometry and Manning's roughness based on field observations and calibration. The hydraulic model was run under steady-state conditions, which were used to develop rating curves to apply to the simulated hydrographs, producing time series hydraulic data for velocity, maximum channel depth, and shear stress.

Some excerpts from the SCCWRP 2021 report that describes the Flows Project are included here:

> *"We estimated current flow condition in the study area using a coupled hydrologic-hydraulic model created in EPA SWMM and HEC-RAS (ES-2). Current hydrologic conditions are defined as the flows and operations that occurred during water year (WY) 2011 to 2017." (SCCWRP, 2021; p ii)*

"Calculated ranges for the wet season and dry season baseflow metrics increase downstream of the three water reclamation plants, illustrating the contributions of discharges from the water reclamation plants.... The wet season metrics, baseflows from the start of the storm season to the start of the dry season, and dry season metrics, base flows from the start of the dry season to the start of the following wet season, are calculated on an annual basis. Typically, the start of the wet season is between November to January and the start of the dry season is between May to July depending on the climatic conditions for a given water year. The broader ranges and higher values of wet season baseflow metrics reflects the contribution of residual stormdrain discharge following storm events. Rio Hondo and Compton Creek both have the lowest wet season and dry season baseflow magnitudes compared to all other reporting nodes on the mainstem." (SCCWRP, 2021; p iv.)

Comment 5-Ic: Hydrology and Hydraulics

3. Under proposed Project conditions, the percent reduction in flow from 1) the Tujunga Central Branch channel tributary and 2) 15-mile study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.

Response to Comment 5-Ic

As noted Figure ES-5 of the LA River Flows Project Final Report and excerpted below, dry weather storm flow contributions are a key consideration in the study. The graph illustrates average baseline flows with the black line accompanied by a grey band that indicates the 10 percent and 90 percent percentiles. This grey shading following the black line accounts for extremely dry years. In other words, the analysis represented by this graph takes dry year and wet year flows into consideration.

The graph compares potential future combined flow reductions of both dry weather runoff and WRP reductions with habitat value impacts. The large grey box represents habitat suitability for black willow habitat. The graph shows that a small percentage decline in dry weather storm channel flows (even in very dry years) would not reduce flows in the river below suitability thresholds for willow habitat, resulting in no reductions in habitat acreage or habitat quality. (The flow range for typha [cattails] is also included in the graph to show flow requirements for typha across the entire channel width. The flow rate is needed due to the wide channel width. Less flow could support typha within a narrower side channel such as shown in the HEC-RAS cross section provided in response to comment 5-!d below)As a result, the impact would be less than significant from a direct, indirect and cumulative perspective.

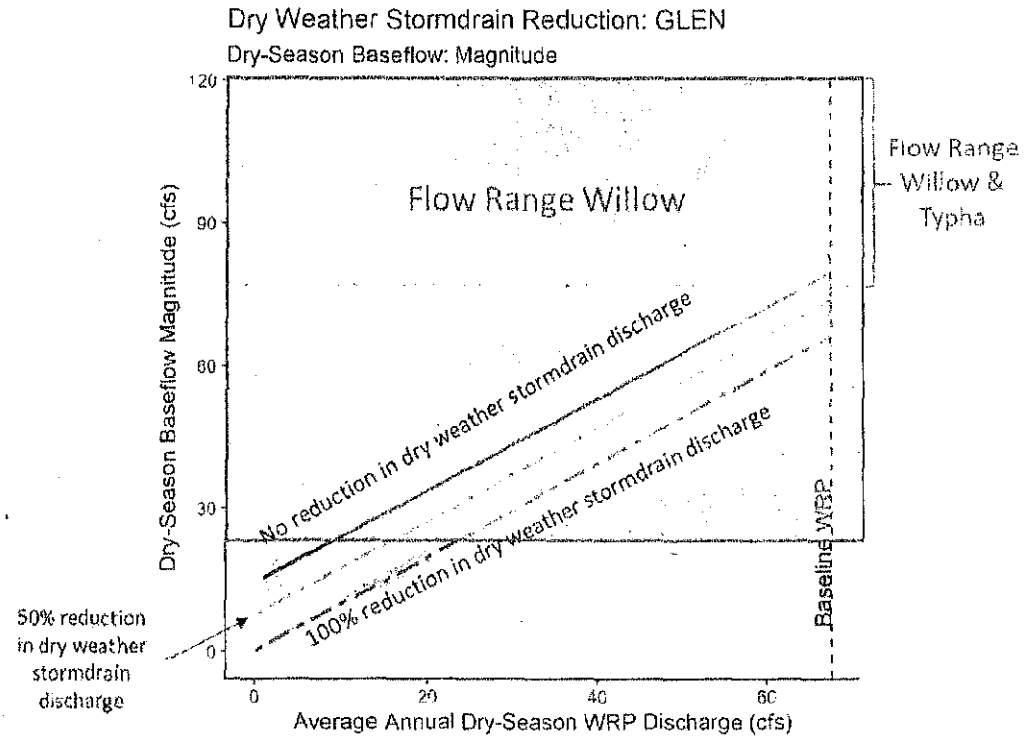


Figure ES-5. Flow-based sensitivity curves illustrating the combined effects of change in WRP discharge and 50% (yellow) and 100% reduction (red) in dry weather stormdrain discharge at GLEN reporting node. Solid and dashed lines represent median values; bounds of the gray and colored bands are the 10th and 90th percentile dry-season instream flows across the modeled period. Optimal flow range in this example is based on a 50% (medium) probability of occurrence of Willow and Typha.

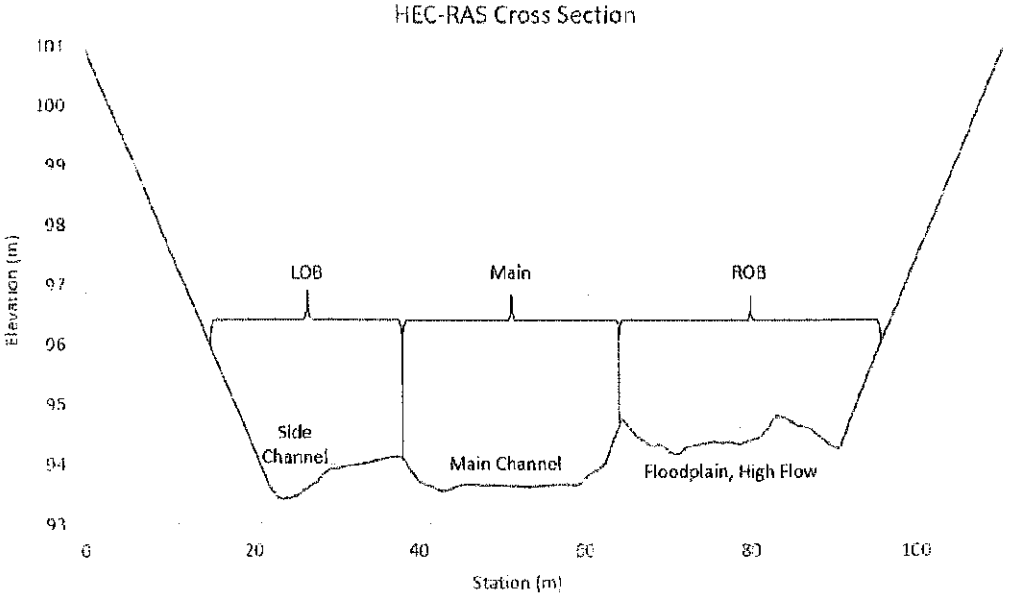
Comment 5-Id: Hydrology and Hydraulics



4. An analysis of potential Project-related changes to river hydraulics in both concrete and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change). CDFW requests a map modeling potential changes to channel hydraulics overlain on a map of plant communities and habitat for sensitive wildlife species and birds.

Response to Comment 5-Id

The Los Angeles River Flows Project published the "Assessment of Aquatic Life Use Needs for the Los Angeles River" (Assessment of Aquatic Life Report) in February 2021 (Stein, 2021). This document provides a detailed summary of hydraulic HEC-RAS modeling done to support the overall program objectives. Over 1,000 cross sections were generated by the HEC-RAS model in the river that show impacts of flow reductions to depth and wetted perimeter (as requested in the comment). Since the roughness of the Los Angeles river changes over time and greatly influences depth and wetted perimeter in specific locations, the model characterized typical channel dimensions and roughnesses to provide meaningful ecological-flow relationships. An excerpt from page 15 of this study is included below:

"Channel hydraulics (i.e., maximum channel depth, velocity, and shear stress) can vastly differ across different sections of the channel at a single site. For every soft-bottom output node in the HEC-RAS model, three output locations were selected at the three most significant morphological zones to capture the variability in hydraulics for each node and were designated as left overbank (LOB), center channel (Main), and right overbank (ROB)"

The figure below provided on page 15 of the Assessment of Aquatic Life Report shows how channel characteristics were accommodated in the ecological-flow relationship analysis provided in the report. Habitat suitability curves were developed to reflect water depth and velocity requirements of existing habitat within these three different parts of the channel: side channel, main channel, and high floodplain. Although the Assessment of Aquatic Life Report does not provide a map of the habitat within the Los Angeles River associated with each of these cross sections, it does inventory the species and habitat values that occur within the soft-bottom portion of the river (the 15-mile segment highlighted in the comment) and presents a detailed HEC-RAS model that provides depth and width impacts associated with flow reductions at specific cross section locations that were also measured in the field for model calibration purposes. The evaluation of habitat suitability within this segment of the river (see graph provided in response to comment 5-F) is then expressed in cubic feet per second (cfs) impacts rather than depth and width in order to provide a meaningful model for the total 15 miles of the soft-bottom segment.

Comment 5-Ie: Hydrology and Hydraulics

5. A quantitative analysis comparing the flow from the Tujunga Wash, Burbank Wastewater Reclamation Plant (WRP), Tillman WRP, Verdugo Wash, and Glendale WRP, and their relative contribution to the hydrograph of the 15-mile study reach.

Response to Comment 5-Ie

As described in responses above, the Assessment of Aquatic Life Report as well as the LA River Flows Project Final Report provide a comprehensive assessment of flow in the Los Angeles River including each of the flow sources noted in the comment. The Assessment of Aquatic Life Report describes average dry season river flows in each segment of the river accounting for contributions from WRPs, groundwater, and storm drain channel inputs.

Comment 5-If: Biological Resources Impact Assessment

1. A map of plant communities and important bird foraging and nesting habitat occurring in the 15-mile study reach. Plant communities should be mapped at the alliance/association level using the Manual of California Vegetation, second edition (Sawyer et al. 2009). Also, CDFW recommends an updated and thorough floristic-based assessment of plant communities, following CDFW's Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW 2018).

Response to Comment 5-If

The Assessment of Aquatic Life Report provides an inventory of habitat and species occurrences within the 15-mile segment mentioned in the comment. Figure 34 of the Assessment of Aquatic Life Report reproduced below illustrates which reaches exhibit aquatic and riparian habitat values. Habitat mapping was not conducted as part of the study. Rather, flow ranges supporting habitat suitability for all aquatic values were developed, assuming that the entire 15-mile river segment may exhibit habitat values.

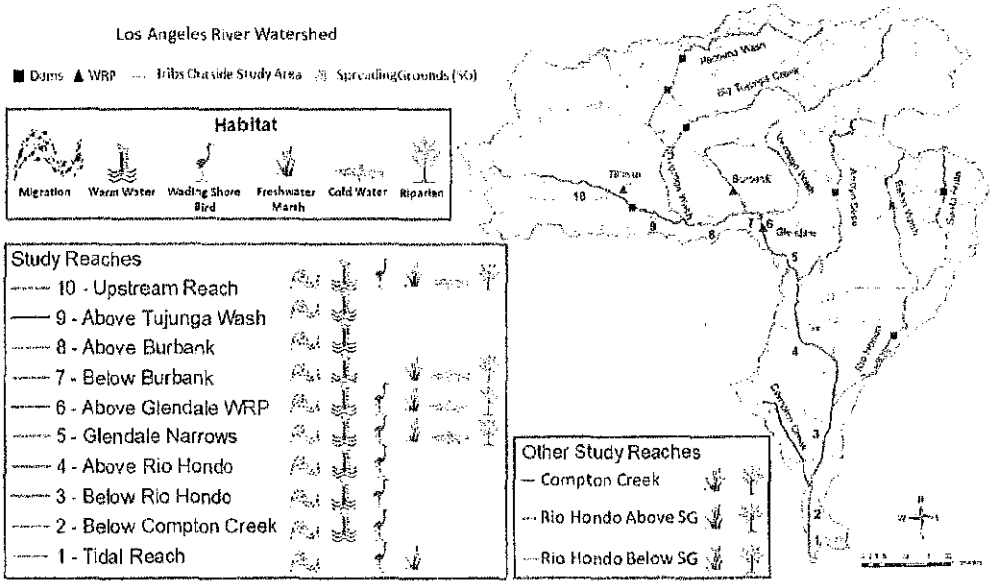


Figure 34. Map of study reaches with identified habitats that could potentially be supported in each reach.

Comment 5-Ig: Biological Resources Impact Assessment

2. A comprehensive list of sensitive and special status plant and wildlife species, and sensitive plant communities, occurring in the 15-mile study reach. CDFW recommends a nine-quad

search of the California Natural Diversity Database (CNDDB) for sensitive and special status biological resources that could occur downstream. For each biological resource, provide:

d. A summary of species-specific habitat requirements;

e. A discussion as to how the species or plant community may be significantly impacted directly or indirectly through habitat modification, as result of changes to hydrology (reduced flow) and hydraulics (water depth, wetted perimeter, velocity); and,

f. A quantitative analysis and/or adequate discussion to evaluate whether the Project would result in those significant impacts.

Response to Comment 5-Ig

The Los Angeles River Flows Project Final Report includes a comprehensive inventory and assessment of biological habitat values in the Los Angeles River:

> *"The overarching goal of this project is to consider potential effects of reduced WRP discharge and increased stormwater capture on existing and potential future beneficial uses. Therefore, our analysis included characterizing species and habitats that current occur and those that could reasonably occur in the future (based on a comparison to similar southern California watersheds). "(SCCWRP, 2021; p vii)*

> *"The aquatic life use assessment began with a compilation of observational data from the LA River and surrounding watersheds which was used to identify priority focal habitats and endmember species that represent a range of tolerances for each habitat. We then determined the flow conditions necessary to support the life history needs of each species and used those to create "flow-ecology" curves or models relating key hydrologic, hydraulic, and temperature conditions to the probability of occurrence for each focal species, or the probably of being able to complete specific life-history requirements." (SCCWRP, 2021; p vii)*

The Assessment of Aquatic Life Report provides the CNDDB listed species of concern in a concise map excerpted below. Beginning on page 38, the Assessment of Aquatic Life Report provides a summary of "life history needs" for key species within the habitat types. Habitat suitability curves are prepared based on the target vegetation's needs for water as measured by flow in the river (ie., cfs). This analysis defines future water flow reductions as the impact, and provides suitability curves to evaluate significance of the impact. The graph included in response to comment 5-F summarizes the relationship of flow in the river with habitat suitability for willow habitat. Since willow habitat (the key indicator species for riparian values in Southern California) is sustained with substantially less flow than currently exists or is projected to exist with future flow reductions, the contribution of 4 percent flow reduction resulting from the proposed project is considered cumulatively less than significant. That is to say, the scientific analysis contained in the LA Rivers Flows Project Final Report and companion study Assessment of Aquatic Life Report provide the information requested in this comment and support the conclusions of the IS/MND.

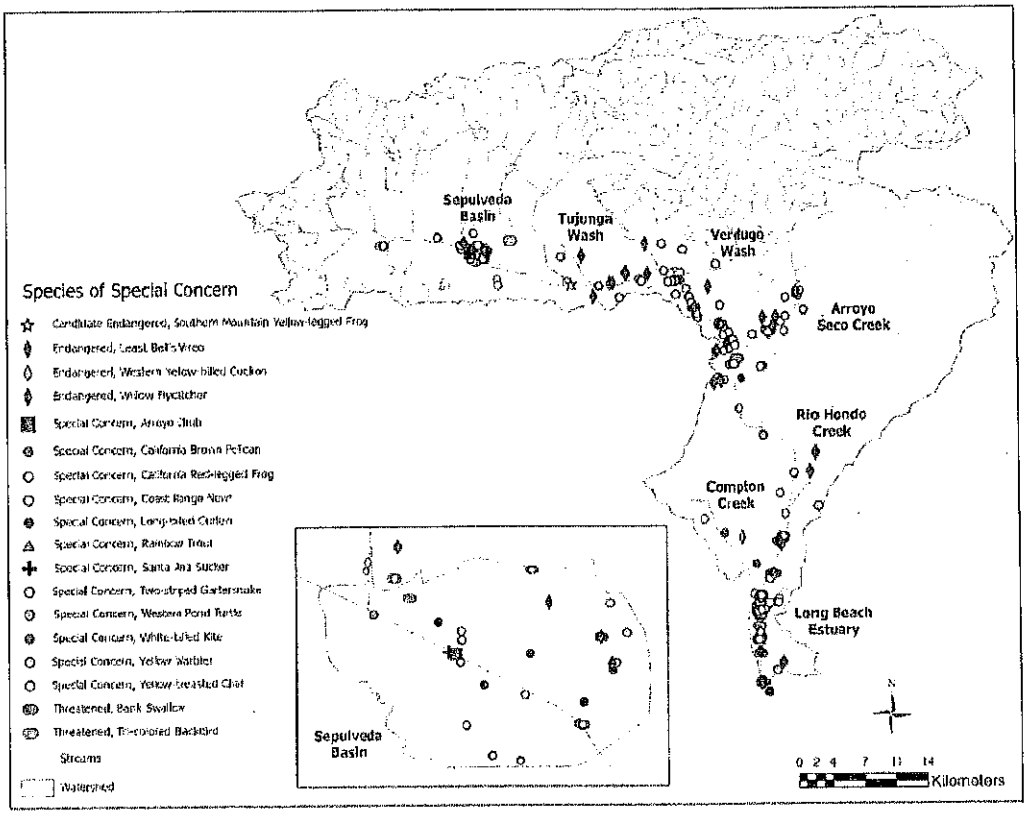

Figure 33. Species observations along the mainstem of the LA River and tributaries included in this study.

Comment 5-Ii: Biological Resources Impact Assessment

3. A discussion of whether diversion devices such as rubber dams would have direct and/or indirect impact on biological resources.

Response to Comment 5-Ii

As described on page 74 of the IS/MND, the proposed diversion structures would not impact any biological resources since they would be installed within either underground storm drain pipes or concrete box channels. The only effect to biological resources that could occur would result from reduced flow to downstream resources. No habitat would be removed as a result of the Project. As described in detail in this response to comment 5-I those effects are determined to be less than significant.

Comment 5-Ij: Biological Resources Impact Assessment

4. An adequate discussion to address how the Project may potentially affect on-going habitat recovery and restoration efforts.

Response to Comment 5-Ij

As described in this response to comment 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. No restoration projects are currently occurring within the river channel that would be adversely affected by the proposed Project.

Comment 5-Ik: Biological Resources Impact Assessment

5. An adequate discussion of Project-related impacts on biological resources in relation to cumulative flow reductions.

Response to Comment 5-Ik

As described in responses to comments 5-F and 5-I, the proposed Project would not significantly affect the habitat values within the Los Angeles River. The LA Flows Project Final Report provides ecology-flow relationship analysis for cumulative reductions including incremental storm flow and WRP reductions. The Project would not contribute to a cumulative reduction in habitat acreage or quality.

Comment 5-J

Mitigation Measure #2: CDFW recommends LADWP develop a discharge operation plan that would always allow sufficient water to pass downstream. CDFW also recommends LADWP develop an Adaptive Management Plan that would direct LADWP to reduce or suspend water diversion if at any point the Project may impact biological resources downstream exceeding a defined threshold/trigger.

Response 5-J

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. Downstream ecological values would not be measurably affected by the Project. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

LADWP recognizes that the placement of diversion structures within streams and drainages must comply with Fish and Game Code Section 5901 which prohibits installing "any device or contrivance that prevents, impedes, or tends to prevent or impede, the passing of fish up and down stream." Fish and Game Code 5937 requires that operators of dams "allow sufficient water to pass over, around or through the dam, to keep in good condition any fish that may be planted or exist below the dam." Currently, no fish exist within the underground urban storm collection system or concrete box channel. The Tujunga Central Branch channel does not lead to natural stream resources at higher elevation. As a result, the channel would not provide a migratory route for steelhead spawning grounds now or in the future. The entire watershed area is urbanized, mostly within underground storm drain pipes with no ecological values. Future fish migration in the channel is highly unlikely. Furthermore, the instream diversion structures have been designed and operated to allow for storm flows to bypass the diversion mechanism. Each of the diversion

structures would include a slide gate. If fish re-colonized the channel in the future these slide gates would be able to allow bypass flows. Therefore, based on the ability to allow for storm flows, the diversion structures would also be able to accommodate fish passage during periods of receding flow when migration opportunities exist, if fish were present. The project would not prevent future habitat restoration or fish occupation in the drainage. The proposed designs would be compliant with California Fish and Game Code 5901 and 5937. Since no fish are currently in the concrete channel and dry weather flow depths do not accommodate ponding sufficient for fish to survive, there is no reason to prepare a discharge operation plan or adaptive management plan at this time.

See responses to comments 5-G and 5-I.

Comment 5-K

Mitigation Measure #3: CDFW recommends LADWP provide compensatory mitigation at no less than 3:1 for permanent impacts to the concrete-lined Tujunga Central Branch channel due to the installation of diversion structures including (but not limited to) rubber dams and channel drop inlets. CDFW also recommends LADWP provide compensatory mitigation commensurate with the permanent diversion of discharge from Los Angeles River.

Response 5-K

The IS/MND concludes that based on the evidence provided in the existing literature, the proposed Program would not result in significant impacts to biological resources in the Los Angeles River considering the small contribution of flow provided by the Tujunga Central Branch channel. The IS/MND concludes that since the Program's effects would not result in a significant impact directly or cumulatively, no mitigation is required.

The purpose of compensatory mitigation for impacts to waters of the State is to ensure that habitat values and hydrologic functions are maintained at least at the level of the system prior to the initiation of the project. The current concrete channel into which the diversion structures will be placed currently provides no habitat value. Six of the diversion structures will be placed in underground reinforced concrete pipe. The City does not believe that compensation is required for placing diversion structures in underground concrete pipes or concrete channels. As noted on page 74 of the Draft IS/MND, the City will be required to obtain a Lake and Streambed Alteration Agreement (LSAA) from CDFW for the three park projects that will place diversion structures within concrete channels. See response to comment 5-N.

Comment 5-L

Recommendation #1: CDFW recommends the following data and information sources:

- Stream gage data available from Los Angeles County Public Works (LADPW 2021);
- Los Angeles River Master Plan (Geosyntec et al. 2020); and,
- Los Angeles River Flows Project (SWRCB 2019).

Response 5-L

The IS/MND (on page 74) includes annual flow estimates for the Los Angeles River provided by USACE. The data provided in the Draft IS/MND regarding flows is consistent with the river flow data provided in the references cited in the comment. The City is participating in the Los Angeles River Flows Project which has compiled hydrologic and hydraulic data for the river. The data mentioned in the comment from the County are continuously collected and are indicative of the flow data used by the USACE to ensure flood protection for the City of Los Angeles. The recently published Los Angeles River Master Plan compiles historic river flow data consistent with the USACE and County data. All of this data is consistent with the annual flow totals cited in the IS/MND that document the percentage of flow from the Tujunga Central Branch channel. See response to comments 5-C and 5-G.

Comment 5-M

Recommendation #2: Based on the inadequacy of the Draft IS/MND as elaborated in our preceding comments, CDFW recommends that LADWP revise and recirculate the Draft IS/MND so CDFW may provide more appropriate comments on avoidance, minimization, and mitigation measures (CEQA Guidelines, § 15073.5).

Response 5-M

The comment provides no new information supporting the inadequacy of the analysis in the Draft IS/MND. Re-circulation of the Draft IS/MND is not necessary since existing evidence supports a conclusion that impacts would be less than significant, and that it would be unreasonable to assume otherwise. Furthermore, the study recently published by SCCWRP (SCCWRP 2021b) provides all of the hydrology and hydraulics data and analysis requested in the comment. The study substantiates the conclusions made in the Draft IS/MND, and satisfies CDFW's request for additional information.

Comment 5-N

The Project would potentially alter streams. The Project would divert dry season flow and stormwater. In addition, the Project proposes to install devices within and adjacent to a stream to facilitate water diversion.

The Project would divert water from the Tujunga Central Branch channel and Los Angeles River. The Project proposes to install water diversion structures within or adjacent to the Tujunga Central Branch channel. This includes inflatable rubber dams. Accordingly, the Project may obstruct water flow and change the bed and channel of a stream (confinement).

Fish and Game Code section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake;

- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or,
- Deposit or dispose of material into any river, stream, or lake.

Response 5-N

The Draft IS/MND states on page 74 that the City would be required to obtain a Streambed Alteration Agreement pursuant to the California Fish and Game Code section 1602. The City will consult with CDFW to obtain a 1602 LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel. Installation of diversion structures into underground storm drain pipes may require notification, but would not likely result in the need for a full LSAA. The table below identifies LADWP's assumptions of which Program sites may require a LSAA LADWP understands that CDFW will ultimately determine which of these sites will require a LSAA based on information in the initial notification.

Infiltration Gallery Location	Diversion Structure Installation	LSAA Required?
David M. Gonzales Recreation Center	Underground Storm Drain Pipe	No
FernAngeles Park	Underground Storm Drain Pipe	No
Whitsett Fields Park North	Underground Storm Drain Pipe	No
Strathern Park North	Underground Storm Drain Pipe	No
Valley Plaza Park North	Underground Reinforced Concrete Box Culvert	No
Valley Plaza Park South	Concrete Channel	Yes
Alexandria Park	Concrete Channel	Yes
North Hollywood Park	Concrete Channel	Yes
Valley Village Park	Underground Storm Drain Pipe	No

Comment 5-O

Mitigation Measure #1: CDFW has concluded that the [Program] may result in the alteration of streams. As such, the applicant (or "entity") must provide notification to CDFW pursuant to Fish and Game Code, section 1600 *et seq*. Based on this notification and other information, CDFW determines whether an LSAA with the applicant is required prior to conducting the proposed activities. Please visit CDFW's Lake and Streambed Alteration Program webpage to for information about LSAA Notification and online submittal through the Environmental Permit Information Management System Permitting Portal (CDFW 2021a).

Response 5-O

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602. A new mitigation measure requiring compliance with regulations is not needed. The City will consult with CDFW to obtain a 1602

LSAA for the Program sites that include construction of diversions structures at the Tujunga Central Branch channel (see table in response 5-N).

Comment 5-P

Mitigation Measure #2: CDFW recommends the LSAA Notification include a hydrological evaluation of the 200, 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions.

Recommendation: CDFW's issuance of an LSAA for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from LADWP for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 *et seq.* and/or under CEQA, the CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSAA. As such, CDFW recommends LADWP consider CDFW's comments and revise the Draft IS/MND. To compensate for any on- and off-site impacts to aquatic and riparian resources, additional mitigation conditioned in any LSAA may include the following: erosion and pollution control measures, avoidance of resources, protective measures for downstream resources, on and/or off-site habitat creation, enhancement or restoration, and/or protection, and management of mitigation lands in perpetuity.

Response 5-P

The Draft IS/MND states on page 74 that the City would be required to obtain a LSAA pursuant to the California Fish and Game Code section 1602(See response to comment 5-N). Hydrologic assessments have been conducted for each of these park projects to determine the capacity of the infiltration galleries and the quantity of feasible wet weather diversions. The rubber dam diversion structures would be lowered when flow rates exceeded the diversion capacity, allowing most of the storm flows in larger storms (including the 2, 5, 10, 25, 50, 100, and 200 year storms) to bypass the diversions. Additional modeling is not necessary to make this conclusion.

Comment 5-Q

CDFW is concerned that the Program may result in significant impacts to bats, including hoary bat (*Lasiurus cinereus*) and silver haired bat (*Lasionycteris Octavian's*).

The Program may result in direct and indirect impacts to bats. Direct impacts include removal of trees and that may provide roosting habitat. Indirect impacts to bats and roosts could result from increased human activity, noise disturbances, dust, vegetation clearing, ground-disturbing activities (e.g., staging, mobilizing, excavating, and grading), and vibrations caused by heavy equipment.

Native and non-native ornamental trees at each park could provide potential roosting habitat for bats. Bats can fit into very small seams, as small as a ¼ inch. Therefore, crevices in buildings and

other man-made structures within and adjacent to each park could provide roosting habitat for bats. Despite the availability of potential roosting habitat, the Program concludes that there would not be significant impacts to bats.

Page 60 of Appendix B concludes that while bats "may use western sycamore trees to roost, special-status bat species including hoary bat and silver-haired bat have low potential to occur within all of the project locations, since they are situated in an urban environment with constant ambient nighttime lighting (e.g., street lights, baseball field lights)." The presence of constant ambient lighting may be insufficient to conclude that bats do not occur. Bat response to artificial lighting could vary between species and not all bat species are repelled by light (Longcore and Rich 2004; Opéra et al. 2009). Faster-flying species of bats are attracted to insects that congregate around light sources (Longcore and Rich 2004). Foraging is still possible in the presence of ambient lighting, although forging may be reduced. Also, based on Program site photos in Appendix B, it appears that not all areas within certain parks are illuminated, for instance Valley Plaza North and Valley Plaza South. Based on the above, the probability of bats occurring within each park could be higher than previously concluded.

Accordingly, if bats are present, extra noise, vibration, or the reconfiguration of large objects can lead to the disturbance of roosting bats. Human disturbance can also lead to a change in humidity, temperatures, or the approach to a roost that could force the animals to change their mode of egress and/or ingress to a roost. Modifications to roost sites can have significant impacts on the bats' usability of the roost and can impact the bats' fitness and survivability (Johnston et al. 2004). Although temporary, such disturbances can lead to the abandonment of a maternity roost (Johnston et al. 2004).

Response 5-Q

The Draft IS/MND identifies on page 73 that removal of trees may affect wildlife commonly found in the parks, including bat species, although the Draft IS/MND concludes that the potential for encountering bat roosts in the affected trees is low. Nonetheless, in response to this comment, Mitigation Measure BIO-1 has been modified to require that bat surveys be conducted at each of the Program sites to ascertain whether bats are utilizing the trees to be removed by the Program. With this modification to the BIO-1 mitigation measure, impacts to bats would remain less than significant.

The following text is added to Mitigation Measure BIO-1:

- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with

CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

Comment 5-R

Bats are considered non-game mammals and are afforded protection by State law from take and/or harassment (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). Additionally, several bat species are considered Species of Special Concern and meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Take of SSC could require a mandatory finding of significance by the Lead Agency (CEQA Guidelines, § 15065).

Response 5-R

See response to comment 5-Q.

Comment 5-S

Mitigation Measure #1: Where Program-related implementation, construction, and activities would occur near potential roosting habitat for bats, CDFW recommends a qualified bat specialist conduct bat surveys within these areas (plus a 100-foot buffer as access allows) in order to identify potential habitat that could provide daytime and/or nighttime roost sites, and any maternity roosts. CDFW recommends using acoustic recognition technology to maximize detection of bats. A discussion of survey results, including negative findings should be provided to LADWP. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the LADWP prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.

Response 5-S

Mitigation Measure BIO-1 has been modified to accommodate CDFW suggested mitigation requirements. See response to comment 5-Q.

Comment 5-T

Mitigation Measure #2: If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed down using heavy machinery rather than felling with a chainsaw. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. The tree should then be pushed to the ground slowly and remain in place until it is inspected by a bat specialist. Trees that are known to be bat roosts should not be bucked or mulched immediately. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape.

Response 5-T

Mitigation Measure BIO-1 provides for bat surveys to confirm that bats are not using the trees. If bats are encountered the City will consult with CDFW to ensure an effective bat removal effort in compliance with the California Fish and Game Code. Bats will not be removed from the Program sites without prior CDFW approval. No additional tree removal techniques would be required. No new mitigation is required.

Comment 5-U

Mitigation Measure #3: If maternity roosts are found, to the extent feasible, work should be scheduled between October 1 and February 28, outside of the maternity roosting season when young bats are present but are yet ready to fly out of the roost (March 1 to September 30).

Response 5-U

Mitigation measure BIO-1 has been modified to require approval from CDFW if bats are found to be using the affected trees. As part of any bat removal effort that may be necessary, seasonality of the removal will be a consideration. No additional mitigation measure is required.

Comment 5-V

Mitigation Measure #4: If maternity roosts are found and LADWP determines that impacts are unavoidable, a qualified bat specialist should conduct a preconstruction survey to identify those trees proposed for disturbance that could provide hibernacula or nursery colony roosting habitat. Acoustic recognition technology should be used to maximize the detection of bats. Each tree identified as potentially supporting an active maternity roost should be closely inspected by the bat specialist no more than 7 days prior to tree disturbance to determine the presence or absence of roost bats more precisely. If maternity roosts are detected, trees determined to be maternity roosts should be left in place until the end of the maternity season. Work should not occur within 100 feet of or directly under or adjacent to an active roost. Work should also not occur between 30 minutes before subset and 30 minutes after sunrise.

Response 5-V

As noted in response to comment 5-Q, mitigation measure BIO-1 has been modified to include bat presence surveys. If bats are found, the mitigation measure would require that the City implement a bat removal program in consultation with CDFW.

Comment 5-W

Devices Impeding Fish. The Program includes installation of rubber dams in the stream channel. Per California Fish and Game Code section 5901, it is unlawful to construct or maintain in any stream any device or contrivance the prevents, impedes, or tends to prevent or impeded, the passing of fish up and downstream. Accordingly, LADWP should coordinate with CDFW prior to commencing the Program to ensure that the Program would comply with Fish and Game Code section 5901.

Response 5-W

The concrete pipeline and channel do not support fish species. The Program would not install any devices that would impede fish migration since fish do not occur in the concrete channel and underground pipeline associated with the Tujunga Central Branch channel. The primary impediment for migrating fish under existing conditions is the velocity of the fast-moving storm water in confined pipelines and channels and the lack of refugia habitat at the channel edges. Nonetheless, the in-channel devices for four of the Program sites will require an LSAA from CDFW. The City will consult with CDFW to ensure diversion structures are compliant with Fish and Game Code section 5901.

Comment 5-X

Southern California Black Walnut Tree (*Juglans californica*). According to page 73 in the Draft IS/MND, one Southern California black walnut tree may be removed at North Hollywood Park. Southern California black walnut is a California Rare Plant Rank 4.2 species. If removal of Southern California black walnut is required, CDFW recommends LADWP replace each tree at no less than 3:1 in consideration of the species rarity, temporal loss of black walnut tree canopy and structure while the tree grows, and potential attrition associated with transplanting. Southern California black walnut trees should be replaced with trees of the same species.

Response 5-X

As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced with 24-inch box size specimens of the same tree species at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy.

Comment 5-Y

Tree Replacement. In the greater Los Angeles, urban forests and street trees, both native and some non-native species, provide habitat for a high diversity of birds (Wood and Esaian 2020). Some species of raptors have adapted to and exploited urban areas for breeding and nesting (Cooper et al. 2020). For example, raptors (Accipitridae, Falconidae) such as red-tailed hawks (*Buteo jamaicensis*) and Cooper's hawks (*Accipiter cooperii*) can nest successfully in urban sites. Red-tailed hawks commonly nest in ornamental vegetation such as eucalyptus (Cooper et al. 2020). CDFW recommends planting native tree species preferred by birds. This includes coast live oak (*Quercus agrifolia*) and California sycamore (*Platanus racemosa*) (Wood and Esaian 2020). CDFW recommends Audubon Society's Plants for Birds for more information (Audubon Society 2020).

Response 5-Y

The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. As noted on pages 78-80 of the Draft IS/MND, any protected tree required to be removed would be replaced

with 24-inch box size specimens at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings. Mitigation Measure BIO-1 is included in the Draft IS/MND to ensure construction activities do not disturb nesting birds. The requirement to replace mature trees would encourage future nesting opportunities for raptors.

Comment 5-Z

Landscaping. CDFW strongly recommends avoiding non-native, invasive plants. CDFW recommends LADWP restrict use of any species, particularly 'Moderate' or 'High' listed by the California Invasive Plant Council (Cal-IPC 2020a). CDFW recommends LADWP use native species found in naturally occurring vegetation communities within or adjacent to the Program sites. Information on alternatives for invasive, non-native, or landscaping plants may be found on the California Invasive Plant Council's, Don't Plant a Pest webpage for southern California (CalIPC 2020b). The California Native Plant Society's Gardening and Xerces Society's PollinatorFriendly Native Plant Lists webpage has information on native plant species that invite insects and pollinators (CNPS 2020; Xerces Society 2020).

Response 5-Z

As noted in the project description, each of the Program sites will be re-landscaped following the installation of the stormwater capture infrastructure. The landscaping plans will use primarily native species to the extent feasible, per RAP landscaping guidelines.

Comment 5-AA

Move Out of Harm's Way. The proposed Program is anticipated to result in clearing of habitats that support wildlife species common in developed areas. CDFW recommends a qualified biological monitor be on site during initial ground disturbing activities and vegetation removal. The qualified biological monitor should move wildlife of low mobility out of harm's way to avoid wildlife injury or mortality.

Response 5-AA

Mitigation Measure BIO-1 would ensure that impacts to any avian species currently utilizing the Program sites would be avoided. As required in mitigation measure BIO-1, contractors will be encouraged to remove vegetation outside of the affected avian or bat nesting seasons. If nesting season cannot be avoided, the mitigation measure provides for measures to ensure impacts to nesting birds is avoided, including delaying activities if necessary. Since the Program sites do not support any native habitat values, a biological monitor is not recommended other than for nesting birds as required in mitigation measure BIO-1.

Comment 5-AB

Data. CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database (i.e., California Natural Diversity Database) which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDB Field Survey Forms (CDFW 2020b). LADWP should ensure the data has been properly submitted, with all data fields applicable filled out, prior to finalizing/adopting the environmental document. LADWP should provide CDFW with confirmation of data submittal.

Response 5-AB

The City acknowledges that survey data identifying special status species should be provided to the CDFW. Appendix B of the Draft IS/MND includes a Biological Technical Report prepared for the Program.

Comment 5-AC

Mitigation and Monitoring Reporting Plan. CDFW recommends LADWP update the Program's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist LADWP in developing mitigation measures that are specific, detailed (i.e., responsible party, timing, specific actions, location), and clear in order for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). LADWP is welcome to coordinate with CDFW to further review and refine the Program's mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided LADWP with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).

Response 5-AC

The City will adopt the MMRP when approving the Final IS/MND that will include implementation of Mitigation Measure BIO-1.

Comment 5-AD

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by LADWP and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

Response 5-AD

The City recognizes that the CDFW filing fee for this IS/MND is applicable and the appropriate funds will be included with the Notice of Determination (NOD) when filed with the County Clerk as required by the CEQA Guidelines Section 15094.

Comment 5-AE

The comment includes a table with all of the CDFW proposed Mitigation Measures outlined in the letter.

Response 5-AE

As discussed in the responses to comments 5-A through 5-AE, no new mitigation measures are needed to ensure less than significant effects to biological resources. The MMRP will include the modified Mitigation Measure BIO-1 that reflects CDFW's comments on bat species.

Letter 6: Diana Nicole (Sunshine Hills Residents Association)

Comment 6-A

The commenter expresses concern regarding the diversion of City plans, codes, and funds from parks and tree-oriented initiatives toward green infrastructure.

Response 6-A

The comment does not state a specific concern about the adequacy of the Draft IS/MND or otherwise comment on the contents of the Draft IS/MND analysis. The comment is noted and will be included in the Program record, but a response is not required pursuant to CEQA.

Comment 6-B

The commenter expresses concern regarding the depletion of existing trees/urban forest resources as a result of the Program.

Response 6-B

Once the stormwater capture infiltration galleries are installed, the Program sites will be returned to preconstruction condition with park improvements. The park improvements will include but are not limited to, the addition of green infrastructure elements such as landscape areas with California native drought-tolerant plant material, new irrigation system, shade trees, new lighting. The proposed Program would require the removal of existing trees; however, the removal of trees would be replaced on a trunk caliper size basis, 1-inch replaced to 1-inch removed. Any protected tree required to be removed would be replaced with 24-inch box trees at a ratio of 4:1 in accordance with the City's Tree Protection Ordinance (No.177404) and the RAP's Tree Preservation Policy. The replacement trees would be planted near the original tree's location, but if there is not adequate space, the City would coordinate with RAP to identify the closest appropriate locations for new plantings.

Comment 6-C

The commenter states that the City's protected trees, groves, and related habitat should be subject to higher conservation standards than those that are provided in the Draft IS/MND.

Response 6-C

The City would comply with the existing tree ordinance. See response to 6-B above.

Letter 7: County of Los Angeles Fire Department

Comment 7-A

The commenter provides introduction of the County of Los Angeles Fire Department.

Response 7-A

The comment is noted and will be included in the Program record.

Comment 7-B

The commenter states that since the Program is within the City, the Program would not impact the County of Los Angeles Fire Department.

Response 7-B

The comment is noted and will be included in the Program record.

Comment 7-C

The commenter states that the Program would not have an impact on the County Fire Department Land Development Unit.

Response 7-C

The comment is noted and will be included in the Program record.

Comment 7-D

The comment states that under the Los Angeles County Oak Tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the Oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured 4 1/2 feet above mean natural grade.

Response 7-D

The Draft IS/MND describes the Oak Tree Ordinance in detail on pages 78-81. The Draft IS/MND concludes that compliance with the ordinance and RAP's Tree Preservation Policy would ensure that impacts to mature trees would not result in significant impacts.

Comment 7-E

The commenter states that the Program would not impact the Health Hazardous Materials Division.

Response 7-E

The comment is noted and will be included in the project record.

Letter 8: Joanne D'Antonio

Comment 8-A

The commenter raises objection to the proposed removal of any mature and healthy trees, most notably the eucalyptus grove at North Hollywood Park. The commenter states that this park has experienced great tree loss during the drought and that all parks are important for the physical and psychological health of residents. They provide much needed shade in the heat-island-effect-plagued San Fernando Valley. The commenters asks where the wildlife will go during construction and how disruptive construction noise may be.

Commenter would like to see the project redesigned to not remove any trees and references several reports on biodiversity and the loss of trees and tree canopy by the City of Los Angeles and Tree People.

Response 8-A

All nine project sites are currently located within developed City parks containing active recreational facilities or open disturbed areas. All nine park project sites will undergo some enhancements and improvements to the park aesthetic and recreational facilities after the installation of the projects. As stated in the IS/MND page 7, park enhancements and improvements are being designed with input from RAP and the community. The City has been coordinating the design effort with RAP and has engaged the local community through several community meetings to solicit input. Conceptual design drawings were included in the IS/MND as Figures 1-4 through 1-12 to depict the current preliminary design associated with each park project site. The stormwater capture facilities are mainly being placed beneath existing ball fields, where feasible, to minimize impacts to landscaped areas within the park. The designs for each park attempt to minimize tree removal where feasible, but as stated in section 2.4, Biological Resources, some trees will be removed in compliance with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees. The City has been in coordination with the RAP Forestry Division and none of the parks' mature or healthy trees will be removed without their approval. Revisions to the park designs are being made in coordination with RAP in order to preserve mature trees and any other trees deemed sacred by RAP. RAP has identified two eucalyptus trees at North Hollywood Park that have died and have requested these be removed as part of the project. Tree surveys will be conducted at each part project site prior to tree removal to determine which trees are protected and which trees would need replacement under the RAP Tree Preservation Policy. Further, Mitigation Measure BIO-1was included to protect wildlife species from impacts during

construction. This mitigation measure will require construction activities to occur outside of the nesting bird season or to avoid or minimize impacts to nesting birds and raptors by requiring preconstruction surveys and nest avoidance and/or monitoring during construction.

The City acknowledges that the City of Los Angeles is considered a biodiversity hotspot. As stated in the 2020 Biodiversity Report prepared by the City of Los Angeles and referenced by the commenter, the Program area would fall primarily within Ecotope 20: Los Angeles River Alluvial Plain. As shown in Appendix B, page 428 of the report, only 0.5 percent of the natural vegetation remains across the ecotope, mostly within the Sepulveda Basin. Riparian vegetation is the dominant remaining type of vegetation and provides nesting habitat for the federally endangered least Bell's vireo (*Vireo bellii pusillus*) and potentially the southwestern willow flycatcher (*Empidonax traillii extimus*). The Program site does not include riparian vegetation and is located in an area that is surrounded by a vegetation alliance characterized by urban/developed, and falls mostly within areas characterized by non-native alliances. In addition, the program site is not located within an area characterized as a natural area by the study, and it is located within areas with higher pollution and population percentiles and a lower habitat quality score due to the urban nature of its location. (City of Los Angeles 2020, pages 436 through 442) As such, although the City of Los Angeles is rich in biodiversity, construction within the Program area would not add to the decline of biodiversity in the area.

Comment 8-B

The commenter requests that all trees in the vicinity of construction be protected with orange fencing and no construction material placed under the drip line.

Response 8-B

The construction impact areas will be clearly delineated and trees to be retained will be clearly marked to avoid any impacts to them. As stated in Response 8-A, the City will comply with the City of Los Angeles Tree Protection Ordinance and the RAP Tree Preservation Policy for protection of native and non-native trees that are being retained onsite and/or are being removed.

The RAP Tree Preservation Policy is the primary regulatory tool that gives direction for orderly protection of specified trees, maintains their value, and avoids significant negative effects to the ecosystem. By assuring preservation and protection through regulation and standards of care, these resources will remain significant contributions to the environment and landscape, and continue to add to the unique character of Los Angeles City Parks. (RAP 2004).

As outlined in the Policies for the Installation and Preservation of Landscaping Trees on Public Property of Recreation and Parks Department, included as Appendix M of the City of Los Angeles RAP Urban Forest Program (RAP 2004), "whenever trees are removed, the existing trees' aggregate diameter, measured at breast height (DBH [diameter at breast height], or 4.5-feet above the ground; multi-trunk trees are to be measured immediately below the lowest trunk) shall be replaced at an equal or greater rate of caliper of new trees. Each one-inch DBH of existing tree shall be replaced with a minimum one-inch caliper new tree." For example, if an existing tree with a DBH of 24 inches is removed, the City would need to replace that tree with a newly

planted trees with a total DBH of 24 inches. The replacement tree can have a DBH of 24 inches or if smaller trees are planted, with a DBH of 2 inches, then 12 trees would be planted, or any combination that equates to the 24-inch DBH being replaced.

Comment 8-C

The commenter is concerned about imported soil and improper soil being substituted for naturally occurring soil which create the best environment for replanting. The commenter asks if there is a plan for replanting at the parks to be done with viable new trees. The commenter states that ideally construction projects such as these would not be happening in our parks.

Response 8-C

As stated on page 38 of the IS/MND, once installation of the stormwater system is complete, soils excavated from the site that are stockpiled on-site would be used to backfill the impact areas. Additional imported soils would be used to regrade as needed to return the project impact areas to pre-project conditions. The City will ensure that the soil to backfill the impacted areas would be suitable for the required design elements as shown on preliminary Figures 1-4 through 1-12 of the IS/MND including landscape planting. The City is coordinating with RAP to ensure compliance with park requirements.

Comment 8-D

The commenter states that a one-month comment period is too short to get input from neighborhood councils.

Response 8-D

The comment is noted and will be included in the project record. The CEQA Guidelines require that MNDs be circulated for a total of 30 days per Section 15105(b).

4.2 Changes Made to the Draft IS/MND

The City has made the following changes to the Draft IS/MND and has incorporated them into the Final IS/MND. These modifications clarify, amplify, or make minor changes to the Draft IS/MND. Revisions to the Draft IS/MND have not resulted in new significant impacts or increased the severity of an impact.

Where the responses indicate additions or deletions to the text of the Draft IS/MND, additions are included as <u>underlined text</u>, deletions as ~~stricken text~~. The changes are listed by section and page number.

4.2.1 Changes Made in Response to Comments

Clarification/Revision

The following modifications have been made to page 75 of the Draft IS/MND to augment Mitigation Measure BIO-1 for the inclusion of bat surveys.

Section 2.4, Biological Resources – Page 75

Mitigation Measure

BIO-1: Special-Status Wildlife Species. Construction activities at any of the nine park project sites could result in impacts to the Cooper's hawk *(Accipiter cooperii)*, a California Species of Special Concern, where mature trees are present. Similarly, construction activities may also impact other nesting bird species that may nest in a variety of vegetation as well as man-made structures. Construction activities should occur outside of the avian nesting season. If the avian nesting season cannot be avoided and construction or vegetation removal occurs from February 1 to September 1, the City ~~project~~ shall implement the following to avoid and minimize impacts to nesting birds and raptors:

- During the avian breeding season, a qualified biologist shall conduct a preconstruction avian nesting survey no more than 7 days prior to vegetation disturbance or ground-disturbing activities. If construction begins in the non-breeding season and proceeds continuously into the avian nesting season, no surveys are required. However, if there is a break of 7 days or more in construction activities during the nesting season, a new nesting bird survey shall be conducted before construction begins again.
- The preconstruction survey shall cover all reasonably potential nesting locations on and within 100 feet of the construction areas. A 300-foot radius shall be surveyed in areas containing suitable habitat for nesting raptors, such as trees and utility poles.
- If an active nest is found during the preconstruction avian nesting survey, a qualified biologist shall designate a suitable buffer for all passerine birds and raptor species. The nest site area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and the young will no longer be impacted by the project. Buffer areas may be increased upon recommendation of a qualified biologist if any endangered, threatened, California Fully Protected, or California Species of Special Concern are identified during preconstruction surveys.
- If the nest(s) are found in an area where ground disturbance is scheduled to occur, the City or its contractor shall avoid the area by delaying ground disturbance in the area until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.
- Prior to removal of trees in any of the Program sites, the City shall retain a qualified bat specialist to conduct bat surveys to confirm whether bats are using the trees as roosting sites. The surveys should encompass a minimum buffer area of 100 feet around the Program sites. The results of the surveys will be provided to CDFW. In the event that bat roosts are identified, an additional bat species survey will be conducted using acoustic survey techniques necessary to confirm the species of bat using the area. If the species survey concludes that sensitive bat species are present, the City shall consult with CDFW pursuant to the California Fish and Game Code section 2081. Removal of special status bats would not be conducted without prior approval from CDFW.

4.2.2 Changes Made by the Lead Agency

Clarification/Revision

The following modifications have been made to page 1 of the Draft IS/MND to include The Metropolitan Water District of Southern California (Metropolitan) as a Responsible Agency of the Program.

Section 1.0, Project Description – Page 1

1.1 Introduction

The City of Los Angeles Department of Water and Power (LADWP), Department of Public Works (Bureau of Engineering [BOE]), Los Angeles Sanitation and Environment (LASAN), and City of Los Angeles Department of Recreation and Parks (RAP), collectively referred to herein as the City, propose to implement the Stormwater Capture Parks Program (Program). The Program would include construction of stormwater capture facilities at nine City-owned parks to help capture surface flow and divert stormwater runoff from the Tujunga Wash Central Branch storm drain to recharge the San Fernando Groundwater Basin. All nine parks are located in the east San Fernando Valley along State Route (SR) 170 (**Figure 1-1**); these parks include: David M. Gonzales Recreation Center; Fernangeles Park; Strathern Park North; Whitsett Fields Park North; Valley Plaza Park North; Valley Plaza Park South; Alexandria Park; North Hollywood Park; and Valley Village Park (**Figure 1-2**).

The City is proposing to obtain financial assistance for the park projects through the Stormwater for Recharge Pilot Program (Recharge Pilot) that is administered by The Metropolitan Water District of Southern California (Metropolitan). The Recharge Pilot encourages development and monitoring of new and existing stormwater recharge projects by providing financial incentives for construction and/or monitoring equipment installation of project and supplemental reporting costs.

Metropolitan offers different incentive amounts for the Recharge Pilot based on project type (New Construction or Monitoring Equipment Installation):

<table>
<tr><td>PROJECT TYPE</td><td colspan="2">FUNDING COMPONENTS</td></tr>
<tr><td></td><td>Construction/Installation</td><td>Monitoring & Reporting</td></tr>
<tr><td rowspan="2">Monitoring Equipment Installation</td><td>Up to $350,000 reimbursement for eligible costs</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $500,000</td></tr>
<tr><td rowspan="2">New Construction</td><td>Up to 50% reimbursement of eligible costs, max of $850,000</td><td>$50,000/report</td></tr>
<tr><td colspan="2">Maximum of $1 million</td></tr>
</table>

The City has chosen the New Construction Project Type.

As a Responsible Agency, Metropolitan's Board of Directors will review and consider the proposal and environmental documentation prepared by the City in determining whether or not to approve financial assistance for the Program within the Recharge Pilot administrative process.

The Program would be consistent with Metropolitan's commitment to develop Recharge Pilot activities that would provide a better understanding of the connection between captured stormwater and water supply yield.

Clarification/Revision

The following modifications have been made to pages 82 and 83 of the Draft IS/MND to update the name of the library.

Section 2.5, Cultural Resources – Pages 82 and 83

Page 82

Less than Significant Impact with Mitigation. The cultural resources assessment identified three historic architectural resources within the Program area. These resources include: the David M. Gonzales Recreation Center featuring a clubhouse building dating to the park's period of significance of 1950 located approximately 65 feet from the Program construction footprint; North Hollywood Park featuring a maintenance building and pool house (65 feet and 100 feet from the Program construction footprint, respectively) and the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (located 100 feet from the Program construction footprint) dating to the park's period of significance of 1928–1931; and the 170 Freeway Pedestrian Overpass connecting Valley Plaza Park North and Whitsett Fields Park North located approximately 90 feet from a proposed diversion structure in Valley Plaza Park North. The North Hollywood Amelia Earhart Regional ~~Branch~~ Library is National Register of Historic Places (NRHP)-listed and, therefore qualifies as a historical resource.

Page 83

Mitigation Measures

CUL-1: In the event Program designs are further refined and individual Program site components change to encroach more closely than 50 feet to the North Hollywood Amelia Earhart Regional ~~Branch~~ Library (P-19-167303), the pool house and maintenance building associated with North Hollywood Park, the clubhouse associated with the David M. Gonzales Recreation Center, and/or the 170 Freeway Pedestrian Overpass, the City shall retain a qualified architectural historian meeting the Secretary of the Interior's Standards for Architectural History to review design plans for conformance with the Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards). Should potential Program redesign not conform to the Standards, the City shall work with the qualified architectural historian to mitigate impacts to these resources. Should Program redesign place Program components within 50 feet of these resources, the qualified architectural

historian shall also assess potential construction-related impacts resulting from ground-borne vibration. Should ground-borne vibrations have the potential to impact the historical resources, the City and the qualified architectural historian shall develop a plan to monitor ground-borne vibration during construction to ensure it does not exceed thresholds that could damage, or otherwise alter the historical resources.

SECTION 5
Mitigation Monitoring and Reporting Program

The Mitigation Monitoring and Reporting Program (MMRP) for the proposed Program has been prepared in accordance with Public Resources Code section 21081.6 and State CEQA Guidelines section 15091(d). The City will use this MMRP to track compliance with the Program mitigation measures. The City will consider the MMRP during the certification hearing for the Final IS/MND. The MMRP will incorporate all mitigation measures adopted for the proposed Program.

This MMRP summarizes potentially significant impacts and mitigation commitments identified in the Stormwater Capture Parks Program IS/MND. Table 5-1 provides the MMRP which includes all mitigation measures, monitoring/reporting action, monitoring timing, and responsible person(s) for implementation. Impacts and mitigation measures are presented in the same order as in the IS/MND. The columns in the table provide the following information:

- **Mitigation Measures:** The action(s) that will be taken to reduce the impact to a less-than-significant level.
- **Monitoring /Reporting Action:** This column outlines the appropriate steps to implement and verify compliance with the mitigation measures.
- **Monitoring Timing:** This column indicates the general schedule for conducting each monitoring task, either prior to construction, during construction, and/or after construction.
- **Responsible Person(s):** This column lists the agency responsible for ensuring implementation of the mitigation measure.

Notice of Proposed Project

First Notice

NOTICE OF PROPOSED PROJECT

City of Los Angeles
Department of Water and Power - WDEU
Water Distribution Engineering East Valley District

FIRST NOTICE

CITY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
BUREAU OF ENGINEERING

Date: November 3, 2021

The Department of Public Works is scheduling the following improvements:

Project Title: **STRATHERN PARK NORTH STORMWATER CAPTURE PROJECT**
Work Order No.: **EW40080D** **Job ID:** **1457**

Work to Be Performed: The proposed project consists of installing a 1.4-acre underground infiltration gallery to capture and infiltrate stormwater. Construction of the underground infiltration gallery will include installation of a storm drain diversion structure, storm pipe, pretreatment device, desilting basin, flow measuring device, level sensors, and education signage. Runoff will be collected from approximately a 445-acre tributary area and diverted into the infiltration gallery. The galleries shall be sized to store approximately 740,400 cf.

The project will include new park improvements such as two (2) baseball fields with the following amenities: backstops, dugouts, player benches, batting cage, bullpens, sports lighting, bleachers, and outfield fencing. Other improvements include additional parking, hydration stations, new landscaping, and a new irrigation system.

Please fill out the following and return one copy to the Utility Coordination Group by **December 3, 2021**.
PLEASE UPLOAD A COPY OF YOUR AS-BUILT PLANS, IN THE LINK PROVIDED IN THE EMAIL, SHOWING THE LOCATION OF YOUR FACILITIES (IN OR AROUND THE PROJECT AREA).

Your replies will be transmitted to prospective bidders and used in coordinating this project. Please note proper location of any facilities, live or abandoned, that are not shown or are shown incorrectly on the attached plans. The City will not be responsible for any damage to facilities that are not shown or are shown incorrectly on the plans. Failure to reply may deprive you of the protection provided for in the Standard Specifications. Construction delays and/or expenses due to failure in providing accurate information shall result in an assessment of costs to you, per Los Angeles Municipal Code (LAMC) 62.01 or your Franchise Agreement with the City.

Upon receipt and review of your response(s), the City will contact you to formalize your utility relocation (or protect-in-place) plan, with a utility relocation agreement if necessary.

For questions, please contact the **Project Manager Bryan Powell** at (213) 485-5908 or **bryan.powell**@lacity.org.

Summary of First Notice Replies

Date: December 6, 2021

CITY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
BUREAU OF ENGINEERING

SUMMARY OF FIRST NOTICE REPLIES

W.O. No.:	Job ID.:	Project Title:
EW40080D	**1457**	**STRATHERN PARK NORTH STORMWATER CAPTURE PROJECT**

Bidders are advised that project plans usually depict the location of substructures as they existed when the project was designed. Present-day information may indicate that new facilities may have been added or are going to be added. Some of those substructures may now be or will be relocated, abandoned, removed, lowered, raised, blanketed, encased, enlarged, protected, or altered in some other way. Bidders are urged to carefully examine the proposed construction site for any evidence of recent surfacing of excavations, or the possible conflict with surface or aerial installations. Contractor should use the latest substructure maps and prepare their bid accordingly. If further information or clarification is desired, bidders are urged to immediately contact the appropriate utility company or the appropriate District Office of the Bureau of Engineering. Contractors may also contact the Utility Coordination Group, 1149 S. Broadway Street, Suite 140, Los Angeles, CA 90015, naajia.jaml@lacity.org. The contractor will need to coordinate work with utility companies during construction if necessary.

Based on the confirmation from the following utility companies, they have facilities within the improvement area that will definitely be affected.

NONE

Based on the confirmation from the following utility companies, they have facilities within the improvement area that may not require relocation but will mark them upon request. Notify Underground Service Alert at 1-800-227-2600 two working days prior to excavation to have facilities marked:

BUREAU OF STREET LIGHTING	Daniel Ordonia	(213) 847 – 1568
SOUTHERN CALIFORNIA GAS – DISTRIBUTION	Art Alfaro	(213) 231 – 7808
CHARTER COMMUNICATIONS	Robert Reihs	(661) 483 – 3030
DWP – POWER	Gibson Phan	(213) 367 – 2715
SCE	Anthony Devestern	(661) 775 – 1040

Based on the confirmation from the following utility companies, there are no facilities within the improvement area that will be affected:

INFORMATION TECHNOLOGY AGENCY	Frank Gonzalez	(213) 978 – 4032

SOUTHERN CALIFORNIA GAS – TRANSMISSION	Ron Silver	(818) 701 – 4536

The following utility companies have not responded to the First Utility Notice, but they may have facilities within the improvement area.

AT&T CALIFORNIA	Cathy Hurtado	(626) 817 – 4263
LADWP – WATER – EAST VALLEY	Glenn Micko	(213) 367 – 1211

*** EXTERNAL EMAIL - Be cautious of attachments, web links, and requests for information ***

Hello SCG-Distribution,

Please find the proposed project above with the link below and download the Notice and plans. Please investigate your utility in the vicinity of this project and mark up the Notice accordingly. Access the link **using only the email address at which you are receiving this link, and according to the directions in the attached PDF. Be sure to sign out of any Microsoft accounts as well as out of any email addresses other than the one to which the link was sent for OneDrive to work properly.**

https://engsvcs.sharepoint.com/:f:/s/UtilityNotices/EjgVxGXXNOxPoqpGFsw0BQgBqbQ3kgZ_XXVCgDo1gTmxDQ?e=1u4Zqg [engsvcs.sharepoint.com]

The next link below directs you to a folder to upload the marked-up Notice and any additional correspondence, plans, etc. Access the link **using only the email address at which you are receiving this link, and according to the directions in the attached PDF. Be sure to sign out of any Microsoft accounts as well as out of any email addresses other than the one to which the link was sent.**

https://engsvcs.sharepoint.com/:f:/s/UtilityNotices/EpsJICu-PNZFiFz-KVUgJ3sBolx2k8W-8Ss1NEWD9LLSJA?e=L3D74s [engsvcs.sharepoint.com]

After clicking on the above links, a new tab will open and will ask to email you the code to access the folder. The code will be sent to the same utility email used here. After clicking "Send Code" and receiving the code via email, enter this code to gain access. It is possible the code number may go to your spam folder so please check this folder as well if you do not see the email in your inbox for a few seconds.

The links above will only be effective for 30 days. Do not forward the links to anyone, as they do not have permission to access the folders for which the links are created.

Thank you

Vishal Mandalia, EIT

Requester Project:	Map Request
Project Name	Strathern Street and Hollywood Freeway
DOCK/PRISM Project Name:	Strathern Street and Hollywood Freeway
Conflict:	YES

Thank you for your recent Utility Request to Charter Communications for: Strathern Street and Hollywood Freeway

Please review the attached maps for any possible conflicts with Charter facilities.
There ***ARE*** existing Charter aerial/or underground facilities within the project limits.

We have provided maps showing where our services are located but cannot make any comment on how to deal with possible conflicts during construction. This type of information should come from the Construction Manager, Supervisor or Construction Coordinator for the area in question.

If you should require any field meet or any further coordination of the project with Charter please contact the Construction Manager listed below.

Construction Manager Contact:
Reihs, Robert J
Construction Manager - Zones 1 and 4
14221 Covello St
Van Nuys, CA 91405

Memorandum of Agreement
By and Among the Los Angeles Department of Water and Power,
the Los Angeles Department of Public Works Bureau of Engineering,
and the Los Angeles Department of Recreation and Parks
for the Implementation of the Stormwater Capture Parks Program

AGREEMENT

This Memorandum of Agreement (Agreement) is made and entered into by and among the Los Angeles Department of Water and Power (LADWP), Los Angeles Department of Public Works Bureau of Engineering (BOE), and Los Angeles Department of Recreation and Parks (RAP) (collectively referred to as "Parties" or individually as "Party"), for the implementation of the Stormwater Capture Parks Program (Program).

WITNESSETH

WHEREAS, the City of Los Angeles (City) is home to approximately four (4) million residents who depend on reliable sources of water; and

WHEREAS, local water supply is a key resource that LADWP has historically utilized, and currently makes up about ten percent (10%) of the City's total water supply; and

WHEREAS, capturing additional stormwater for groundwater recharge is vital to sustain the long-term reliability of the City's local groundwater supply; and

WHEREAS, the City holds water rights in several local groundwater basins, with the San Fernando Groundwater Basin (SFB) groundwater rights being the most significant; and

WHEREAS, the City's groundwater rights in the SFB, as well as its pueblo rights to the surface waters of the Los Angeles River, were recognized and adjudicated by the California Supreme Court in *The City of Los Angeles v. City of San Fernando*, 14 Cal. 3d 199 (1975), and the subsequent judgment in *The City of Los Angeles v. City of San Fernando*, Los Angeles Superior Court Case No. 650079 (January 26, 1979); and

WHEREAS, LADWP is a municipally owned utility responsible for delivering water and power to the residents of the City; and

WHEREAS, BOE is responsible for the design and construction of capital improvement projects within the City's rights-of-way; and

WHEREAS, RAP is responsible for managing, operating, and maintaining parkland, public recreation facilities, and programs in the City to enhance the safety and enjoyment of park patrons, and holds property rights to certain properties in the City dedicated to such uses, which may be modified to allow capture of additional stormwater for groundwater recharge while still allowing for ongoing operation of parkland and public recreation facilities and programs; and

WHEREAS, the Parties are committed to the Program to pursue integrated opportunities to enhance recreational space; provide social, economic, and environmental benefits; increase stormwater capture for water supply reliability; and improve water quality; and

WHEREAS, LADWP and BOE entered into a prior agreement (Resolution No. 019075) to complete the Program design, under which LADWP agreed to finance the Program design costs, up to a maximum of nineteen million, one hundred thousand dollars ($19,100,000) and BOE agreed to facilitate project management, planning, and design efforts of the Program; and

WHEREAS, LADWP intends to pay the Program implementation costs through a combination of LADWP's funds, grant funds, and funding partnerships up to a maximum of two hundred and ninety-eight million dollars ($298,000,000); and

WHEREAS, LADWP has been awarded seventy-five million dollars ($75,000,000) by the Los Angeles County's Safe Clean Water Regional Program (SCWP), one million, eight hundred thousand dollars ($1,800,000) by the Integrated Regional Water Management Proposition 1 Rounds 1 and 2, and three million dollars ($3,000,000) by Storm Water Grant Program Proposition 1; and

WHEREAS, LADWP will continue to pursue other eligible grants and cost-sharing partnerships to help fund the remaining Program's costs with assistance from BOE and RAP, as appropriate; and

WHEREAS, LADWP agrees to own, operate, and maintain all stormwater capture infrastructure associated with the Program for the life of the Program; and

WHEREAS, LADWP's agreement to own, operate, and maintain all stormwater capture infrastructure associated with the Program extends to its agreement to be responsible, at its sole cost, for any and all impacts and damages to RAP properties and facilities resulting from its activities related to ownership, operation or maintenance of that stormwater capture infrastructure; and to restore the RAP properties and facilities to conditions as shown in the 100% design plan sets; and

WHEREAS, LADWP agrees that, at the end of the useful life of the stormwater capture infrastructure at each RAP property, LADWP shall be responsible, at its sole cost, to remove all such infrastructure. Subject to reaching an agreement with RAP at the end of the useful life of each project, LADWP may refurbish the Program to extend the useful life of each project, abandon-in-place, or a combination of the above, in lieu of removal. Any impacts or damages to RAP properties and facilities shall be restored to pre-existing conditions within eighteen (18) months; and

WHEREAS, BOE agrees to facilitate project management and delivery of the Program; and

WHEREAS, the Board of Recreation and Park Commissioners for the City of Los Angeles, by resolution dated _____, 2024, has agreed to DWP's use, in coordination with BOE and RAP, of RAP properties for these integrated opportunities to enhance recreational space, provide social, economic, and environmental benefits, increase stormwater capture for water supply reliability, and improve water quality, all as more fully described herein; and

WHEREAS, RAP agrees to the implementation of the Program at RAP properties; and

WHEREAS, subject to reaching agreement with LADWP, RAP agrees to maintain all new park improvements, including landscaping and recreational improvements, and access roads, at its cost, upon completion of each project within the Program.

NOW, THEREFORE, in consideration of the mutual benefits to be derived by the Parties, it is hereby agreed as follows:

1. PROGRAM INFORMATION

   a. Background

      The Program is a partnership among LADWP, BOE, and RAP. The Program consists of seven (7) projects to divert and capture approximately one thousand, eight hundred (1,800) acre-feet per year (AFY) of stormwater and urban runoff from a combined three thousand, four hundred (3,400) acre drainage area for infiltration at seven (7) City parks to replenish the underlying SFB.

      The proposed stormwater capture infrastructure will consist of infiltration galleries, hydrodynamic separators, pumps, permeable pavements, bioswales, catch basins, storm drains, and other green street elements. Underground galleries have been strategically sized and placed within the parks to maximize above-ground uses. In addition, the Program is intended to help to alleviate localized flooding; improve downstream water quality; and provide recreational, social, economic, and environmental benefits for underserved communities.

      LADWP and BOE entered into a prior agreement (Resolution No. 019075) to complete the Program design, under which LADWP agreed to finance the Program design costs, up to a maximum of nineteen million, one hundred thousand dollars ($19,100,000) and BOE agreed to facilitate project management, planning, and design efforts of the Program. This subsequent Agreement is a continuing partnership for the bid and award, construction, and post-construction phases of the Program.

b. Location

The Program's projects are located at parks in the eastern San Fernando Valley in Council Districts 2, 6, and 7. See **Attachment 1, Program Map**. The Program's seven projects include:

i. David M. Gonzales Recreation Center Stormwater Capture Project (David Gonzales Park);
ii. Fernangeles Park Stormwater Capture Project (Fernangeles Park);
iii. Strathern Park North Stormwater Capture Project (Strathern Park);
iv. Whitsett Fields Park North Stormwater Capture Project (Whitsett Park);
v. Valley Plaza Park North Stormwater Capture Project (Valley Plaza Park North);
vi. Valley Plaza Park South Stormwater Capture Project (Valley Plaza Park South); and
vii. Valley Village Park Stormwater Capture Project (Valley Village Park).

c. Scope

This Agreement governs the Program's bid and award, construction, and post-construction phases, which include, but are not limited to, the preparation and approval of bid documents, advertisement and award of construction contracts, outreach, design support during bid and award, design support during construction, securing outstanding permits for phases 1 and 2 construction projects, construction, construction management, and post-construction tasks including, but not limited to, as-built plans, contract close-out, and project acceptance by the Board of Public Works, Board of Recreation and Parks, and Board of Water and Power Commissioners.

Under the Program, the Parties intend to divert and capture stormwater for infiltration at various City parks to increase replenishment of the SFB. The proposed stormwater capture infrastructure consists of infiltration galleries, hydrodynamic separators, pumps, permeable pavements, catch basins, storm drains, and other green street elements, as shown in **Attachment 4**.

d. Budget and Funding

The Program's estimated cost for bid and award, construction, construction management, and post-construction phases, as well as RAP's additional staff to perform tasks related to the Program and lost permit revenue, is approximately two hundred and ninety-eight million dollars ($298,000,000). LADWP secured seventy-nine million, and eight hundred thousand dollars

($79,800,000) through Measure W Safe Clean Water Program, Prop 1 Integrated Regional Water Management Rounds 1 and 2, and Prop 1 Stormwater Grant Program Round 2. LADWP continues to seek additional state and federal funds.

Each project within the Program will be evaluated individually and only proceed with implementation once LADWP determines the project has secured full funding. Any project bids exceeding the project costs provided in this Agreement shall require a written amendment to this Agreement signed by all Parties. If LADWP deems, in its sole discretion, that a project is no longer feasible to award a construction contract, LADWP will provide BOE and RAP with written notification to terminate work on the project. BOE shall only invoice LADWP for costs incurred subsequent to execution of this Agreement and prior to the Agreement termination date consistent with Section 6.a. If terminated, provisions in Section 6.I shall apply on an individual project basis.

The following tables show the total estimated Program costs:

Project	Estimated Project Cost[1]
Fernangeles Park	$42,900,000
Strathern Park	$41,900,000
Valley Village Park	$20,200,000
David Gonzales Park	$65,200,000
Valley Plaza Park North	$62,700,000
Valley Plaza Park South	$32,300,000
Whitsett Park	$32,500,000
Total:	**$297,700,000**

[1] Design cost not included

RAP	Estimated Cost[2]
Additional RAP staffing cost	$238,913
Lost permit revenue	$38,462
Storage bins	$22,625
Total:	**$300,000**

[2] RAP compensation amount per project is provided in **Attachment 2**

e. Schedule

Attachment 3 shows the anticipated construction schedule for each project within the Program. Bid and award and post-construction are not accounted for in the table below. The Program is separated into two (2) construction phases

to comply with California Environmental Quality Act (CEQA) mitigation measures and to minimize impacts to stakeholders and the community during construction. The Parties agree that this construction schedule shall be updated at least annually, by June 30th of each year, to reflect the actual current schedule for these activities.

2. LADWP AGREES TO:

   a. Provide written authorization to BOE to commence work related to bid preparation and advertisement of the specified project(s) within the Program after this Agreement becomes effective and upon identifying and securing full project funding. LADWP will provide a subsequent written authorization to BOE to either award a construction contract or terminate the specified project(s) within the Program.

   b. Provide funding for the Program implementation costs, which includes the Program bid and award, construction, and post-construction phases, up to a maximum of two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000), through a combination of LADWP's funds, grant funds, and funding partnerships, solely for service costs in accordance with Section 5.

   c. Reimburse RAP up to three hundred thousand dollars ($300,000) for additional staff costs related to the Program and lost permit revenue during construction. Any increase in reimbursement to RAP shall be agreed upon by LADWP and RAP through an amendment.

   d. In accordance with Section 5 of this Agreement, reimburse BOE, and BOE's suppliers and contractors, up to two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000) for all eligible costs related to the Program, including the application of the appropriate full Cost Allocation Plan overhead rates.

   e. Authorize BOE to represent LADWP in all negotiations including, but not limited to, permit acquisition in accordance with Section 3.c, relocation of non-LADWP utilities, construction, bid and award, and construction contract administration. LADWP shall have the right to make final decisions and approve all work related to the Program.

   f. Participate in Program meetings, make decisions, provide technical assistance, and provide direction to BOE regarding the Program in a timely manner.

   g. Lead community outreach on updates and milestones involving the Program.

h. Provide BOE, at LADWP's sole discretion, a temporary right-of-way, license, right-of-entry or other access across property owned or controlled by LADWP, as necessary for the Program's construction.

i. If necessary, collaborate with RAP after construction of the Program and enter into a separate contract to identify locations and complete any unfulfilled tree mitigation requirements at LADWP's cost, as set by RAP.

j. Advise BOE and RAP regarding grant agreements and requirements from State of California Proposition 1 and County of Los Angeles SCWP.

k. Acknowledge BOE and RAP as Program partners in all LADWP approved materials, publications, press releases, signage, and communications related to the Program.

l. Own, operate, and maintain all stormwater capture infrastructure associated with the Program, as shown in **Attachment 4**, for the life of the Program, which includes, but is not limited to: diversion structures, catch basins, conveyance pipes, hydrodynamic separators, permeable pavements, pumps, baffle boxes, sedimentation basins, underground infiltration galleries, Supervisory Control and Data Acquisition systems or other instrumentation and control systems to the extent applicable, control panels, flow meters, levels, and prefabricated utility structures. Costs associated with operation and maintenance of LADWP's stormwater capture infrastructure shall be LADWP's responsibility; costs associated with operation and maintenance of RAP's facilities shall be RAP's responsibility.

m. Accept sole and full responsibility for management, regulatory compliance, permitting, maintenance, and operation of the stormwater capture infrastructure upon completion.

n. Be responsible, at its sole cost, for any and all impacts and damages to RAP properties and facilities resulting from its activities related to ownership, operation, or maintenance of that stormwater capture infrastructure, including in the event that LADWP's stormwater capture infrastructure is cancelled or is only partially completed, and to restore the RAP properties and facilities to pre-existing conditions within eighteen (18) months of RAP providing LADWP written notice of such impacts or damages.

o. Be responsible, at its sole cost, at the end of the useful life of the stormwater capture infrastructure at each RAP property, to remove all such infrastructure. Subject to reaching an agreement with RAP at the end of the useful life of each project, in lieu of removal, LADWP may refurbish the stormwater capture infrastructure to extend the useful life of each project, abandon-in-place, or a combination of the above for all such infrastructure. RAP properties and facilities shall be restored to pre-existing conditions within eighteen (18) months thereafter.

p. Finalize all operation and maintenance (O&M) agreements related to stormwater capture infrastructure prior to the completion of construction for each project, either with LADWP's workforces or through a third-party contractor or agency.

q. Provide RAP advance notice, as indicated in the O&M Manual created pursuant to Section 3.n, to coordinate O&M of the stormwater capture facilities. Advance notice will be provided by LADWP to enter the Program sites to perform maintenance of the facilities. Notice must include the date, location, and duration of the maintenance and will be subject to RAP approval, which shall not be unreasonably denied. Maintenance conducted by LADWP shall not impede or interfere with any recreational activities or programming.

r. The O&M related provisions in Section 2, including Sections 2.k. though 2.p., shall survive termination of this Agreement and remain in effect until the end of the useful life of the project.

s. In the event that LADWP finds significant contamination or other site conditions that make a project infeasible, LADWP may decide to cancel that project. LADWP shall be responsible for all costs associated with any actions it undertook up to the point of its decision to cancel, including removal and disposal of any excavated soil found to be contaminated. In the event that LADWP decides to proceed with the stormwater capture infrastructure project notwithstanding the contamination or other condition, LADWP shall be responsible for all costs associated with removal of any contaminated soil.

3. BOE AGREES TO:

a. Commence work only upon issuance of written authorizations as stated in Section 2.a of the specified project(s) within the Program from LADWP.

b. Advertise the Program for construction bids, award and administer the construction contract(s), and cause the Program to be constructed in accordance with the said plans, specifications, scope, budget and schedule. Construction contracts will be awarded by the Board of Public Works.

c. Use LADWP funds solely for costs of services rendered for work performed in accordance with this Agreement. These funds shall be used to acquire or renew necessary permits, prepare bid documents, advertise and award construction contracts, provide design support during bid and award, provide design support during construction, construct the Program, and perform post-construction tasks including, but not limited to, as-built plans, contract close-out, and project acceptance by the Board of Public Works, Board of Recreation and Parks, and Board of Water and Power Commissioners.

d. Instruct and require BOE's suppliers and contractors to copy LADWP on all invoices submitted to Los Angeles Department of Public Works, Bureau of Contract Administration (BCA) for payment in accordance with the terms of the contracts awarded by BOE pursuant to Section 3.b. of this Agreement. Prior to the awarding of bid packages, BOE shall instruct and require all suppliers and contractors to submit a Supplier/Contractor Data Form, as shown in **Attachment 6**, directly to LADWP to create vendor codes for same.

e. BOE, and BOE's suppliers and contractors, shall only invoice LADWP for costs incurred during the term of this Agreement and prior to the Program termination date; LADWP is not responsible for costs incurred by BOE or BOE's suppliers and contractors outside that term.

f. Propose changes or modifications to the plans and specifications of the Program, including as may be necessitated by unforeseen, or unforeseeable, conditions encountered during construction, and consult with LADWP and RAP on any fundamental design changes. Subject to its consideration of RAP's right to provide input as to impacts on RAP's recreational facilities, LADWP shall have the right to make final decisions on all fundamental design changes for the Program and each individual project therein.

g. Develop Program milestones and report at each milestone consistent with BOE's and LADWP's project delivery processes.

h. Provide a minimum seven (7) day notice to LADWP and RAP to participate in meetings.

i. Upon full execution of this Agreement, prepare and send, and instruct its suppliers and contractors to send invoice(s) to LADWP in accordance with Section 5.

j. Use Generally Accepted Accounting Principles and comply with any and all other requirements of the City Controller to account for, transfer, and receive reimbursement funds for the Program.

k. Keep LADWP and RAP apprised of information, of which BOE becomes aware, pertaining to the status of the Program.

l. Provide construction documents and specifications to LADWP and RAP staff for review upon request.

m. Perform repairs and adjustments for all projects identified by LADWP prior to issuance of Statement of Completion.

n. Prepare and provide O&M plans and manuals and trainings to the satisfaction and requirements of LADWP.

o. Turn each project over to LADWP after witness testing, signoff of operational tests to confirm functionality of facility as designed, and final acceptance and turnover checklists per operator procedures.

p. Participate in community outreach on updates and milestones involving the Program.

q. Obtain approval from the Board of Recreation and Parks of the final plans and specifications for all portions of each project within the Program to be constructed on RAP property prior to the advertisement and award of a project by the Board of Public Works.

r. Support LADWP in grant applications and all grant-related documentation, including, but not limited to, providing labor hours, cost, schedule, and Program expenses, as needed for grant applications or reporting.

s. For Program projects awarded grant funds, such as from the State of California's Proposition 1 and County of Los Angeles SCWP, adhere to all grant requirements specified in the project's grant agreement, including incorporating grant requirements in all contracts BOE awards pursuant to this Agreement. Grant requirements include but are not limited to: retention of records, audits, and reports (minimum of thirty-six (36) years); insurance; contractor responsibility ordinance; project access; bonding; labor compliance; and signage.

t. Acknowledge LADWP and RAP as Program partners in all LADWP-approved material, publications, press releases, signage, and communications related to the Program.

u. Acknowledge LADWP's Power System Transmission Vegetation Management Group Contractor is currently occupying the Transmission Line Right of Way (TLRW) easement at Strathern Park. BOE shall allow the Contractor to continue with the occupancy and unfettered access of the LADWP TLRW through the construction of the project at Strathern Park. BOE shall coordinate these efforts with Mr. Juan Pelayo (Juan.Pelayo@ladwp.com).

4. RAP AGREES TO:

a. Participate in Program meetings and community outreach on updates and milestones involving the Program.

b. Grant BOE and LADWP, at no cost, any temporary rights-of-way, easements, right-of-entry, or grant of right for any real property that RAP owns, or has easements for, that are necessary for the Program's construction and that are consistent with the Charter of the City of Los Angeles.

c. Support LADWP in grant applications and all grant-related documentation, including, but not limited to, providing labor hours, cost, schedule, and Program expenses, as needed for grant applications and reporting.

d. RAP will have sole and full responsibility for overall park management, regulatory compliance, permitting, maintenance, and operation.

e. Finalize all O&M agreements related to RAP facilities prior to the completion of construction for each project, either with RAP's workforces or through a third-party contractor or agency.

f. Following RAP acceptance of each individual project, issue right-of-entry permits upon request for the post-construction phase and long-term post-construction O&M to identify repairs and adjustments to all civil, architectural, structural, mechanical, electrical, and instrumentation stormwater capture infrastructure installed as part of the Program, which includes, but is not limited to: diversion structures, catch basins, conveyance pipes, hydrodynamic separators, pumps, baffle boxes, sedimentation basins, underground infiltration galleries, Supervisory Control and Data Acquisition or other instrumentation and control systems as applicable, control panels, flow meters, levels, and prefabricated utility structures. The template form of the right of entry that RAP will provide to LADWP and its contractors to perform these activities is attached hereto as **Attachment 5**.

g. Subject to agreement with LADWP, perform the O&M of the Program's landscaping and irrigation components as to those elements for which LADWP is not responsible for O&M pursuant to Section 2 above.

h. Maintain the park trails, access roads, fencing, signage, trash receptacles, sports lighting, related electrical control panels, any electric vehicle station infrastructures, and recreational features of for each Program project.

i. Collaborate with LADWP to reach agreement to resolve situations where LADWP's activities related to ownership, operation or maintenance of its stormwater capture infrastructure result in impacts and damages to RAP properties and facilities.

j. Collaborate with LADWP to reach agreement to resolve the refurbishment, abandon-in-place, or removal and remediation of the stormwater capture infrastructure at each RAP property at the end of its useful life.

k. Continue to have sole and full responsibility for overall park management, permitting, maintenance, and operation. LADWP will have sole and full responsibility for management, regulatory compliance, permitting, maintenance, and operation of the stormwater capture infrastructure. Costs

associated with operation and maintenance of LADWP's stormwater capture infrastructure shall be LADWP's responsibility; costs associated with operation and maintenance of RAP's facilities shall be RAP's responsibility.

l. Acknowledge BOE and LADWP as Program partners in all LADWP approved material, publications, press releases, signage, and communications related to the Program.

5. INVOICES AND REIMBURSEMENT

a. BOE shall invoice LADWP for costs it incurs related to the Program, including BOE labor and BOE non-labor costs. LADWP shall pay BOE's approved invoices directly to BOE Accounting within thirty (30) calendar days of receipt of those invoices.

b. BOE's suppliers and contractors shall submit their invoices to the Los Angeles Department of Public Works Bureau of Contract Administration (BCA), BOE and LADWP simultaneously. Upon subsequent receipt of reviewed and undisputed invoices approved by BCA, BOE shall provide supplier and contractor invoice approval notices to LADWP within five (5) days of receipt. Concurrently, upon receipt of reviewed and undisputed invoices approved by BCA, LADWP shall have thirty (30) days to review, approve, and pay the invoices directly to BOE's suppliers and contractors. LADWP will not unreasonably withhold payment of the invoices to BOE's suppliers and contractors in order to comply with the City's vendor payment policy.

c. RAP shall invoice LADWP for Program costs associated with additional staff and lost permit revenues up to three hundred thousand dollars ($300,000) upon the issuance of the applicable Statement of Completion for each site. Any increase in reimbursement to RAP shall be agreed upon by LADWP and RAP through an amendment.

d. Invoice documentation shall state such services as were performed under this Agreement and comply with all City invoicing policies.

e. Subject to LADWP approval of contractor change order request, payment of construction change orders shall be included in regular invoices for payment. The total compensation by LADWP to BOE, and BOE's suppliers and contractors, including change orders for complete and satisfactory performance of services under this Agreement shall not exceed two hundred and ninety-seven million, seven hundred thousand dollars ($297,700,000) per Section 1.d. All construction change order requests are subject to consultation with and payment approval by LADWP.

f. Of the total amount of compensation included in Section 1.d above, LADWP shall only pay BOE, and BOE's suppliers and contractors, for services

performed, tasks implemented, and deliverables provided as specified in the Agreement. LADWP shall not be liable for monetary payments unless there is a document outlining performed services, completed tasks, and provided deliverables that are approved by LADWP's authorized representative(s) identified in this Agreement.

g. LADWP shall not be obligated to pay for work performed by BOE, and BOE's suppliers and contractors, for any such changes made in violation of this Agreement.

h. BOE shall provide quarterly progress reports throughout the term of this Agreement that will include schedule, budget, and work completed during the previous quarter and an estimate of the percentage completed. Progress reports shall be submitted to LADWP and RAP within forty-five (45) calendar days of the end of each respective quarter. Quarters shall be defined as the periods from January 1 to March 31, April 1 to June 30, July 1 to September 30, and October 1 to December 31.

6. IT IS MUTUALLY UNDERSTOOD AND AGREED:

a. This Agreement shall become effective upon execution by all Parties and terminate fifty-four (54) months thereafter. All work described in Section 1 shall be completed within the term of this Agreement. Any Party may terminate this Agreement for any reason by giving the other Parties thirty (30) calendar days written notice. In the event of termination by any Party prior to the date of completion of all of the projects in the Program: (i) the Parties agree to take all reasonable measures to prevent further costs under Agreement; (ii) LADWP will provide payment for any outstanding invoices for work performed up to the termination date, and will have no further financial obligations beyond the date of termination; (iii) BOE shall provide LADWP a final progress report that summarizes the total expenditure incurred under this Agreement with a copy of any completed or work-in-progress documents stated in Section
1.c and shall have no further obligation or liability to LADWP or City in regard to the performance of this Agreement; and (iv) any unspent funds will be transferred from BOE and/ or RAP to LADWP.

b. Subject to LADWP's obligations under this Agreement, including its O & M-related obligations under Section 2 (e.g., Section 2.k. through 2.p.), RAP and BOE recognize and agree that LADWP may reduce the scope and cost of the Program if LADWP determines, in its sole discretion, that any portion of the Program scope is technically infeasible to construct within the available budget.

c. The project management for the Program will be performed in accordance with the latest BOE standards and practices.

d. Each Party shall have no financial obligation to the other Parties under this Agreement, except as herein expressly provided.

e. No amendment or waiver of any provision of this Agreement, nor consent to any departure, shall be effective unless in writing and signed by each Party, and then such waiver or consent shall be effective only in the specific instances and for the specific purpose given.

f. This Agreement shall be governed, interpreted under, construed, and enforced in accordance with the laws of the State of California.

g. LADWP shall have the opportunity to participate, provide input, and approve the work mentioned in Section 1.c that is to be performed by the other Parties.

h. The Parties shall be required to make staff reasonably available, if requested, to participate and provide input at scheduled meetings, community meetings, workshops so as to not impact the Program schedule.

i. Notwithstanding any other provision of this Agreement, LADWP may determine not to implement the Program, or any portion thereof, if its environmental review pursuant to the CEQA discloses that the Program, or portion thereof, will have significant environmental impacts. In the event LADWP determines not to implement the Program, and so communicates to the Parties in writing, this Agreement shall be deemed terminated and the Parties shall have no further obligations to each other under this Agreement. In the event LADWP, determines not to implement a portion of the Program, and so communicates to the Parties in writing, this Agreement shall be deemed terminated as to that portion of the Program only, and the Parties shall have no further obligations to each other under this Agreement as to that portion of the Program.

j. To make all reasonable efforts to keep costs within the budgeted amounts, no Party shall be obligated to provide additional funding toward the completion of work called for by this Agreement, unless otherwise mutually agreed to by the Parties and reflected in a written amendment to this Agreement.

k. Cost performance shall be evaluated at regular intervals to ensure the cost-effectiveness of the Program is maintained.

l. In the event that performance on the part of any Party hereto is delayed or suspended as a result of circumstances beyond the reasonable control and without the fault and negligence of said Party, none of the Parties shall incur any liability to the other Parties as a result of such delay or suspension. Circumstances deemed to be beyond the control of the Parties hereunder include, but are not limited to, acts of God or of the public enemy; insurrection; acts of the federal government or any unit of state or local government in either sovereign or contractual capacity; fires; floods; earthquakes; epidemics;

pandemics; quarantine restrictions; strikes; freight embargoes or delays in transportation, to the extent that they are not caused by the Parties willful or negligent acts or omission.

m. As it relates to the management and oversight of all of the services associated with a Party's obligations under this Agreement, each Party shall retain all liability for its contractors, agents or invitees and each of the contractor's officers, agents, employees, or subcontractors of any tier. With respect to any liability or damage incurred on RAP property, except to the extent attributable to the sole or active negligence or willful misconduct of RAP, LADWP undertakes and agrees to promptly pay, reimburse, cover, and/or otherwise be financially responsible to RAP for, any and all costs arising in any manner by reason of, or incidental to, the actions of LADWP and/or their contractor or subcontractor of any tier in connection with this Agreement ("Costs"). Such Costs shall include, without limitation, all costs of litigation, claims, losses, demands, expenses, damage or liability of any nature whatsoever (including for death or injury to any person, including LADWP's employees, contractors and agents), or damage or destruction of any property.

7. RIGHT TO AUDIT

BOE shall maintain, and shall cause BOE's consultants and suppliers to maintain, all records pertaining to this Agreement, and related subcontracts, in their original form, including but not limited to, reports, documents, deliverables, employee time sheets, accounting procedures and practices, records of financial transactions, and other evidence, regardless of form (e.g., machine readable media such as disk, tape, etc.) or type (e.g., databases, applications software, database management software, utilities, etc.), sufficient to properly reflect all costs claimed to have been incurred and services performed pursuant to Agreement. If BOE or its contractors, consultants, or suppliers are required to submit cost or pricing data in connection with Agreement, BOE shall maintain all records and documents necessary to permit adequate evaluation of the cost or pricing data submitted, along with the computations and projections used. All records shall be retained, and shall be subject to examination and audit by LADWP personnel or by LADWP's agents (herein after referred to as Authorized Auditors), for a period of not less than thirty-six (36) years following payment made by LADWP hereunder or the expiration date of Agreement, whichever is later. BOE shall make said records or to the extent accepted by the Authorized Auditors, photographs, microphotographs, etc. or other authentic reproductions thereof, available to the Authorized Auditors at BOE's offices at all reasonable times and without charge. Authorized Auditors will have the right to reproduce, photocopy, download, transcribe, and the like any such records. Any information provided by BOE on machine-readable media shall be provided in a format accessible and readable by the Authorized Auditors. BOE shall not, however, be required to furnish the Authorized Auditors with commonly available software.

BOE and its contractors, consultants, and suppliers, as applicable to the services provided under Agreement, shall be subject at any time within sixty (60) calendar days, prior written notice to audits or examinations by Authorized Auditors, relating to all billings and to verify compliance with all Agreement requirements relative to practices, methods, procedures, performance, compensation, and documentation.

Examinations and audits will be performed using generally accepted auditing practices and principles and applicable City, County, State and Federal government audit standards. For consultants, subconsultants, and suppliers that utilize or are subject to Federal Acquisition Regulation (FAR), Parts 30 and 31, et seq. accounting procedures, or a portion thereof, examinations and audits will utilize

To the extent that the Authorized Auditor's examination or audit reveals inaccurate, incomplete, or noncurrent records, or records are unavailable, the records shall be considered defective.

Consistent with standard auditing procedures, BOE will be provided sixty (60) calendar days to review the Authorized Auditor's examination results or audit and respond to LADWP prior to the examination's or audit's finalization and public release.

If the Authorized Auditors' examination or audit indicates BOE, or BOE's suppliers and contractors, have been overpaid under a previous payment application, the identified overpayment amount shall be paid by BOE, or BOE's suppliers and contractors, to LADWP within ninety (90) calendar days of notice to BOE.

If applicable, having received written notice by LADWP in advance of contract bid and award, BOE shall contractually require all contractors, consultants and suppliers performing services under Agreement to comply with the provisions of this section by inserting this provision GC-18 in each contractor's contract and by contractually requiring each subcontractor to insert this provision GC-18 in any of its subcontractor contracts related to services under Agreement. In addition, BOE, their contractors, consultants, and/or suppliers, shall also include the following language in each contract:

> The Los Angeles Department of Water and Power (LADWP) is a third-party beneficiary of the foregoing audit provision. The benefits of the audit provision shall inure solely for the benefit of LADWP. The designation of LADWP as a third-party beneficiary of the audit provision shall not confer any rights or privileges on BOE, BOE's contractors, suppliers, or consultants, or any other person or entity.

If an examination or audit undertaken pursuant to the Retention of Records, Audit, and Reports provision of the General Conditions GC-18 for LADWP Professional Service Contracts reveals that LADWP overpayment to the consultant is more than five percent (5%) of the billings reviewed, the consultant shall pay all expenses and costs incurred by the Authorized Auditors arising out of or related to the examination or audit. Such examination or audit expenses and costs shall be paid by the consultant to LADWP within ninety (90) calendar days of notice to the consultant of the costs and expenses.

The provisions of this section shall survive expiration or termination of Agreement.

8. NOTICES

All notices provided under this Agreement must be in writing and, unless otherwise provided herein, shall be deemed validly given on the date either: (1) personally delivered to the address indicated below; or (2) on the third business day following deposit, postage prepaid, using certified mail, return receipt requested, in any United States Postal mailbox or at any United States Post Office. All notices, demands, or requests shall be addressed to the following:

9. AMENDMENTS AND WAIVER

No amendment or waiver of any provision of this Agreement, nor consent to any departure, shall be effective unless in writing and signed by each Party, and then such waiver or consent shall be effective only in the specific instances and for the specific purpose given.

10. NO THIRD-PARTY BENEFICIARIES

There are no third-party beneficiaries of this Agreement and nothing in this Agreement, express or implied, is intended to confer on any person other than the Parties hereto any rights, remedies, obligations or liabilities.

11. COMPLETE AGREEMENT

This Agreement supersedes any prior agreement, oral or written and contains the entire agreement of the Parties on the subject matter hereof. No subsequent agreement, representation, or promise made by a Party, or its officers, employees, agents, or representatives, shall be of any effect unless it is in writing and executed by the Party to be bound.

12. EXECUTION IN COUNTERPARTS

This Agreement may be executed in one or more counterparts, and by the Parties in separate counterparts, each of when so executed shall be deemed an original and all of which taken together shall constitute one and the same agreement. The Parties further agree that facsimile signatures or signatures scanned into .pdf and sent by e-mail shall be deemed original signatures.

IN WITNESS WHEREOF, each Party hereto has caused this Agreement to be executed by its duly authorized representatives.

RAP's Right of Entry Template Form

_____ 2023

Los Angeles Department of Water and Power
Name
Title
221 North Figueroa Street, Suite 1620
Los Angeles, CA 90012

_____ PARK – 12345 _____ STREET, _____, CA ZIP CODE: MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY (MOU-ROE) AUTHORIZING LOS ANGELES DEPARTMENT OF WATER AND POWER (LADWP) TO _____ – MOU-ROE NO. _____

Dear Name

The City of Los Angeles, Department of Recreation and Parks (hereinafter referred to as **RAP**) hereby issues revocable MOU-ROE No. _____, to LADWP and its contractors (hereinafter referred to as **PERMITTEE**) for temporary access to _____ Park. This MOU-ROE is granted between **RAP** and **PERMITTEE**. Said MOU-ROE will not become effective until proof of insurance is provided and MOU-ROE is properly executed and returned to **RAP** as noted.

MOU-ROE No. _____, is issued subject to the following conditions:

1. **MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY AREA DEFINED**

   The area covered under this MOU-ROE is **RAP** property known as _____ Park. The property is located at _____ Street, _____ CA ZIP. Please see attached maps for reference of permitted areas.

2. **PERMISSION GRANTED**

   Permission is granted to the **PERMITTEE** and/or its contractor(s) to enter the permit area (see attached maps) to conduct at the permit area the following scope of work and other project related work as approved by **RAP** staff: [DESCRIBE SCOPE]

3. **TERM**

   The term of this MOU-ROE shall be from DATE to DATE. A request to extend the term or conditions of this MOU-ROE shall be made in writing to the person named in Condition No. 8 below and coordinated with Region staff.

This MOU-ROE can be terminated by **RAP** as listed in Condition No. 12.

4. HOURS OF OPERATION

In accordance with this MOU-ROE, the approved operating hours for the permitted work by **PERMITTEE** should be in accordance with scheduled hours of operation as designated and approved by Region staff. Any change or request regarding hours of operation must be requested per Condition No. 8 and approved by **RAP** staff.

5. DEPARTMENT AUTHORITY

PERMITTEE shall at all times abide by the rules and regulations heretofore adopted or that may hereafter be adopted by **RAP** and cooperate fully with **RAP** employees in the performance of their duties.

NAME Pr. Grounds Maintenance Supervisor II, or his designee is the **RAP** ### Region Maintenance representative for the permitted activities at the subject property.

NAME may be reached at: PHONE, email: _____. **PERMITTEE** shall coordinate all work with Mr. Calloway or his designee upon receipt of this MOU-ROE.

NAME Pr. Recreation Supervisor I, or his designee is the **RAP** ### Region Recreation representative for the permitted activities at the subject property.

NAME may be reached at: PHONE, email: _____. **PERMITTEE** shall coordinate all work with NAME or his designee upon receipt of this MOU-ROE.

6. RIGHT OF INSPECTION

Authorized representatives, agents, and employees of **RAP** shall have the right to enter the premises at any time in case of emergency, and upon reasonable notice for purposes of property inspection.

7. MAINTENANCE OF PROPERTY

A. **PERMITTEE** will be responsible for any damages or repairs caused during the permitted period.

B. Upon completion of the work, it is understood that the **PERMITTEE** agrees to notify **RAP** of such work. Notification shall be made to the **RAP** representative designated in Condition No. 5.

C. The **PERMITTEE** shall maintain the permitted premises in an orderly condition during the work period or term of agreement, including the protection of those existing facilities at the park that will not be impacted by this project.

D. Work will not be permitted until **RAP** staff is present at the indicated hours of operation.

E. Contractor shall take all necessary steps to ensure safety and abide by any/all Federal, State and/or Local regulations governing the use and operation of equipment, in the

performance of approved work and ensure the protection and warning of any park user that could be in the area.

8. MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY NOTIFICATIONS

Should the **PERMITTEE** desire modifications to this MOU-ROE, time extensions of the MOU-ROE, or additional work to be performed, etc., request for said modifications and/or additions shall be submitted, in writing, to:

Attention: Rick Tonthat, Sr. Management Analyst II
City of Los Angeles, Department of Recreation and Parks
Planning Maintenance & Construction Branch
221 N. Figueroa Street, Suite 400
Los Angeles, CA 90012

Telephone: (213) 202-2608
Fax: (213) 202-2612

Or via email to: rick.tonthat@lacity.org

9. RESTORATION AND FINAL INSPECTION

PERMITTEE shall restore all **RAP** property that is damaged, moved or altered as a result of the permitted work at the permitted area to its original condition. Said restoration shall take place immediately upon the conclusion of said work and shall be performed to the satisfaction of **RAP**. Upon completion of the permitted work, **PERMITTEE** shall contact the **RAP** coordinator in Condition No. 5 to arrange a final **RAP** inspection of the completed project.

10. PERMITTEE CONTACT

PERMITTEE contact will be:

Name: Name of Permittee, Position
Phone No.: (###) ###_####
Cell No.: (###) ###-####
Email:

11. FINANCIAL RESPONSIBILITY AND INSURANCE

It is hereby understood that **PERMITTEE** is self-insured concerning any claims that may arise as a result of the approved work and use of the permitted area. **PERMITTEE** and its contractors shall insure that any of its contractors obtain and keep in force during the term of this MOU-ROE, insurance coverages from insurers acceptable to **RAP**.

Except to the extent attributable to the active negligence or willful misconduct of **RAP**, **PERMITTEE** undertakes and agrees to promptly pay, reimburse, cover, and/or otherwise be financially responsible to **RAP** for, any and all costs arising in any manner by reason of, or incidental to, the performance or this MOU-ROE on part of **PERMITTEE** and/or their contractor or subcontractor of any tier ("Costs"). Such Costs shall include, without limitation, all costs of litigation, claims, losses, demands, expenses, damage or liability of any nature whatsoever

(including for death or injury to any person, including **PERMITTEE'S** employees, contractors and agents), or damage or destruction of any property of either party hereto or of third parties.

PERMITTEE shall maintain, during the term of this MOU-ROE, evidence of insurance acceptable to CAO, Risk Management prior to **PERMITTEE'S** occupancy of the premises.

12. REVOCATION OF MEMORANDUM OF UNDERSTANDING OF RIGHT-OF-ENTRY

RAP may revoke this MOU-ROE at any time or if **PERMITTEE** does not comply with the conditions contained herein. Upon receipt of the written notice of revocation, **PERMITTEE** shall return the property to its original condition and discontinue all work permitted under this MOU-ROE.

13. ACCEPTANCE

Please indicate your acceptance of the foregoing in the signature block of this letter, and return the signed original copy to the **RAP** office noted in the letterhead.

Sincerely,

JIMMY KIM

INSTRUCTIONS FOR COMPLETING THE SUPPLIER/CONTRACTOR DATA FORM

1) **TRC NO.** – Enter your (Business) Tax Registration Certificate Number. Firm's current Tax Registration Certificate Number or Business Tax Exemption Number must be shown on all invoices submitted for payment. Failure to do so may delay payment. For additional information regarding the applicability of the City Business Tax Registration, vendor shall contact the City Clerk's Office at (213) 978-1521.

2) **FEDERAL TAX ID NUMBER** – For purposes of 1099 Reporting, the name and Tax ID may result in delay of payment and may subject you to 31% backup withholding to comply with Sec. 3406 of the Internal Revenue Code.

3) **STANDARD INDUSTRIAL CODE** – Enter SIC number.

4) **CONTRACTOR LICENSE NUMBER AND EXPIRATION DATE** – Enter license number and date contractor license expires.

5a) **FIRM NAME** – Enter complete legal name(s) of owner(s) or corporate name entered on the Corporate Charter. **Division of Subsidiary of** – Check if you are a division or subsidiary and give the firm's affiliation name.

5b) **BUSINESS TYPE** – Check one; if "OTHER" is checked, please specify what type of business organization (e.g. Joint Venture, LLC, etc.)

6) **BID/MAILING ADDRESS** – Enter where you want bids and correspondence mailed.

7) **BUSINESS LOCATION** – Enter your business street address, if mailing address is a P.O. Box address.

8) **C/O FIRM NAME** – If bids are to be mailed in "**c/o (care of)**" agent or manufacturer's representative, enter appropriate name and address.

9) **REMITTANCE ADDRESS** – Enter where you want payments mailed to, if different than bid/mailing address.

10) **BUSINESS SIZE STATUS** – Indicate size of business based on the following guidelines:
SMALL – Less than $3 million aggregate receipts for the previous fiscal year.
LARGE – More than $3 million in aggregate receipts for the previous fiscal year.
CERTIFIED SMALL LOCAL BUSINESS (SLB) – Only businesses certified as a SLB should check this box.
NON-PROFIT – Your business is listed as a non-profit organization.

11a) **MINORITY OR WOMAN-OWNED BUSINESS** – Must be at least 51% owned by minority or minorities (MBE), or a woman or women (WBE), who exercise the power to make policy decisions and who are actively involved in the day-to-day management of business.

11b) **OWNERSHIP DATA** – Enter name(s) and percentage(s) of ownership.

12) **CERTIFIED AS MINORITY-OWNED OR WOMAN-OWNED** – Enter the agency that certified your business. Mail or transmit a copy of your certification.

13) **DECLARATION** – Please sign and date.
